For indeed, if a Stone be not made of a Stone; it must needs be, that stonifying includes the Generation of some certain new Being: but every Generation presupposeth some kind of seed, which may dispose the matter to a Being, *in potentia*, or possibility: seeing nothing which is not vital, is able to promote it self to perfection. And therefore it would be a foolish and accidental perfection, which should proceed from a Body without an internal Guide, and an end appointed unto it. Therefore, if a Body be dispositively distinguished from the internal Efficient, and doth issue in its production, unto ends proposed unto it in Nature; then also the Etymologie of a seed, doth of right belong unto it: because it proceedeth wholly from an incorporeal Beginning. But this Beginning, shall easily be granted by me, to issue forth in vital things from the Image, or according to the Idea framed by the Conception or cogitation of the Generator, which therefore is called the *imaginative power*, or *faculty*. But that inanimate things have seminal Gifts implanted in their first Beings, which after the manner of the Receiver, do also proportionably after some sort, answer to the Imagination, the Sympathy and Antipathy of inanimate things do teach. For a *non-sensitive Body* (namely the Loadstone) must needs after some sort feel the Scituation of the *Pole* or *North star*; if it direct it self of its own accord unto it, but is not drawn by the *Pole* (even as in the *Book of the Plague*, I teach by manifest Arguments) Likewise that it feels or perceives Iron, if, neglecting the *Pole*, it by a Choice, inclines it self to the Iron; which particulars, least they should be here, after a tedious manner repeated by me, it is sufficient thus to have supposed them by the way.

Moreover, This very Idea and perfect act of a new Being, to wit, the seminal efficient cause, doth even in unsensitive things perform its office, no otherwise than if it were strong in Life and Sense; which Idea or imaginous likeness, cloathes it selfe with the Ayr of its own *Archeus*, and by meanes thereof, doth afterwards perfect the dispositions and Organs of the Body, and at length compleateth those things, which in the delineation of its own seminal Image, are designed it for Ends known to God alone. And in this respect also, every Creature depends originally on God. For this God hath freely put into living Creatures and plants, a seminal faculty of framing such an Idea: that is, a fruitfulness of multiplying and raising up Off-spring, by vertue of the Word (*Encrease and multiply*) to endure for Ages. The which, under the correction of the Church, I thus borrow from the Scriptures. In the Beginning, the Earth was empty and voyd: For surely, it was beset with a double emptiness or vacuity. The which, notwithstanding, is not so said of the Element of water. For the earth had not as yet minerals in its Bosom, if it were void. Indeed the earth was a meer and pure Sand, not yet distinguished by a numerous variety and ranks of minerals. But the Spirit of the Lord was carried upon the Great Deep of the Waters. Not indeed, that that carrying, was not an empty idleness wanting a myserie, or a voluptuous ease of swimming: but it contained the myserie of a Blessing, whereby the water might replenish the vacuity of the earth in one of its emptinesses, with Fruits: But on the other hand, might satisfie the vacuity of the earth, and fill up its emptiness by Vegetables and living Creatures. Therefore, before the Light sprang up; all mettals and minerals began at once, in the floating of the *divine Spirit*. Of which thing, first of all, the hidden lights of mettals, imitating the Stars, and the foregoing Testimonies, which are wont to shine by Night, in Mine-making Mountains, do perswade me. At leastwise, the Spirit of the Lord, which filled the whole earth, being now earnestly desirous of Creating, sealed by its Word the fruitfull Idea of its desire, in the Spondill or Marrow of the Abyse of the Waters, which in an instant, brought forth the whole wealthy diversity of Stones, Minerals, and Mettals, whereby it replenished the emptiness of the earth with much usury: which vacuity indeed, living Creatures and plants were not able sufficiently, as neither suirable to fulfill.

6 But the Pavement, or Plantae of the earth, which this most rich of-Spring of waters was entrusted with for the filling up of its vacuity, is called by *Paracelsus*, the *Trival-line*, the Womb that was great with Child with the seeds of minerals, wherein the Lord implanted Reasons or Respects, Endowments, and seeds that were to be sufficient for Ages. For so indeed, the wealthy seed of Rocky stones and minerals is implanted in the Water, that it may receive its determination and Ferment in the womb of the Earth. But what the Virgin Earth may be, without, and besides minerals, I have demonstrated in my Treatises of *Natural Philosophy*. But the most rich seed of this Store-house and Treasury, seems to be professedly neglected by *Moses*, least *Israel*, by attributing divine and immortal Powers to Fountains and Mountains, should sacrifice unto them. But besides, the sand or earth being on every side, continual to its self, having received a seed, arose into Hills and Rocks, and divided the Pavements of Stones. For, as the Rise of things began from a Miracle; so now it adhereth to its second Causes, that the invisible *Archeus*'s of things, and the hidden seeds thereof may testify, that they are likewise Governed by the intelligible World. For from hence it is, that the waters have remained gotten with Child through the desire of the seeds, and the Almighty hath disposed the Idea's of his pleasure, or Precept, through the Water. Yet these seminal desires of the water, do not fructifie through a successive propagation of one thing by another, after the manner of plants: but a seminal vertue lurking in the Treasures of the water, doth peculiarly stir up its own Off-springs from it self, and successively perfect them. For a seed or seminal and mineral Idea, is included in the water, which never goes out of it: but locks up and incloseth it self in that matter, until at length, under the maturity of dayes, that be made thereof, which

7 was born to be made of it. The operative Image therefore, in the waters, doth receive a sensible, and presently a fermentaceous odour from the flinty Mountain. But the flinty Mountain is a Plantae, Pavement, or space of earth: wherein great stones, small stones, and all minerals, draw their original out of the water; even as elsewhere concerning the original of Fountains. And moreover, that Odour is the Ferment, from whence a complete mineral seed doth at length, issue. From thence also, is every Rocky stone. But this seed is not in minerals by way of a Metaphor, a certain Equivocal thing, or proportionable resemblance, under the licentious allusion of Similitude. For

new flints and stones do grow in Fountains and Rivers. But whatsoever is made, and so long as it is in making, neither is as yet in its perfection intended by the *Archeus*, hath a seed in it self: so as that I may understand an Univocal or simple Nature to be in its own constituted parts. For the water being purely clear, having in it the seed and Ferment of a stone, becomes the Crystal of all Gemes. But if besides, the pure colour of a certain metall, or *Fire-stone* shall concur; it is made a Gemme, following the hardnesse and properties of its owne coagulated Body. For just even as Tinne (which affords to Painters a yellow colour, which they call *Masticot*) makes every mettall (its lead being taken away) bricke: So also it tingeth the hardnesse of Gemmes, or precious Stones. Therefore the *Adamant* or *Diamond* alone, affords a yellow powder or dust; and the powder of other Gemmes, is white. But if water nor being purely transparent, doth incorporate it self with a metallick colour, there is made a thick or dark stone; a *Jasper*, *Agate*, *Flint*, red *Marble*, *Marble*, &c. and that according to the requirance of the mixed seed.

In the mean time, Rocky stones are more easily dissolved than small flinty-stones; and do again of their own accord, or by Art, return into water (who converteth Rocks into pooles of waters.) But I say, that Rocky stones are convertible into a lime, and they sometimes perish of their own accord, into the nourishing juyce of Fields, and into Corny Beings or substances. In Quarries of stones also, a nitrous salt doth oftentimes voluntarily drop, with a perpetual distillation: to wit, that Rocky stones may return into their first matter. Even as, on the other hand, through a Rocky odour of the Ferment, the whole water passeth into a Rocky stone; or at least, as to a part thereof, wherein that odour, radically grew together in it: And that, as well in time of flowing, as of standing still in a pool. But it was not as yet, sufficient for the Divine Bounty, to have made from the Beginning, Rocks, great stones and small stones, and to have conferred a seed for propagating a new Off-spring: whereby small or flinty, and rocky stones should afterwards, be made of waters: But moreover, he would have it, that a stonifying seed, should in many things exceed their own vegetables, and should testify that those seeds were more powerfull in these, than themselves. For neither doth the seed stonify only, with the water subjected unto it: but moreover, through the odour of the stonifying seed, it makes the Body that co-toucheth with it, become a rocky stone, onely by touching upon it. For so the *Glove of Frederick the Emperour*, was stonified in one part thereof, to wit, in that part which he had for some time moistened beneath the water: but in the other half or moiety, being fenced by a graven Impression, it remained leather. So that, not onely Herbs, Woods, Breads, Iron, Egges, Fishes, Birds, and four-footed Beasts, are by a wonderfull *Metamorphosis*, made a Rocky stone; But also, as *Ambrose Pareus* witnesseth, there was at *Paris*, a humane Young cut out of the Womb, of a mature bignesse, that was turned into a Rocky stone. His Toe was broken, and the Tendons, and joynts of his Bones appeared within. And likewise, his Gum being broken (for he was of a gaping, and as it were howling mouth) shewed a Tooth underneath in the sheath of the Cheek-bone. The which, a Friend testified to me, who for the sharpening of Instruments, in preparing Instruments designed for *Mathematical demonstration*, is wont oftentimes to make a Whetstone in the back of this Young.

So likewise, Histories makes mention, that in Vaults nigh the City *Pergamum* (now called *Pergamo*, or *Bargamo*) there were some dead Carcasses found, to wit, of those whom the fear of War had forced into hidden places; that they were I say stonified from their superficies, even to their Center. From whence, many particulars worthy of note, do arise. 1. That rocky stones are generated of their owne and proper seed: and that they afterwards consist also, of another stonifying seed: that is, such kind of seeds do not onely transchange the water, as it were their proper and immediate Object: but and also other strange Bodies, which have drawn in the aforesaid seed onely in way of an Odour. 2. And that therefore, those strange Bodies ought at the least, to bear a co-resemblance in something, even in their remote matter. Seeing they have nothing common at all, besides that principating matter, which in rocky stones, is meer water. For neither otherwise could the Fruits of divers Elements, differing at least, in the whole kind, light together into one. 3. But that rocky stones are not composed of a coagulable *Tartar*, as of their proper and near matter: but that they arise from a proper seed, which was bred to stonify any thing (even of a matter not disposed unto a rocky stone.) 4. That the stonifying seed, from whence Herbs, Birds, a nest, Leather, &c. do become a rocky stone, is of a greater efficacy, than otherwise the seeds of Vegetables are, which do fore-require a matter disposed by the

- the Generater. Therefore every Land doth not bring forth all things. But a rocky seed, snatcheth to it anybodies, even those that are far estranged from it self. And then the other seeds require, that the matter subjected unto them be reduced unto a tough or slimy Liquor, and such as is for receiving of the seed; which Liquor, they have called the *first matter of Generation*; and they require, that every figure and comeliness of the foregoing composed Body, be also destroyed. But a stonifying seed doth with a Reservation of the humane figure, stonifie the man wholly throughout the whole, to wit, as well his bones as his skin, without an intermediating putrefaction, or dissolution of the matter. 5. That a stonifying seed consists in a stony odour alone, which is an incorporeal and invisible Ferment. 6. That the matter of a Tooth, is not meerly bony: but a middle or neutral matter between a Bone and a Rocky stone. And therefore also a Tooth doth by its co-touching, at length stonifie whatsoever shall the more stubbornly adhere unto it, whether that pulse shall be of that which is made of Bread, Flesh, Potherbs, Fish, Apple, or Pease, &c. That is, although in it self, nor of it self, it hath not any disposition unto the making of a rocky stone. This seed I say, hath notably deceived *Paracelsus* and his followers with the name of *Tartar*. For the stone of a Tooth is not dissolved in boyling water, like *Tartar*: Neither is the Generation thereof of, most near akinne unto the *Tartar* of Wine; but it is a neutral Animal stonification, made indeed from a stone-like odour and seed, which the pulse adhering to the Tooth, drawes to it, by touching. 7. Hitherto hath the speculation of Hornes regard; For the horne of a Cow, as also the pantafles or hooves of Herds, and of the flock of lesser Cattel, are by a proper and simple name, of an horny matter. But the horne of a Stag, is partly of a bony matter, and partly of a wooden matter: and so that also therefore it intimates Thornes and Branches, and falls off yearly, by reason of a retained property of leaves, and of a wooden part. *Ivory* also hath a great part of bone, and another of a stone, or of a Tooth-like form. 8. That although many Bodies do become rocky stones, in Fountains: yet that comes not to passe, without a remarkable stonifying odour. For therefore, as many things as are stonified, are tranfchanged by the odour of the place: But not that the rocky stone sends forth from it self, a seed like a Generater. 9. And that therefore, the original seed of the rocky stone, was immediately sown by the Creator, and constituted in places, being sufficient for a sufficiency, unto the end of the World. 10. That if stonifying stands not in need of the device of *Tartar*, much lesse surely doth the Generations of Diseases.
- 14 11. That some Insects (especially the Toade) although they are bred in rocky stones themselves: yet they do not become a rocky stone, even as otherwise, almost all other things do: For that, they have received a vital *Archens* by way of a separation from the stones themselves: no otherwise, than as the *Fire-stone*, or metal, is separated from the stony veines wherein they are bred, and do keep their unspotted matter, dissolveable. Therefore that separated *Archens* remains unconquerable by a rocky seed.
- 15 12. That it is a false Maxime, that there is not made an introducing of any form, unlesse from a fore-existing disposition of the matter. For truly, a rocky stone is immediately made of subjects, even diuers in kind, without a co-melting of the matter. For indeed the *Magicians* of *Pharaoh*, when they had seen the Gnats to proceed immediately from the dust of the earth, which they had known to be the immediate Offsprings of the water, they cryed out: *Here is the finger of God*; because they could not imitate this effect. For since there is a most difficult return of earth into water, they knew, that it was a far more famous thing for Gnats to be made of the dust of the earth, than for a Serpent to be made of the Rod, and this of that: or for Frogs and Blood to be made of water. Which difficulty Satan well knowing, said not: *Say or command thou, that bread be made a stone* (for this happens in Nature immediately) but, *that those stones be made bread*. From whence indeed, he had divined of the Omnipotency of *Christ*. For as through a stonifying seed, having arisen from an hoary putrefaction of the bottome, shell-fishes are fenced with a stony crust: whose seed is not so much propagated by a sexual wedlock, as by the very fermental putrefaction it self, of the bottome; and therefore a posterity growes to their shells from without. So also, there are other Insects, whose *Archens* could not be incrufted, nor vanquished by a stony seed. From a like cause, as the Toad drives away from him all troublesome stonification from without. Yet such kind of wormes are not sufficient for curing of the Stone; Because the last Life of these (under which, a resistance against the rocky seed layes

layes hid) hath vanished away before it be received into the use of Medicine.

Also, a hoary putrified stony odour; if it shall light on the vegetal juyce of the earth (which *Paracelsus* calls *Leffas*) stony Pavements arise under the earth. A man also being shut up in a fermental putrified place, is first choaked with a stony odour; which odour afterwards passing through his Arteries and solid parts, transchangeth the dead Carcase, before it can putrifie into a rocky stone. For so the earth pierceth the vegetal juyce with a rocky odour, and a stony plant ariseth, as it were out of a transplanted vegetable seed. As is manifest in *Coral*, and the mosse thereof. But from whence had the Young, according to *Parvus*, drawn the odour of a stony seed? but that happened not at first, by vertue of a rocky seed: but there was made a transplantation, through the force of the teeming Mother, who the more attentively admired a stony Engraving; otherwise, the Young being framed and transchanged into a rocky stone, a stony odour afterwards issued from thence; whereby it came to passe, that almost the whole womb of the Mother, together with that Young, became stonified. For as smoak pierceth and tingeth fleshes that are moist and compacted with Salt, from their Circumference even to their Center: so also doth a stony Odour, Flesh; To wit, that of a dead Carcase there may be made a true mineral Rock, having nothing common with the stone of man: and the which therefore I will hereafter with *Paracelsus*, name *Ductech*, by reason of its singular nature and properties from all other rocky stones. But fume or smoak, although it may tinge fleshes: yet it transchangeth them not. Wherefore, from thence it is sufficiently manifest, that, not every odour is for the transchanging of a thing; but that onely, whereunto a Ferment cometh: from whence the odour becomes wholly great with Child of the seed.

Bodies therefore are stonified, indeed naturally, by their own seed, but plainly after a monstrous manner; they being supposed, to be strangers in kind, because they are stonified by a forreign seed of the place. Standing pooles of water do thus incrust shell-fishes, which co-touch with the bottome, by reason of the putrified hoary odour of the bottome: Insects swimming on the water, not so. Therefore waters that swiftly run, do for the most part, want such little Beasts. Crabs also, are not found but in stony places: because other places are destitute of the Ferment of a rocky stone. About the Year 1320, between *Russia* and *Tartaria*, in the Altitude of 64 degrees, not far from the *Fen* of *Kitaya*, a Hoorde or Village of the *Baschirdians*, is read to have been transchanged wholly into rocky stones, together with all its Herd of Cattel, Waggon, and Furniture on Armory. And Men, Camels, Horses, Flocks, and all the concomitant kind of Waggon, and Armory provisions being grown together, even at this day are with a horrid Spectacle, said to stand as yet stonified under the open Element. But if a miracle be absent from thence; surely that whole Country is nothing but a continued Rock, passable or holie with chinks: the which (the Wind being silent for many dayes, and the Ayre from above, pressed down) a strong stony putrified hoary odour (such a killing odour as is beheld to be in some Burrowes or Mines of the Earth) might have breathed forth, and killed its walking Inhabitants in one night: which at length, by reason of the cold of the place, restraining putrefaction, transchanged those Creatures which but lately before it had killed, into a rocky stone. No otherwise than as those of *Bergamo*, in the Vaults, and the *Glove* in the Fountain. And therefore, the drink of such Springs is exceeding unwholsome; Because it disposeth the *Archeus* into a stony disposition; molests with gripings or wringings of the Bowels, shortens the Life; and therefore kills the Midriffs, before that in drinking, they are transchanged into a stone. In the red Monastery of *Zonia*, nigh *Brussels*, and in the Vestry of the Temple, some Springs breath forth, which apply or fastens stones to the Wall, contrary to the Proverb; *A drop by often falling, hollowes stones*. For the stones that are grown to the Wall, do oftentimes shake off by a Crook and Hatchet. But the Monks complain, that they suffer frettings or wringings in their Bowels, unless they daily use *Daucus* or wild *Carrot-seed* boyled in their Ales. As the Odour of wild-*Carrot*, tames and represseth a stony odour, Therefore let young Beginners learn, that the rocky stone hath its seeds, no lesse than other things, in its middle life, under the Cloak of a Fermental odour, but not in a Tartarous coagulation of the matter.

CHAP. II.

The Causes of Duelech, or the stone in man, according to the Antients.

1. The rashnesse of the Schooles. 2. The supposed matter of Duelech, and the effects of the same. 3. Those causes of the Antients are rejected. 4. Thinking hath deceived the Schooles, whereby they supposed the effect to be the cause it self. 5. The progresse of humane nature is every where alike. 6. The error of the Schooles, in the causes of Duelech, is proved. 7. Some Rashnesse, dislemencies and sluggishnesses of the Schooles. 8. A faulty Argument of the Schooles in the efficient cause of Duelech it self. 9. Arguments drawn from sense. 10. That Duelech is made of the Urin it self; but not of the contents thereof, distinguished in opposition to the Urine. 11. Consequences upon the ignorance of causes. 12. the wearisomenesse or grief of the Author. 13. An handicraft operation of the Author, rejecting the causes of the Schooles assigned to Duelech. 14. A Maxime opposite to the Schooles. 15. The vanity of Tartar in the Stone. 16. Pray ye, and it shall be given unto you.

THe hoard of *Tartars* being already long since cast out and re-cleaned elsewhere, which through the Captain *Paracelsus* had invaded Diseases. I must now in this place, wage War with the Precepts of *Galen*, in the causes of *Duelech* or the stone in Man. For indeed, the *Schooles* having forgotten a quaternary or fourfold number of natural Causes, have made mention of two causes onely, for the Generation of *Duelech*. And so that likewise, they agree with me, in the name and number of Causes onely; but not in the thing it self. For truly, they teach, that the matter, and efficient, are the parents of the stone. And so, their own conscience urging them, they deny its Form and End, or Causes; or do either insufficiently treat of the stone, or at length, exclude *Duelech* out of the Race of natural things. Yea, seeing they will have every efficient cause to be external, they leave it to be concluded by their young Beginners, that *Duelech* is naturally constituted, and doth depend onely from an external efficient Cause.

2 The *Schooles* therefore call the matter of the stone, a certain *Muscilage*, which they call a *slimy* or *snivelly phlegme*: but they will have the efficient cause of the stone, to be Heat, as well that external Heat of the Bed, &c. as that of the Bowels it self being badly affected. Wherein, at the very entrance, they forsake their own Patron; who denies the efficient cause in natural things, to be internal. *Duelech* therefore, shall be caused onely by heat.

3 I am of a contrary judgement. I have shewed by handicraft Operation, that no muscilage, as such, ever is, hath been, or can be, the matter [ex qua] or [whereof] of the Stone. But if the muckinesse it self, be sometimes laid hold of by the true matter of the stone, and be shut up under the same: it stonifies indeed, from the seed of *Duelech*, together, otherwise, with the proper matter of *Duelech*, but not by reason of its being a muscilage, or as it is tough and slimy.

4 For first of all the undistinct observance of the *Schooles* their experience, hath deceived them. For they beheld the snivelly urine of those, who now carried a stone in their Bladder: and they presently thereupon, suspending a further diligent search, cryed out, *Victory*; and bare in hand, that they had found the immediate and containing cause of the Stone. Truly, first the *Schooles* are miserable: but much more miserable are the infirm or sick. For if they had once looked behind them, they had easily seen, that the stone being rightly cut out, that and before accustomed balast of muckinesse or snivel, doth also presently cease in the urine of that infirm person. For from hence the *Schooles* might have been able certainly to know, that if, that muckinesse, which is voided before, while the Stone was present, were any kind of cause and matter of the same, that

that should surely be made, either from the Bladder it self, or from the stone, or should be sent unto the Bladder from elsewhere. If therefore it was sent from elsewhere, verily when *Duelech* was cut out, it ought as yet to be bred, sent thither, and daily voided forth: since the cutting and taking away of the stone, hath respect onely to the Bladder: but in no wise, unto the part which is otherwise remotely distant, the bringer forth, and sender of continual snivels. But if such a muckinesse proceeded from the stone, or next from the Bladder, it shall not any way, be a cause; but rather an effect of the stone, presupposing the stone to be present. For the Bladder is hurt in its digestion, by so cruel and troublesome a Guest as the stone is; wherefore as impatient thereof, it continually weepes out the undigested part of its owne nourishment, because it cannot perfect and promote it: and therefore it successively sends for new. Therefore that snivel is not the matter [whereof] of the stone: but the mournfull effect hereof. And therefore they badly accuse that muscilage for the matter of the stone: For they see, and do not know what they have seen. They call phlegme, one, and indeed a separated humour of the four first humours arising in sanguification or blood-making, which is the last nourishment in digestion, and the immediate and spermatick or seedy nourishment of the solid members proceeding from the venal Blood, being totally digested, it being degenerated in its passage, by reason of the indisposition of the part to be nourished. For the stone hath nothing which is vital in it self, nor hath it any thing vital out of it self, which may afford, or stir up a muscilage from its seed; And much lesse is Nature solicitous of, or doth intend the increase of the stone, that from its owne continual nourishing warmth, it should think of procreating that, whereby it may intend and confirm its enemy, and own destruction within; especially, if the direction of the same doth depend on an un-erring intelligence or understanding.

For the *Schools*, if ever they made trial from Charity towards their Neighbour, or a care of knowing, they ought at least, to have run over unto some such like things. To wit, that a web, or moat in the eye, doth against ones will, stir up continual teares. That the Bone Ethmoides, or straining bone being stopped with snivel, doth continually provoke the liquor Latex, and powres forth snivel, in a Pose. That the Squinancy also, thus froaths up an uncessant and mucky spittle: even as also, that the bloody flux drops down the proper snivel of the Bowel, together with blood. For then, they had easily seen, that snivel is made, and doth continually issue from the Bladder, being thus besieged by *Duelech*: but not that the Tear is the cause of the web in the Eye, or that the watery Latex being largely powred out, doth stop up the spongy bone in the forehead: or that mucky spittle doth procreate the Squinancy. For such is the perpetual commerce of the whole Body, that a member being hurt, or the power thereof, its Inhabitant: the functions of the same do go astray, and its digestion is forthwith vitiated, and the nourishment thereof, being otherwise lively, doth for the most part, degenerate, that if it declines not into a spermatick disposition; at leastwise, it doth into a mucky or snivelly one. For so, the Bladder weepes out the continual muck of its owne defiled nourishment, while the stone is present: and ceaseth so to do, when it is absent. Therefore by such a muck being granted, they endeavour too frivolously to prove, to wit, that the material cause of the stone, is that, which, the stone being there placed, is by accident, and occasionally, effectually made. In the next place, if such a mucky snivel, being bred in the urine, were the matter [whereof] of the stone, and heat were the proper efficient cause thereof: and that both these causes being present, were sufficient; truly seeing the effect, when sufficient causes are granted, doth unexcusably, of necessity succeed: therefore, all such mucky snivel, would of necessity, become a stone in the Bladder: No otherwise than as the whole milk simply, is coagulated at once by the Runner. And so, the Bladder, should presently be filled up with one onely stone, or it should be false, that the causes being granted, which are requisite for the constituting of a thing, the thing it self must needs be made, or be. Nevertheless, in the termes proposed, that muckinesse being continually present (at leastwise successively) under the heat of the Bladder, doth not wholly passe over (as otherwise should be required) into a stone, according to the similar, simple, and homogeneal unity of it self: but is wholly voided out. Therefore the two constitutive causes of the Stone, assigned by the *Schools*, can neither be true, nor sufficient ones.

Wherefore, I greatly admire at so great a sluggishness of diligently searching, nor that in so many fore-past Ages, there hath been any one of that curiosity, who hath once hitherto dried that Snivel voyded out of the Bladder, with any degree of heat. For

he had learned and certainly known, whether a stone would ever be made thereby; or indeed, any bricke sand-stone. even as if he did dry the snivel of the Nostrils in a plate of mettall. It is therefore an intolerable thing, that none of the *Schooles* their Professours, hath hitherto cherished the Urine, together with the aforesaid Muscilage, with a due lukewarmth, that he might have learned, that the stone grew together in Urinals or Chamberpots, not from the snivel: but well or successfully in respect of the Urine. I am deservedly angry, that in things of so great moment, from whence, notwithstanding an infernal sentence of punishment hangs almost over the head of the *Schooles*: the extinguishment of Charity, yea, and the very denial of Knowledge are manifestly proved: yet that they have never hitherto considered, that as long as they live, nothing can ever be dried up or wither in the Bladder: or that ever the action of heat is required for the hardening of the stone, that the watery parts should be consumed; but that the more grosse parts, should at once, by the same endeavour, be more toughly co-thickened. For otherwise, if they suppose the necessity of their efficient heat to be such, that like Lime, in its maturity, the stone being cherished by heat, doth grow together; Now the *Universities* confound themselves, while they see, that clear and transparent urine, layes aside its sandy or stony crusts in the cold, and in Urinals or Chamberpots. They behold (I say) Stones to be brought to maturity, without heat; and also that the Urine of healthy persons, doth affix sands and scaly plates on Urinals. Neither likewise, doth this very thing thus come to passe, if the Vessel being close shut, the urine be all the day long, most grossly cherished by heat: therefore it is the part of ignorance, that by all the clear-sightednesse of Physicians, the difference hath not yet been discerned between the coagulation of a flint, in a Spring or River, and the drying of Clay that is

8 made by heat. Learn ye therefore, oh ye *Schooles*, of me an unprofitable and the least of young Beginners: that heat is through occasion of the loines: but not the occasion of the stone, or of the adhering sand. That is, the stone is not from heat, but heat from the stone: even as heat ariseth in the finger, from a Thorne being thrust into it; but the Thorne is not there made by heat. For ye have heard the wailings of the Strangury or pissing by drops, but not of heat in the stone of the Bladder: even as otherwise, ye have heard complaints of heat in the Disease of the stone of the Kidnies; wherefore, if heat were the efficient cause of the stone: there would be far greater complaints in the stone

9 of the Bladder; Because this stone, by reason of its greater hardnesse, should also be the of-spring of a greater heat and drying, than that of the Reines. And the rather, because that, doth almost continually swim in the Latex or urinal Liquor: whereas the Kidney, doth not any thing detain the trans-liding urine. Surely the stone of the Bladder should have need of a violent heat. For the diseased complain of a sharpnesse, burning heat, and pain. But these things are not felt in the nest of the Stone, even as in the Nut of the Yard. Therefore Children have known how to distinguish of the sense and place of sharpnesse and pain: but not the *Schooles*. But moreover, although the urine may seem biting and sharp as if there were the burning of fire, as in the Strangury: yet being voided, it is not any thing more hot, or sharper to the tast, or more salt than it was wont, or is meet to be. There is an apparent burning and tartnesse of the urine: not indeed, from a true heat, or any sharpnesse of the urine: but onely, by reason of the foreignnesse of some certain small quantity of sharpnesse, through a Ferment being co-mixed therewith: which thing, the Strangury reacheth, being contracted by new Ales, and those as yet fermenting from a sharpnesse. Therefore *Mace*, or *Saffron* being taken (for they must be sharp and hot Medicines, yea reaching to the very place, if they ought to help; and therefore, by their odour testifying their presence in the urine) the aforesaid burning heat for the most part, ceaseth.

10 For it is a Philosophical truth, that the stone increaseth by the same causes, whereby it ariseth, and so on the other hand: But stones being joined to our Chamber-pots, do confirm that the stone is naturally made, and at leastwise, without an actual heat of the Chamber-pot and encompassing Ayr: or that heat is not required unto its constitution: therefore the stone is made and increased materially of the urine; but not of a vital muscilage: nor that it doth require heat for its efficient cause; and much lesse, an excesse of the same heat. For the mucky snivel doth not appear rejected or cast forth, unlesse the stone be first present in the Bladder: and so, the cause, as flow, should have come after its effect. For I have observed, that if any one did pisse through a thick Towel, and found not a muscilage herein: yet but a few houres after that time, his urine being strained thorow, and filtered into a clean Glass, had yielded a thin and red sand, equally adhering thereunto; neither also, had it fallen down more plentifully about the bottome, than it

stuck

stuck about the sides of the Glasse. And that thing had thus happened in a cold encompassing Ayr. Wherefore, even from thence, any one ought to be more assured, that that sand had not gone forth with the urine, in the beginning of his making water (because it was not yet bred) neither that it was actually in the urine. For otherwise, it had stood detained in the Towel, however thin it had been, like the atomes of *Potters earth*. Or if the Towel being not thick enough, had deceived him: yet at least, it had presently rushed unto the bottome, in the likenesse of sand, or a settlement: neither had it affixed it self in its making, in so great a grain, and with so great a distance of equality, to the sides of the Vessel: Because it had wanted a glew, whereby it might have been able to glew it self thereunto. In the next place, seeing that sand wants a glew throughout its whole Superficies, except in that part, wherein it adheres to the Chamberpot or Urinal: it is sufficiently manifest, that at one and the same instant, wherein that sand was made, it was likewise also glewed thereunto. For from thence, any one ought to be the more assured (if he had ever roughly laboured in a diligent searching out of the truth) that since that sand applied it self to the Glasse of its owne free accord, that it was also generated, far after the making water, to wit, in the immediate instant before its affixing: but that, it being affixed, however the most small it was in it self, it afterwards encreased by additions. Which effects, indeed, as they are wrought by a common nature growing or glistening in the urine, and not from a particular atome of sand, which affixed it self to the Vessel; Hence also, it equally departed, and that, at once, out of the whole urine. For from this so ordinary and daily handicraft Operation, if the love of Health were cordially seated in the *Schools*; they ought for some Ages before now, to have known (nor indeed from an argument drawn from a Similitude, and far fetcht; but altogether from the Identity or sameliness of the urine and stony sand it self) that for as much as that sand had grown together from the matter of the urine, to wit, of the same matter, from whence the stone also was: and that indeed though a muscilage of the matter, and heat of the place were absent (for the pewter Chamberpot stands in the cold encompassing ayr) and likewise without the suspicion of the affect of the stone, or an infirmity of the pisser (for also any the unblamed urine of healthy persons, generates this sand and applies it self to the urine) therefore the sand and stone in us, proceeds from stony causes: to wit, the same, from which the urine becomes of a sandy grain in the Glasse without us, being also healthy persons. Which thing, being by me ¹¹ seen, I seriously sighed, and certainly knew, that the *Schools* had erred in the knowledge of the cause, and that they do even to this day stumble in curing of the Stone; the which, notwithstanding, they rashly assume to themselves, and presume of. I greatly bewailed the stupidities and false devices of so many Ages; and more, that the unhappy Obediences, strict Clientships, paines, and deaths of the sick; the untimely destructions of Families; and lastly, the spoyles of Widows and Orphans, had happened under unfaithful and ignorant helpers, who deceived the World with the name of Physicians.

For then I knew in good earnest, that I knew nothing, who had learned my principles from such as knew nothing. I therefore disdaining the long since blinde ignorance of my presumption, cast away Books, and bestowed perhaps two hundred Crownes in Books, as a Gift upon studious persons (I wish I had burned them) being altogether resolved with my self, to forsake a Profession that was so ignorant, if not also, full of deceit. ¹²

At length in a certain night, being awaked out of my sleep, I meditated, that no Schollar was above his Master; yet I resolved in my mind, that many of my School-fellowes had exceeded their Teachers: but the truth of that Text was brought unto me, namely, *That a man did watch and build in vain, unlesse the Lord did co-operate*. I knew therefore, likewise, that we do teach any one in vain, unlesse the Master of all Truth shall also teach us within, whom none of his Disciples hath ever surpassed. Therefore I long and seriously searched, after what manner I might attain the knowledge of the Stone, from this Master. For truly, I most perfectly knew, that Authors had not so much as the least light, and that therefore, neither could they give me that Knowledge: But I confessed my self to be a great Sea of ignorance, and an Abyffe of manifold darkneses, and to want all light; unless it were one onely Spark, that so, piercing my self, I might acknowledge, that nothing was left unto me. And so, although I frequently prayed, yet presently after, I despaired in my mind. At length, making a thorow search of my own self; I found, that I was my self, free from the stone. For I had never felt any pain of my Reines, or had taken notice of one onely sand therein: Yet I had now and then beheld that sand adhering in the Urinal, yet without any sliminess, or disturbance of heat, ¹³

or local pain. For I wondered, that having powred out my urine, a sand should stick to the sides of the Urinal, and be so fastened thereto, at so great a distance of equality, that it denyed all fore-existence of matter falling down. It once happened, that I was conversant with some noble Women, the Wives of Noblemen, and so also with the Queen her self, from the third hour after noon, even to the third hour after midnight, at London in the Court of *Whitehall*; For they were the Holy-day-Evens of Feasting in the Twelvedayes. But I made water, when those Women first drew me along with them to the Kings Palace: wherefore, for civility sake, I with-held my urine for at least 12 houres space. And then, having returned home, I could not, even by the most exact viewing, find so much as the least mote of sand in my urine. For I feared, least, my urine having been long detained, and cocted beyond measure, would now be of a sandy grain. Wherefore I made water the more curiously through a Napkin; but my urine was free from all sand. Therefore the next day after, in the morning, I pissed new urine through a Towel, and detained it in a Glasse-Vrinal as many houres (to wit, twelve): And at length, I manifestly saw the adhering sand, to be equally dispersed round about where the urine had stood: lastly, pouring forth the urine, I touched that sand with my finger. And being perfectly instructed by my owne experience, I concluded with my self; That forasmuch as the urine was by me the pisser, detained for 12 houres space, and yet it contained no sand, neither that I had cast it forth: and that otherwise, in the lesser space of a day, sand had been condensed in my urine, and fastened to the Glazen-shell, in the encompassing ayr of [the Month called] *January*: I knew more certainly than certainty it self, that a sliminess of matter was no way required for that sand, and that the heat of the member did in no wise effect the coagulation of the Stone. I thereupon taking my progress home, cast from me, the Doctrine of the *Schools*, and presently the Truth took hold of me. For I being confirmed, and no longer staggering by reason of doubt, believed, as being certainly confirmed, that the internal and seminal cause of the stones in men was unknown to Mortals. With a great courage therefore, I again disdaining all the Books of Writers, cast them away, and expelled them far from me. Neither determined I to expect the ayd of my Calling from any other way than from the Father of Lights, the one onely Master of Truth. And presently I gave a divorce to all accidental occasions and mockeries of *Tartar*: and also to any whatsoever Artifices, more than those which more shew forth the course of Nature. Because I knew that Nature doth no where, primarily work out seminal transmutations by heat or cold, as such; although she be oft-times constrained to make use of those, for the excitements, or impediments of inward Agents.

I knew therefore that vain were the devices of *Paracelsus*, concerning *Tartar*; to this end at least, invented by him, that he, as the first, might be reckoned to have thrust in the Generation of the Stone into the universal nature of Bodies and Diseases, by the history of stones feigned from the Similitude of the *Tartar* of Wine. For although he perfectly cured *Duelech* (as his Epitaph doth premonish) yet he obtained not the speculative knowledge thereof in the like measure, as he did the most powerfull use of an *Arcanum*. For so, very many experiments, wander about amongst Idiots: the causes whereof they notwithstanding know not. Therefore the help of Books forsook me, and the voyce of the living forsook me, which might teach me, while present; yet I knew, that *no was to the man, that trusted in man*. 'Good God, the Comforter of the poor 'in spirit, who art nearer to none, than to him who with a full freedome, resignes up himself and his Endowments into thy most pleasing Will; and seeing thou enlightnest none 'more bountifully, Oh Father of Lights, than him, who acknowledging the lowliness of 'his owne nothingness, puts confidence onely in the good pleasure of thy Clemency. 'Grant thou, Oh thou profound Master of Sciences, that I may rather be poor in spirit, 'than great with Child or swollen through knowledge. Grant me freely an understanding 'that may purely seek thee, and a will that may purely adhere unto thee. Enlighten thou 'my nothing-darknesses as much as thou wilt; and no more, than that I may suffer my self 'to be directed according to length, breadth, and Depth, unto the Reward of the Race proposed be thee unto me; nor that I may ever in any thing decline from thee to my self. 'Because I am in very deed, evil; Neither of my self, have I, am I, can I be, know I, or 'am I able to do any thing else. Unto thee be the glory, which hath taught me to acknowledge my owne nothingness.

CHAP. III.

The Con-tent of Urine.

1. The Art of the Fire is commended. 2. An Analysis or resolution of the Urine.
3. The Author disappointed of his hope. 4. A second handicraft Operation.
5. A third, which hath taught the coagulum or Runnet of the Stone, and some other remarkable things. 6. Some wayes or manners of condensing. 7. In the lime of rocky Stones, there are two divers salts: for neither could it otherwise ever become a Stone. 8. The error of Galen concerning Ashes. 9. The Author, when he had learned nothing from coagulated Bodies, at length, examined divers spirits. 10. The error of Paracelsus concerning Tartar. 11. An examination of salts. 12. The highest vertue of Vegetables. 13. From whence a salt ariseth in urine. 14. Duelech doth not stonifie after the manner of lime. 15. What the Sunovia is. 16. An examination of fermental savours. 17. Paracelsus is taken notice of concerning Mercuries. 18. An abuse, in forbidding the use of salt. 19. The handicraft Operation of the salt of urine. 20. The vanity of Turnheisser, his signifyng by the urine. 21. Two the more fixed salts in urine. 22. The differences of both those salts. 23. The difference of the Volatile from the fixed salt of the urine. 24. The ferment of the stomach is not any kind of sharpnesse whatsoever. 25. Burnt urine yielded not an Alkali to the Author. 26. The Vulnerary drink of a certain Countryman. 27. That an Alkali doth not fore-exist, but is made in burning. 28. A digression unto some ranks of Simples. 29. The calcining of Harts-horn is a thing of notable blockishnesse. 30. Sea-salt, whether it hurt those that labour with the stone. 31. That salt is not to be forbidden for its owne sake, as neither for its spirit-sake. 32. The fittest salt for eating. 33. A wonderfull handicraft Operation in the distillation of urine. 34. The judiciary part in Urines, why hitherto, false. 35. What the stone being distilled may teach. 36. Earth, together with the spirit of Urine, never makes Duelech. 37. The constituting principles of Duelech. 38. How sands are made in the Urinal or Chamberpot. 39. The Confirmation of the stone, is fabulous. 40. A stone of a wonderful bignesse. 41. Paracelsus is ridiculous in the Stone of a Thunderbolt. 42. Duelech is made of meer volatile things. 43. Three spirits concur in the Urine, for the nativity of Duelech. 44. Volatile Bodies, are oft-times through their concurrence, presently fixed together at once.

WE read in our Furnaces, that there is not a more certain kind of Science in Nature, for the knowing of things by their radical and constitutive causes; than while it is known, what, and how much is contained in any thing. So indeed, that the knowledge, and connexion of causes are not more clearly manifest, than when thou shalt so disclose things themselves, that they bewray themselves in thy presence; and do as it were talk with thee. For truly, real Beings, standing onely in their owne Original, and succeeding principles of feeds; and so, in a true substantial entity, do afford the Knowledge, and produce the cause of knowing the nature of Bodies, their middle parts, and extremities or utmost parts. Because they are the cause of the Generation, existence, and thorow changing of them according to their Root; Because (as Raymund testifies)* 'However, a Logician may have a profound wit, * Of his Testament, Chap. 26. 'discourseable, or natural, concerning things without: Yet he shall never by

by any reason, which comes unto sense, be able directly to know, nor judge, with what kind of nature, or vertue, through a fortitude or strength within, the multiplication of grain possesseth it self, so as to grow or increase upon the earth, unless by reason of a similitudinary example drawn from observation. Neither shall he ever know, after what manner a seed buds, growes, and collects fruits in the earth, unless he shall with an experimental Doctrine, first enter into our natural Philosophy, and not that Sophistical, discursive one, which is bred in *Logicians* by divers phantastical presumptions: who with the Prognostications of Sequels, contrary to the power of Nature, make many stubbornly to erre in the sophistication of their mind. Because by our handicraft knowledge, the understanding is rectified by the force of experience, in respect of the sight, and of a true mental Knowledge. Yea, our experiences stand over the head of the phantastical or imaginative proofs of Conclusions, and therefore, neither do they endure them: But they shew that all other Sciences do lively enter into the understanding: From whence we afterwards understand that thing within, what it is, and of what sort it is. Because by such knowledge, the Intellect stands unclothed of superfluities and errors, which do ordinarily remove it from the Truth, by reason of presumptions, and prejudiced or fore-judged things, believed in the conclusions. For from hence it is, that our *Philosophers* or followers, have directed themselves to enter through any kind of Science, into all experience, by Art, according to the course of Nature in its Univocal or single Principles. For *Alchymie* alone, is the Glass of true understanding; and shews how to touch, and see the truths of those things in the clear Light. Neither doth it bring Logical arguments: because they are too remote and far off from the clear Light. And therefore, the *Smaragdine Table* hath it; By this kind of demonstration, all obscurity will flee from thee; and all the strong fortitude of strength, which vanquisheth subtile things, and pierceth all solid things, will be attained by thee. Wherefore, I am called *Hermes Trimegistus*, as having the three (that is, all the) parts of *Philosophy*, and the perfection of the whole world. Thus he. Between praying therefore and knocking, a mean, in naturals; namely, of seeking by the fire, is supposed.

2 I indeed hoped, by searching into the Contents of urine, visibly to know it; no otherwise surely, than by a true solving or resolution of urine. Therefore first of all, I distilled my own urine, being first kept in a wooden Vessel, untill that at length, it voluntarily conceived a ferment, and boyled up; no otherwise than as Wines do: so that my ear could perceive the boyling. About the end whereof, there was a little burning water distilled from thence. But of the remainder, I collected a most white salt, of a sharp and uriny, stinking odour. But I know not, whether there be any thing more subtile in the whole nature of things. It being a noble Remedy against the Jaundise, and other Diseases. I endeavoured, by this Salt, to dissolve *Duelech* in a Glass: But the event answered not my attempt.

4 Again, my own urine was putrified anew in Horse-dung. That the unlike part thereof might incline to a separation of its last life. Then I distilled it, by cohobating it four times according to the prescription of *Paracelsus*: and I found frequent Crystals therein, being yellow and of a sharp top. The which, although they might be of conducement against the old obstructions of Excrements; yet of none, against the affect of the Stone.

5 Thirdly, I mixed the spirit of my Urine, with *Aqua vite* dephelegmed or refined: and in a moment, both of them were coagulated together into a white lump or gobbet: yet wondrous swift or volatile, and subtile. My Eye, in the first place, there taught me; That the spirit of Urine was an unparallel'd and great Runnet; because it was that, which was for coagulating of *Aqua vite*. 2. That in coagulating, it had separated the sluggish and watery part, which swam upon the aforesaid white lump, perhaps, no otherwise, than as in coagulation of *Duelech* from the rest of the body of the urine, and so, that it perfected its coagulation in the middle of the waters. 3. That the curdy Runnet or spirit of Urine, had undissolveably knit it self to the spirit of Wine. 4. That it is not a perpetual truth (the which notwithstanding, the *Schools* hand forth instead of a Chymicall Maxime) that every sharp coagulating Body, did by the same endeavour dissolve its own Compeere. 5. That the spirit of Urine had not coagulated it self in the Glass, according to the powder of a beaten *Duelech*: but onely, that it had mingled and coagulated it self together with another thing; namely, with the spirit of Wine. 6. That if therefore it had met with an earthly spirit, it had also contracted wedlock with the same; so as that, of both spirits, it had made a stony Body. 7. I likewise learned, after what manner the spirit of urine might coagulate another spirit within the urine. 8. That such

an association, is not a certain naked co-mixture of parts ; but an undissolvable wedlock of unity, a certain substantial transmutation, a production of a new Being (by an Agent and a Patient) into a neither Body. This experiment gave me an entrance, for a diligent search into the Disease of the Stone.

Yet, I as yet remained wandering about. For after giving of thanks, I transferr'd my self into a meditation, how many ways a thing might be condensed or coagulated in the Universe. For Ice first presently offered it self unto me ; wherein, the water incrusts it self for fear of cold, and from a primitive action : but is not actively congealed by cold. Even as elsewhere, concerning the Elements. But other Bodies, which are believed to be mixt, as they bewray themselves to be the true Fruits of water, by the same Zeal and Tenour, are they congealed by cold, occasionally. For so, Bones and a Sword, are more easily broken in time of cold Seasons, than in time of heat or Summer. 2. Any kind of Salts (according to their Species and inbred property) while their brine, being not sufficientt dried up, is left in the cold, are separated from their water and become corny. 3. If Salts shall subdue any thing, by gnawing it, they pass over from their native condition, into a neither Body, and are coagulated. For so the *Tartar* of Wine, Sope, Borace, &c. are coagulated. 4. And then, Muscilages being thickned by the wedlock of their seeds, and resolved from their own Body, become Gleys, Gums, Solder, &c. 5. But if a muscilage or slimy juyce carries a co-mixed fat with it, it is coagulated in both respects. So are Aloes, a Chibal, Pitch, Rosin, Gum Ammoniacum, Frankinsence, Myrrh, Mastich, the Gum *Opopanax*, *Sarcocolla*, *Assa*, *Elemi*, &c. 6. Earth converting into a salt or muscilage, if it be dried, is condensed and waxeth hard. 7. A mineral Salt that was bred in the earth, by burning, stonifies into stones,, shells or sheards, and earthen Pots. 8. The which, if they are urged by a stronger degree of heat, they at length vitrifie or become Glafs. 9. The watery *Leffas* or planty juyce of the Earth, by vertue of the seeds, is hardened into Woods, Herbs, &c. 10. So Water, by vertue of a seed is made a rocky stone. 11. A muscilage being joyned to a powder or dust, makes sand-stones : but with dust and lime, it now dissembles divers Marbles. 12. Whatsoever lime dissolved comprehends or encloseth in it self, that thing coagulates with it ; Because there are in Lime, two salts, the one a *lixivial Alkali* salt, and the other, an acide or sharp one ; which two salts, while they demolish each other, are coagulated together. 13. Mettals, *Fire-stones*, *Sulphurs*, &c. do by vertue of their seeds, obtain their own and proper coagulations. 14. Also, most things through an inbred Grew, do voluntarily grow together ; which afterwards by drying, do harden : As Blood, Cheese, the white of an Egg, Varnish, &c. 15. Glafs is an earthen stone, consisting of an *Alkali* salt ; The which, while being fired, it is dissolved, makes the sand, or powder of stone that is not calcinable, nor otherwise capable of powring abroad, to melt by corroding ; and so they are both together, turned into a transparent lump. Therefore, the Lime-stone, or rocky stone, by reason of its sharp salt is unfit for Glafs ; because the lime thereof destroyes the Glassifying *Alkali*, and there is made a certain neutral thick or dark Body.

Lime therefore, against the will of *Galen*, very much differs from ashes. To wit, because this separates the *Lixivium* or lye, from it self ; but the other contains a sharpnesse that is not separable from the whole: Whereby it being at length burnt by too much fire, is Glassified throughout its *Lixivial* part, being unfit, for Building : According to *Geber*. Because all fixed Bodies are at length Glassified with Glassifying things. Cheese also, as it is curdled by a moderate sharpnesse, so it is resolved with an eminent sharpnesse. For the paring of Cheese dissolves with dry *Calx vive* or quick-Lime : but not with the *Alkali* or *Lixivial* salt of Ashes. From all the aforesaid particulars, I have collected, that the coagulation of *Duelech* is singular and irregular. Lime also doth by degrees stonifie in the middle of the waters, as its aforesaid salts do coagulate each other. But the body of Man, as it doth not coagulate a rocky stone, so neither doth it endure a *Calx* or Lime-stone in the Bladder. For indeed that admirable *Coagulum* or Runnet, alwayes stuck before mine eyes, whereby more swiftly than in the twinkling of an Eye, the spirit of urine had condensed the spirit of Wine into a lump. Therefore I discerned that all other Coagulations had nothing common with *Duelech*. Wherefore I determined to examine Spirits. Therefore first I distilled Horse-pisse ; But surely the spirit thereof wanted that Runnet. Wherefore I noted with the highest admiration, the singularity of mans Urine.

Afterwards, I observed that the spirit of *Sulphurs*, or of Salts, being sharp, would with 10 an Alcalized body, be made earthly. For so, with Iron, is made drosse, rust, a cankered rust, Ceruss, &c. And these *Paracelsus* rashly judgeth to be *Tartars*, or the separated

impurities of things over-covered with their own, and that an inward Runnet : when as otherwise, they are nothing else, but the astonishment of two mutual Agents : to wit, when both their strengths are spent.

- 11 Afterwards, I long examined Salts, throughout every of their Analysis or Re-solution : and I discerned, that the spirits of all salts were sharp, except Alcalized ones, and those of essential *Sulphurs* in Vegetables. Whose saltish tartnesses indeed, are fat and sulphurous, neither readily reducible into a salt, unlesse by a tedious inversion or turning in and out of the principles ; which salts, being then, as it were elixirated, do represent the true and highest Crasis or constitutive temperature of the seeds of their composed Bodies. But the spirit of mans urine, is neither sharp, nor Alcalized : but meerly salt, even as also that of Horses. And that, for this cause ; because the Volatile sharp matter of the Chyle of the stomach, is by vertue of another ferment, transchanged into a Volatile salt. Even as elsewhere, concerning the digestions of Animals. I here give thee to observe by the way, that in things transchanged, there is not an immediate regresse or return unto that from whence they were transchanged, no more than from a privation to a habit : For that, in transchanging, the last life of the thing perisheth, because the whole disposition of the middle life of the former Being, is at once taken away, by reason of the extinguishment of its former seed : For therefore things transchanged do keep the essence of a new Being, with a neglect of their former composed Body. Therefore have I found any Remedy whatsoever, unprofitable, which I otherwise had believed to be very likely a dissolver of the Stone, from its former composed Body. Yet that is a truth, that the spirit of Urine, in the fundamental point of its nativity, is salt : and that by reason of that salt, it doth more readily coagulate other Spirits ; than any sour or sharp spirit doth Milk. Nevertheless, the spirit of urine doth not coagulate milk, or the venal Blood : Because the spirit of the venal blood ; yea, and our vital Spirit, is salt, after the manner of Urines. From hence indeed, the spirit of the urine, hath it self after the manner of an excrementitious spirit, cut off from the blood ; and so by reason of a resemblance, it is its Chamber-fellow ; neither do they act on each other. And then also, I observed, that the spirit of Urine, doth not more strongly coagulate those things which were already before coagulated. For Bole, Clay, or the rocky or Chalk-stone, do by degrees degenerate by the spirit of urine, into a nitrous Salt, and are rather dissolved. Since therefore, the spirit of Urine doth not coagulate Bodies already coagulated ; such as are Bole, Clay, &c. As neither Bodies coagulable, such as are Milk and the venal blood : but it coagulates the spirit of Wine, or the like thing which is entertained with it in the urine (for as was shewn above : after the fermenting of urine that urine contains, also a spirit of Wine, or *Aqua vita*) I desired not seriously to enquire, after what manner, the stone is coagulated in us, and in our urine.

- 14 1. First of all, it is an undoubted truth, that *Duelech* is not of a calcinous or limy condition, however *Paracelsus* may be carried on the contrary. 1. Because a calcining degree of heat is wanting in us. 2. And then, because every *Alkali*, is rather that which is destructive to a rocky stone, than a Coagulator thereof. 3. Because a *Calx* or Lime presupposeth a Chalky-stone, and therefore *Duelech* should be calcined before it were a stone. 4. From the composing parts of *Duelech* it shall by and by be made manifest, that it is not possible for Lime to be in it ; yea, nor that *Duelech* himself is calcined, or doth send forth a *Lixivium* or Lye. Likewise, neither is *Duelech* of the nature of a gowty Chalk : because he growes together in the midst of the urine : but that Chalk is coagulated from the *Sunovia*. But the *Sunovia* is a living seedy musilage, which degenerated in the journey of nourishment, and from a transparent and Crytaline matter, hath passed over into a thick, white, and slimy matter (as of Gowty persons elsewhere) from a matter without savour, I say, it is transplanted into a sharp one, though the tartness whereof indeed, it hath attained a thickness or grossness : For then also it is unfit for a total distillation or transpirative dispersing of it self : To wit, whereby the nourishable Liquor is wholly consumed without any remainder : But the *Sunovia* being once infected with a tartness, its watery parts are pufft away ; but the gross remainder waxeth dry by degrees, into the utmost dryth and hardness of a Sand-stone. But *Duelech* attaines to the utmost hardness of it self in one onely instant of time. The Gowty Chalk therefore, differs from *Duelech* in its whole matter and efficient cause. For therefore such a Chalk is hardened out of the water, because indeed by drying. Neither for that cause doth it imitate the hardness of a rocky stone : but onely of a sandy stone. I have spoken these things to that end, that it may be manifested, that *Duelech* differs from any other coagulated Bodies whatsoever, in its different kind of Agent and matter. And seeing notwithstanding:

standing, I as yet knew not the manner or process of the birth of *Duelech*; but I knew in the mean time, that Bodies do nor receive the limitation of their hardning, but by the actions, appointments, and properties of their own seeds.

Lastly, Since I knew, that whatsoever things do act corporally, are altogether sluggish, 16
slow, and idle, as for the coagulation of *Duelech*: therefore I enquired into fermental favours and Odours, as the Authors of many seeds. Therefore I found the favours and actions of Salts, to be indeed famous ones: but not any thing reaching the vertue of the salt of Urine.

And then also, I beheld the more weak or feeble Salts, which might follow the Race of 17
Sulphurs. But *Mercury*, although it alone according to *Paracelsus*, did contain the whole perfection of the thing, yet I found it to be slow and feeble. For as oft as I distinguished Salts and *Sulphurs* from their *Mercuries*, I admired at their sluggishness, and indeed at the dignities of these two Principles. Wherefore, I stuck in Salts, for the searching out of the nativity of *Duelech*. I confess indeed, that *Mercury* being a flowing metall, in its nature and properties, is never sufficiently known. But that body hath deceived *Paracelsus* through a similitude of proportion: he thinking, because his Device had pleased him, because he had endowed the watery matter of things with the name of *Mercury*; that therefore the properties of Quick-silver, and its natures, without a peere, being never to be sufficiently searcht into, did agree as suitable to all Liquors which may be drawn out of Simples. For all the *Philosophers* of former Ages, confess, that nothing in the Universe, is not so much as by far, to be likened to *Argent-Vive*: Yet it hath not been hitherto sufficiently unfolded, that *Argent-Vive* or Quick-silver is a Simple, actually existing body: but not a constitutive part of things: And so, that there hath been nothing but a meer abusive passing over of a Name. For this cause, I as yet perswaded my self, that seeing a non-*Duelech* was made of *Duelech*, that ought to be done by the action of an Agent on a disposed matter. And although I knew these and many the like things: yet I discerned, that I therefore, knew nothing the more. Wherefore I as yet more detested a wording or discursive Philosophy: because it was that, which stayed me before the Threshold of Nature, and together with it self my Conductress, I was shut out of doors. I again returned to my self, and after a homely manner I considered, that *Duelech* was not bred but out of the principles of the Urine: and since I knew the urine to be salt, I again had recourse to the varieties of Salts.

And I stood amazed, that the use of Salt should every where be forbidden, as well by 18
the *Schooles* as by *Physicians*, to those that have the stone. Yet I discerned, that the foundation of that prohibition was unknown amongst them. Especially, because the use of Sea-salt, though much and often, never from real experience, hurt any one that had the stone: But rather, I have exactly noted that many, who by the plentiful use of salt, have cut off the relapse of a new and growing stone from them. For I had seen the Rocks, as also the rocky stones of the Sea to be gnawn or wasted in the Haven. In the mean time it had alwayes a recourse unto my mind with admiration, that the spirit of Urine had at one instant, coagulated the spirit of Wine, together with a separation of its watery part. Therefore I consulted first, to anatomize the salt of urine unto the utmost veines there. 19
of. Wherefore, in the strong smelling or stinking body of my urine, after its putrefaction under dung, I began that dissection: and presently by distilling it, I found in it, besides the aforesaid spirit of urine, two the more fixed salts also, and no more: However *Turnheisser* doth variously trifle at pleasure, of as many species of Salts found 20
by him in Urine, as there are, almost, of Simples in the Universe: He being willing, that man should not onely be a *Microcosme* or little World: but also, that his urine should rejoyce in the same prerogative. For on this distillatory Vessel, he according to his own boldness, distinguisheth it into 24 parts, and marks it outwardly with his Lines, and divides the body of man into as many soyles. At length, he will have it, that the vapors lifted up from the urine in distilling, ought to strike especially, the Region of the Glass, and in that part, to grow together into drops, whereby, the business of a Disease in man, whose urine it is, is finished. He likewise feigneth as many diversities of vapours to arise out of the urine as there can be diversities of a disease on the whole body: That we may thereby visibly, perfectly learn, not onely the places affected: but the disease matter; for as he thus excuseth his urine Inspections, suspected of the wickedness and vanity of *Magic*; he hath busied himself by his water-divining distillatories, to deceive the World. That is, in sportings, he would seem to be altogether serious: but I have never distilled that I might befooled others, with my self. The unprofitable invention therefore, of *Turnheisser*, is at least of a trifling value: if not also wickedly introduced into Medicine.

- 21 Therefore in the lee of my urine, I distinguished of two salts : one indeed a Sea-ee salt ; being not so long agoe assumed, and as yet remaining safe, and unchanged (as elsewhere I have shewn concerning the boyling of Salt-peter). But the other is of the Urine it self, being bred in our digestion, and from not a salt ; transchanged into one : but it differs from the Sea-ee salt.
- 22 1. If for some days there shall be no use or need of any Sea-ee-salt ; yet the urine failes not of its own salt. 2. The Sea-salt coagulates it self into graines of a point-like sharpnesse : but the salt of urine growes together into Gemmie Dyés and square Cubes. 3. The Sea-salt alwayes shewes forth its antient tast, even when it is digested out of Jakes's with Salt-peter ; but the salt of urine, savours alwayes of urine. 4. The Sea-salt in its cooling, adheres to a wooden Vessel, even as while it is separated from Salt-peter ; But the salt of urine growes together in the bottome of the Liquor.
- 23 Furthermore, the fixed salt of urine distinguisheth it self from the Volatile salt thereof. 1. By fire and flight. For the one flies away, the other remaining. 2. The fixed salt, is separated from the lees, by an extraction, in moisture : but the Volatile salt, is sequestred by fire. For although meats and drinks wax universally alike sower in the stomach : yet the salts sprung from thence, are not alike volatile ; Because that ferment of the stomach is received after the manner of the Receiver ; and so it varies. Even as neither is *Chrysulca* dissolving the whole and homogeneous mettall, therefore made totally alike volatile. And this diversity doth not break forth from essential properties ; but by reason of a participation of the properties of the middle life of things.
- 24 Neither finally, is that ferment of the stomach, a naked sharpness or sowness ; but a vital and specifical Endowment ; whose end indeed is for transchanging of the food into the Chyle of mans digestion. For truly many the more fixed Beings are received with the meats : which notwithstanding, ought to undergoe the like condition with volatile Juices, if they ought the more fully to passe unto the root of Life. In which point especially, the efficacy of Nature shines forth : the which, of a lump, that is altogether similar or alike, frameth bones and the fibers of flesh, &c. In the next place, it reduceth bones in the stomach of a Dog, unto Chyle, that blood may again from thence be made.
- 25 The two aforesaid Salts therefore, are the more fixed. But one is exceeding volatile in urine ; but an *Alkali*, or any thing like to a *Lixivium* or Lye, never appeared unto me from urine. For if but any Lixivial matter shall be received inwardly ; that is presently filled with sharpnesses ; so that it layes aside its Lixivial disposition.
- 26 For I have seen a Country-man, who cured great Wounds, with the drink of a *Lixivium* prepared out of the *Teile-tree* : Yet the urine of those so cured shewed nothing at all of a *Lixivium*. Therefore have I taught elsewhere, that every *Alkali* *lixivial*, is made by a dissolutive expression of the fire ; Neither that it was before in the composed Bodies.
- 27 But if indeed any volatile spirit doth shew forth the property of an *Alkali* ; (such as is the vulnerary matter of any Herbs whatsoever) that indeed is absterfve or cleansing, and a provoker of urine : yet of its own faculty, under the second digestion, it puts on the nature of the salt of urine ; restraineth four corruptions which would otherwise voluntarily afterwards arise in the wounded. Since therefore there is no *Alkali* in the urine, I have held it an errour, to give an *Alkali* to drink for breaking of the Stone ; seeing it cannot reach to the places of the urine. For neither doth the *Ludus* of *Paracelsus* or his Medicine for dissolving of the stone, prepare a *Lixivium* : but a bitter salt of a sharp one.
- 28 Wherefore he calls his *Ludus*, the *Gall of the Earth*. For it is a stinky stone, yet the more tender one ; and the which, almost wholly flies away through a continual fire of two dayes. But with Salt-peter, much more speedily. Moreover, Stones, Gemmes, Sands, Marbles, Flints, &c. through an *Alkali* being joyned unto them, are glassified : but if they are boyled with the more *Alkali*, they are indeed resolved into moisture : and being resolved, they by an easie labour of their acide spirits, are separated from the *Alkali*, in the weight of their former powder of stones. But these never come to the urine ; as neither are they profitable for breaking of the stone. But Rocky or Chalky stones which have an inflamed *Sulphur* in them, are calcined indeed, but are not easily made Glass ; for that the residuing and sharp salt of the *Sulphur*, consumes the Glassifying *Alkali*. Mettals also, by reason of the every way and unconquered simplicity of their *Mercury*, and impossible penetration, either as being unchanged, they delude the work of the fire, or wholly flye away : yet so, as that although they flye away in manner of a smoak : yet that fume may be reduced into the nature of its antient Mettal, Wherefore Mettals never yielded any *Alkali* : and much less, do they reach unto the Innes of the

the urine. But *Fire-Stones*, though they have a burnable *sulphur*, which is a devourer of *Alcalies*: yet their *mercuries* do resist; whereby they the lesse come down unto the Innes of the urine. The blood also, although it hath an admirable salt for healing, as well fugitive as fixed: yet I have observed it not to be profitable in the Disease of the Stone: But moreover, the shells of Snails, of Animals of the Earth, or of shell-fishes of the water, as to that part wherein they carry an acide and Limy-salt, they profit indeed, persons having the stone, that want cleansing; but they contain a resistance in respect of their *Lixivium*, to wit, as they never reach to the urine. The burnt bones of living Creatures, retain no fixed salt in them: but only a residing Earth without saour. It is therefore a part of notable Blockishnesse, for *Ivory* and *Harts-horn* to be calcined for succours against Diseases; because they bid the powder thereof being deprived of its vertues, to be sold: and so also they deceive the Purse and hope of the sick; they passe by the occasion of well-doing, and make themselves ridiculous. But *Quiners* do freely promise for me. For truly their *Prooving-pots* (which they call *Cap-lls*) ought to consist of ashes, deprived of all salt: Wherefore those are the best that are made of the ashes of Bones, and do far excel those that consist of *Ivory*, and *Harts-horn*.

For indeed, in my first yeares, the *Traditions* of the *Schools*, were as so many Oracles in my account: But I being perfectly instructed by the fire, all the Speculations of the *Schools* were blotted out with the fire. They had perswaded me (amongst other things) that the salt of the Sea was hurtfull for those that were diseased with the Stone; as well in regard, that it afforded matter for the salt of urine; as that, it hurried down a muckie phlegme for *Duelech*. The examination of salt by the fire, taught me otherwise. First of all, I preserved a man of sixty yeares old (belonging to my Distillations) sixteen yeares free from the stone of the Kidneys (whereunto otherwise, he had been subject) through a large use of Sea-salt. The which, afterwards, I confirmed in many. For the *Schools*, when they saw, that in the sharp brine of salt being cooled, every salt was coagulated after its own manner; and that, that brine was not made pure without mixture, but by an exhalation of the watery part: they presently thought, that the stone was coagulated from a salt and drying heat: and so they supposed, that indeed neither were salts corned in the said brine, but by the heat of the inbred salt: the which therefore is not able to unfold itself into effect, as long as there is very much water present with it. Therefore when they tasted their own snivel to be salt: and that indeed, with the savour of a Sea-salt, but not with the saltnesse of Urine: and they would connex the efficient cause in the matter; they supposed that in the same snivel, there was a slimy and rough matter joyned to the salt: and that, the salt also, was of it self salt: at length they established by a perpetual Decree, that the stone was generated from a salt phlegme, and therefore also being actually hot: and by consequence, that salt things were hurtfull for those that were troubled with the stone. Yea and that phlegme remaining such, its qualities and proper passions being changed, did passe over into a stone, through heat and a slimy dryth; just even as Glew and folder, their watery part by degrees departing, do induce a thick roughnesse of themselves. Good God, how unfavoury are the *Schools*, and how unfavoury do they bid us to be? as if thou that dost every where bear a care over Mortals, and art provident for salts; hadst invented by thy study, that they might become stony. How great is their sluggishnesse: that they have never attempted to sprinkle one only pugill or small handfull of salt upon the Urinal of those that have the stone, that they might try whether Sea-salt would coagulate the future sands, which otherwise would stick fast to the urinals; Whether I say, there be so great a saltnesse of the urine, that it cannot dissolve any more of salt in it. For the Urine, if it be for the dissolving of salt: now that salt shall not be the cause of Corning. In the next place, they had easily found, that Sea-salt being cast into the urine, doth hinder its coagulation; but not likewise cause it. That Sea-salt, if say, doth resolve the prepared matter of the *Coagulum* or Runnet, and doth not it self receive a curdling. But whatsoever meditates on the destruction of that Runnet, shall of necessity also disturb the coagulation proceeding from thence. For as the *Schools* do deride our *Coagulum*: in things: so likewise I deride their unfavoury Follies; that they think the pebble-stone or flint to grow together, or wax dry in the bottom of the water, through heat. For Fountaines and Rivers do contend for a stony curdling, whose bottome hisserth out heat and the Rules of dryth.

In the next place, for the curdling of Liquors, our flesh, and likewise the blood, milk, and snivel promiseth: For if it were supposed, that phlegme be the matter [whereof] of the stone, and that the recocted brine of salt, shaved off, and with it self dissolved the mucky filths of salted fleshes: and at length by boyling up, rejected them being

- being thickned, into a froth; verily they had known that the use of Salt is in no wise to be avoided or forbidden. But so great a sluggishness of searching, hath beset the *Schools*, that they being content with a little infamous Gain, have neglected all things where they might profit their Neighbour, if not also themselves. For if the stone were dissolved in the urine, although being boyled therein, or that, urine were not for dissolving of salt cast into it: they might indeed (at the sight of that) have wholly banished salt out of the use of men. But the common people deride the *Schools*, and the use of Salt hath grown frequent, in despite of their Rules: So that the Authority of the *Schools* being despised, Food is not onely unpleasant, but also unwholsome, without salt: But if the seasoning of salt smile on the Palate; that is not any otherwise favoured, than as salt resolves the Excrements which burden the stomach with their muckiness. For if salt be put into the mouth of those that are Catechised or instructed in the Principles of Religion, in the first houres of their Nativity, as a resembling token of Wisdom; But the *Schools* have with much endeavour, forbidden all eating of salt; Truly what other thing is to be prefiged from thence, but that the Heathenish *Schools* do not admit of Wisdom; to wit, the resembling Mark whereof they advise to be excluded? And that the Church doth from the Beginning, intend the destruction of Infants? For salt is sequestred out of Jakes's, by the Boylers of *Salt-peter*; such as was once received into the Body together with the meats. Therefore it ought likewise, to remain in *Duelech* it self. But there is not so much as the least of Sea-salt, found to proceed from *Duelech* by Art. And that thing the *Schools* might have learned with no charge, if any earnest desire of learning, and Charity towards their Neighbour had acted them. At leastwise, the Boylers of *Salt-peter* have been more curious or carefull than so many ten thousands of *Physicians*. The reproach therefore re-bounds on themselves, as every one of the vulgar sort, doth now know, how unpolished the Decrees of the *Schools* are: Since they know not in the *Dietary* part of Medicine, to what end they forbid salted things. Nor indeed, had it been to be feared, if not salt it self, but onely
- 31 the spirit thereof should hurt the Diseased with the stone. 1. Because salt is forbidden by the *Schools*; Ages and the *Schools* being hitherto ignorant, whether there be any spirit to be found in salt, or of what condition it might be, 2. That power in acting, is in vain, which is never brought forth into act. For it is sufficiently manifest, that out of Sea-salt received into the Body, there is never any possible drawing forth of its spirit in us. For it is most sharp, neither hath it a Remedy like unto it self, for extinguishing of the burning heats of the urine, even while the stone is present in the Bladder; also, in the Stranguries of old people, it hinders putrefactions, dissolveth mucky filths, and expelleth sands. Therefore salt is profitable for those that have the stone, as well in its body, as in its spirit. For indeed, Fountain-salt, was given by the providence of divine Bounty, for the necessities of mortal men: That where the Continent departs from the Sea, by a long Tract of Land, saltish Springs or Fountaines might supply that defect of the Sea. But the *Schools* are so far from repaying thanks to God for his Benefit; that they accuse God to have given salt, not onely in vain, but also for the destruction of men: It is to be noted in the mean time, that salt flowes down into the Sea from many and plentiful Fountaines; yet that the saltiness of the Sea is not increased thereby; because something of salt ascends by degrees from the Sea, in manner of a vapour: and however it may be converted into its first matter of water, at leastwise in the Clouds it hath some kind of constancy or perseverance in it. From whence, it is no wonder, that Rain-water by itself, is not to be corrupted in any Ages. But in the more hot Zone, that salt doth exhale even out of the Sea, is manifest: for there is none but smells out whether flesh is boyled in a pot, with salt, or without it. But the Sea-salt, seeing it makes for the preservation of the Element, doth difficultly exhale.
- 32 Therefore the *Spanish* Sea well nigh wants a vapoury salt, is stronger, and the more expels putrefaction, and *Duelech*. On the contrary, the Seas of *Lorraine*, abound with a vapoury salt, and it in part, waxeth sower in the stomach. Also, that vapoury spirit of salt (which is sublimed, being as it were the flowre of salt) differs from the distilled spirit of salt; just even as Oyl of Olives doth from Oyl of Bricks. For the spirit of Oyl of Olives which departs in its first moiety, with me doth at length dissolve a silver thred in a Bottle: But Oyl of Olives preserves Iron from rust. And far more powerfully, doth that remainder of Oyl, from whence the aforesaid half or moiety was withdrawn, preserve Weapons from rustiness. Therefore it is to be noted, that there is not a more pure and refined salt, than that which is re-cooked or re-boyled from the brine of Swines-flesh. For truly, in seasoning, or operating on the Swines-flesh its object, it lost its more vapoury spirit

spirit by coagulation. And so the residuing salt being almost fixed and freed from its earthlineſſe, is found to be clear and moſt fit for Sawces. It being alſo caſt into an Hogſ-head of ſowering Ale or Beer, preſerves the ſame, which other ſalt doth not ſo do. Wherefore it drinks up into its ſelf, and tranſchangeth the ſuperfluous ſharp ſpirits in us, which are the Authours of all Corruption, if they ſhall be out of the ſhops of the firſt digeſtion. It being thus re-boyled with *Spaniſh ſalt*, it is almoſt equal in goodneſſe, with that which was at firſt diſſolved in the bright burning-pot: Since therefore Sea-ſalt is not of the compoſition of urine, but is wholly a forreigner unto it, and ſo remains: yea, ſince Sea-ſalt being detained in the urine, keeps its nature unmixed and unchanged, even until the laſt extraction of things, and ſeparation of the Salt-peter; it is certain, that it hath not any buſineſſe with *Duelech*. And therefore, that neither is the leaſt of Sea-ſalt ever found in the compoſition hereof; ſeeing it more deſtroyes the native birth of *Duelech*, than it doth promote it. Therefore Sea-ſalt is forbidden by the *Schools* unto thoſe that have the ſtone without a foundation. Thus much of Salts.

But I had hitherto learned, that *Duelech* was an irregular coagulated matter, bred from the ſalt of Urine, which had not its peere in the whole Univerſe: for that Mans urine is never found, out of man; For therefore it irked me not, many times to diſtill Urine.

Therefore I decreed to putriſie my own urine for full 40 days in a Horſes belly, that by a foregoing ferment of putrefaction, the unlike parts thereof might diſ-unite. Then I diſtilled about a half part thereof: But being called away from the work by reaſon of buſineſſe of my Family, and afterwards being letted through the Feaſts of *Pentecoſt*, I ceaſed from it for fifteen dayes. But the Veſſel receiving it, was exceeding great, clear, Cryſtalline, and precious: the which I had now ſequeſtered from the long ſnout of an Alembick, all that interval of time: when as therefore I returned to the Work; firſt I powred forth that which had been diſtilled, into another Bottle: becauſe I ſaw that the diſtilled Liquor of the Urine had on every ſide touched the receiving Veſſel (otherwiſe eaſily capable of containing three Gallons) it being over-covered with a duſkiſh whitenefſe. I was grieved that a Glaſſ ſo precious, was ſtained about ſo ſordid a matter. And then I was the more angry, when I ſaw that the blemiſh contracted was not to be taken away by any aſhes. For it repented me of my waſtfull, and ſo often repeated curioſity. Therefore I powred that that was diſtilled, out of doores. But preſently I had this prick of ſtoath and unwonted indignation, ſuſpected by me. I admired within my ſelf, that man who before ſpared no paines and Coſts, ſhould now be wroth at the deſtruction of one Veſſel. Therefore I well weighed with my ſelf, that receiving Veſſel, whether its blemiſh were of a forreign tincture, or whether any thing had periſhed from its concave ſuperficies being corroded. At length, I certainly knew, that out of the moſt clear watery diſtillation,, a true duſky *Duelech* was adjoyned to the Veſſel. But then, I being full of admiration, praiſed the Lord, who had undertook the care of me: for thoſe things which I judged I had committed through my own careleſneſſe, I knew had come to paſſ by divine Goodneſſe ſo diſpoſing it. For unto whom he will, he converts all things into good. Indeed, I had already long ſince beheld in my urine, a Coagulator of ſo great a moment, to inhabit. And now at length, I had alſo learned; that that moſt clear Liquor that was ſeparated from the urine, putriſied in the Var, did containe a true *Duelech*, which it had applied to the receiving Veſſel. From whence, firſt of all, it became an undoubted truth unto me, that there did in no wiſe concur a ſlimy matter unto the Compoſition of *Duelech*. That Veſſel therefore, although pretious, and now condemned for its blemiſh, was dear unto me, becauſe it had paid a Reward of Teaching to its Maſter. Therefore I again put it in the place of a Receiver, as thinking, that I ſhould at ſometime ſhave of that *Duelech* by *Aqua Regis*. Therefore I proceeded in diſtilling the reſidue that had remained unto me after the fifteen dayes reſpite. And behold; I being aſtoniſhed through a new favour of divine Bounty, ſaw all the particular drops to diſſolve the adhering duſkiſh *Duelech*, where they ran down, and the Veſſel preſently reſtored to its former brightneſſe. Alſo, that this ſecond Liquor, although it had the odour of the former, yet being poured on *Aqua vite*, did not likewise, coagulate this any longer. And ſo I being led by a divine beck (which others ſuppoſe to be an Event by Chance) found part of that, which with care or anguiſh I had long ſince ſought with many charges, Therefore I praiſed the Lord, that he had given underſtanding to the little one and poor. For if he had not commanded me to be called away from my work; and if thoſe Feaſts had not detained me untill *Duelech* had grown together in the Receiver, and unleſs the Veſſel had been ſo clear and pretious; And moreover, if I had finiſhed the operation with one thred: Surely I had wrought and attempted all things

in vain. The Lord therefore had respect unto the necessities of mortals ; neither despised he the prayers of the dejected in spirit. Wherefore, he gave me knowledge of the divers parts of a healthy Urine : that is, my own. One indeed was after some sort the lighter and more swift, part having *Duelech* hidden under a clear distillatory Liquor, without a dreg, snivel, and sediment ; But in a most clear distillation, and cold of the encompassing Ayr. But the other part, was alike admirable, which in cold also, again dissolved *Duelech* that took its rise in cold, and supt it up into its self. For I seriously admired so opposite faculties in one onely volatile salt of urine : afterwards indeed, I considered, that whose urine had more of the former spirit, he was subject to the stone : and the other was free, whose urine contained more of the other spirit ; and that first conception smiled on me : but that discursive knowledge was vain, and especially unprofitable for the managing of Affaires : For truly, the urine doth not undergoe in us those foregoing marks of putrefaction ; without which notwithstanding, those Beings would sleep for ever. And then, neither was there a mean made manifest from that Speculation, whereby more of that latter spirit should alwayes be made, or by what method a composure of the former spirit might be restrained. And much lesse, after what manner, *Duelech* being now composed, there might be given a relief against him. Notwithstanding, least that Speculation should depart without fruit ; I considered, whether that latter spirit (the Urine being first evacuated) might be granted to be cast into a stony Bladder, by a Syringe. Therefore the knowledge of mortals offers it self to me as barren ; which rejoycing in Speculation alone, withdrawes their hand from the Art of the fire. For urine being duly putrified, yields a spirit a Coagulator, which coagulates *Aqua vita* : And likewise afterwards such a spirit, which being wholly transparent and volatile, contains a *Duelech* [potential] or in possibility, because it brings him forth, and at length such a spirit, which presently supt up *Duelech* (being once bred) into it self : Notwithstanding, the Devil straightway dissuading me, I as doubtful, began to stagger, and considered, that those things were vain, which being found by me, I so greatly esteemed. Especially, seeing the urine putrifies not in us unto that limit or degree, whereby it had afforded these spirits. Therefore I detested my own Curiosities : For although they after some sort suggested a Remedy, yet they left the former ignorance behind them, concerning the causes and manner of making *Duelech*. Wherefore I began to neglect all things lately seen, as if they had not been done, and I left a sleepy drowlinesse to be stir'd up in me ; From whence I was confirmed (the which, I have explained in many particulars in my Preface) that no labour is more tedious or wearisome, and no kind of knowledge (through the dissuasion of the Devil) more to be disregarded, than that, from whence mankind may at sometime receive fruit. Therefore it becomes a *Christian*, to be of a constant mind in a good work.

At length therefore, my distillations being repeated, and that with a more exact delay, I by prayer attained the causes, manner of making, and dissolving of *Duelech*. Good God, I admire thy great Bounty, which hath led the most unmeet of *Physicians* unto the disclosing of so great a thing, which hath been neglected for so many Ages, and by so many great Wits. I therefore return thanks unto thy infinitely Glorious Name ; not because thou hast led me on unto these Secrets before others (for can the Earth boast it self, and say to the other small Vessels [*Vah*] or [*Fie*] as a note of disdain ? because it is brought under the *Potters-wheel*, into a Vessel of a more choyce form ?) But because thou hast done thy will, which alone is good : I therefore ascribe unto thee all the Glory, who hast in this Age, disclosed this knowledge by the basest and little Ones of this World : For that is according to thy accustomed manner ; and that, for the greater Glory of thy Name. For I knew, that the one onely sluggishness of those, who being deceived by the sweetness of the Odour of Gain, have despised to distill a matter so stinking and base, hath hindred both the Antient and Modern *Physicians*. For Wisdom despiseth those, who have refused perfectly to learn the matter [*whereof*] Dispositions, Contents, Properties, Progress, and Significations of the Urine, by the Fire. For
 34 neither have they lesse stumbled in the matter, Content, and Judgements of Urines, than hitherto they have done in the stonifying of the same : wherefore both the diagnostical or discernable Knowledge, and also the judicial fore-knowledge of urines hath remained hidden : even as we have from a Foundation, demonstrated in our *Uronoscopia* or *Inspection of the Urine* : the which, I heartily wish, that the more fervent Judgements would hereafter practise. For truly, I prepare my self for my Grave, under hope, that my Labours will not be unprofitable for humane miseries.

I will now proceed to reckon up my blockishnesses, and the wearinesses of experiences. For first of all, from *Duelech* being dissected, and distilled all alone by himself: and also from the shavings of the Urinal: Thirdly also, from the urine being distilled unto the thicknesse of an *Ecligma* or *Lohoch*, altogether the same Oyl, and the same Crystals of liquid dung do arise: For from *Duelech* there is left an earthy Lee, being black, brickle, and burnt, no longer rocky, and scarce reserving any thing of the more fixed salt of urine: Because the volatile Spirit is wholly throughout its whole, changed into *Duelech*, and at length into an earth, with other parts of the composition being adjoynd unto it. Verily, for a sure signe, that the fixed salt of Urine hath not the faculty of an active *Runnet*: but is onely coagulated passively.

Furthermore, That earth that was left of the distilled *Duelech*, never lately descended unto the Bladder in the shew of a Pouder or Clay: but it was a Liquor while it was in the urine, which there afterwards thus hardened by the spirit of the urine. For I long meditated, that an Earth or Pouder, however most Artificially it should be connexed to the spirit of Urine; yet it would never grow together into *Duelech*; and by consequence, that the invention of *Tartar* for *Duelech* was also vaine: For truly, I had already beheld in the Glass, that *Duelech* was made of the same spirits (to wit, distilled and clear Liquors) matter, and efficient cause whereof it ariseth in us. Therefore I concluded from my proofes now mechanically made; That if the urine, together with its spirit of salt, hath in it the spirit of a volatile Earth, *Duelech* shall of necessity be generated from those two, unlesse by the Dross (which in the *Book of Fevers*, I call the liquid Dung) the salt of the urine be filled or glutted; and for that cause, be disturbed from coagulating: For I have often observed, that any one that had the stone, being afterwards afflicted with the Jaundice, hath been free from the stone as long as the Jaundice bare sway.

And so, Neither hath it been undeservedly asserted by me in the *Treatise of Fevers*; that the aforesaid Dross being a stranger to Urines, is mixed with them, as it were a profitable Excrement. But the Sands are corned or grainified as well in us, as in Urinals, at the very moment of Corning, and being once Corned, they also obtain the ultimate hardnesse of themselves: but not that they are more and more hardened by degrees.

Therefore it is fabulous, whatsoever the *Schoolers* do devise concerning the stone, being confirmed, and not yet confirmed, for the excuses of their confirmed ignorance and sloath. For the sand that is newly voided from us, or wiped off from Urinals, is as hard as it will be for ten yeares after. Let the same Judgement be also of *Duelech*. I have also, said above, that unlesse the sand which is affixed to the Urinal or Chamberpot, were coagulated in an instant, it had wholly fallen headlong to the bottome, neither would it be fastened to the sides, and so proportionably distinct.

An heretical Preacher nigh *Barclay*, in *England*, being safe and sound in health, in the Year 1629. striving after Dinner to draw a Book unto him from a high place was sorely smitten with a great weight and pain in the bottome of his belly; and four dayes after he by certaine signes knew that he was burthened with the stone. And eight dayes after that, he dyed at *London* under the Knife of the Stone-Cutter. But that stone weighed an English pound, and two drammes beside: Neither do I remember, that ever I saw the like stone: But an hundred pounds at *Antwerp* weigh at *London* 104.

But *Paracelsus* admiring this appearance of the stone, least a fiction should be wanting to his *Microcosm*, calls it the stone of Thunder, and thinks that it grew together in falling: But that errour of his is manifold. 1. For there is no place granted for its falling. For truly, the Bladder containes urine, or no urine: if no urine, it is folded together like a wet Towel: But if it be extended by urine, seeing this is beneath, *Duelech* cannot be formed out of the urine, or without urine, that it should be made without matter, and fall downwards into the urine, that it may be made in falling. 2. He erres, believing that the stone which is cast down in Thunder, is generated by ordinary and wonted Causes: but not by monstrous ones. Otherwise, if the matter that is natural to Thunder, should be naturally coagulated in an instant, such stones ought to be accustomed to all particular Thunders. Neither

Rrrr

should

should there be a Cause, why a small stone of about three pound weight, should pierce into the earth unto the depth of nine foot, by its onely and naked fall : unless it were thrust down with a stronger force, even as concerning an irregular Meteor elsewhere.

3. In the next place, *Duelech* bewraying it self by a sudden Tyrannie, proves that its generation is in a moment; For nothing hinders, but that he adhered to the Bladder with his foot, and that being broken off through the steepnesse of his passage; he fell down into the widenesse of the Bladder. 4. Whatsoever is at any time condensed into a true *Duelech*, whether it be a Central Kernel descending from the Kidney; or in the next place, growing in manner of a Bark; every Generation thereof, is al-
 42 wayes made in an instant. For indeed, I have learned by my Mechanical Operations, that *Duelech*, and what quantity there is in him, is wholly constituted of meer volatile Beings : yet, not that of a urine of three or four ounces (of which quantity that of him that made water might be) a *Duelech* of one pound could be generated.

Moreover, although I knew mans urine to be onely in our species : and that the spirit of mans urine alone was in the possession of man; Yet I examined Horse-pisse, in the name of the bigger Cattel; as being carefull, whether perhaps, there might not be another like coagulating spirit, which by reason of Impediments co-bred with it, could not every where obtain the command of coagulating. But however I laboured, I found not that spirit the Coagulator in Horse-pisse; As neither the spirit of a ferment, or of *Aqua vite*.

43 Therefore I found a potential *Aqua vite* intimate with mans urine, and that a pliable one, between that spirit the Coagulator, and the putrified spirit the Receiver of the aforesaid Runnet or Coagulum. And it is chiefly to be noted, that the spirit of urine doth not coagulate, but by the Wedlock of *Aqua vite*: the which I have often approved by distilling. There are therefore, three things in the urine of man, which must of necessity concur : and by so much the more powerfully, by how much every person troubled with the stone, doth now bear no light or small principle of corruption in his urine (as presently in its place) from whence indeed, a ferment is swiftly stirred up in the urine for the aforesaid *Aqua vite* that is capable of Coagulation. For neither doth it withstand these things, that as well the spirit of Life, as the *Aqua vite* it self, are exceeding swift of flight, and so, scarce fit for the stubbornnesse of *Duelech* : for it is certain, that the spirit of *Vitriol*, doth most swiftly flye from its volatile Companion, yea and that it is presently fixed by the swift *Sal Armoniack* : So that it undergoes a fusion or liquidnesse of substance : whereby our followers being perfectly instructed, do presently cease to wonder; which things, otherwise, affect the ignorant with amazement.

CHAP. IV.

A proceſſe of *Duelech*.

1. The manner of making *Duelech*. 2. It is a ſingular Being, nor having its like. 3. A mechanick or handicraft Operation of the Fountaines of the Spaw. 4. Oker in the Fountaines of the Spaw, might have ſcared Paracellus from his device of Tartar. 5. A diſſection in the actions of Spirits. 6. The Fire-water, that hath not an homogeneal Being like unto its ſelf. 7. The difference of the aforeſaid diſſolving liquor with all others of the whole Univerſe. 8. Some Oyl of Gold is of a Pomegranate or light-red colour. 10. What the generation of *Duelech* may beſpeak. 11. The action of Bodyes on Bodyes, of what ſort it is. 12. The Doctrine concerning the action of Bodyes and Spirits. 13. The participations of faculties out of mettals without a metallick matter. 14. The deluſion of the Alchymiſt. 15. Diſeaſes are appointed for a puniſhment and Reward. 16. Some exerciſes, beginning from ſalts. 17. The ſpirit of ſalt is made earthly. 18. A trivial Queſtion. 19. The device of froſty Tartar. 20. From whence the Strangury of old people is. 21. Four remarkable things iſſuing from thence. 22. A ſecond Queſtion. 23. A third. 24. A fourth. 25. Catarrhs or deſluxions of the Bladder, are ridiculous. 26. A fifth Queſtion. 27. A ſixth. 28. Astrologers are taken notice of. 29. Paracellus is noted, like as alſo Galen. 30. The ſolving of a queſtion propoſed. 31. The heedleſſneſſe or raſhneſſe of Galen.

The ſpirit of the Urine laying hold of the volatile earth that was procreated by a ſeed, 1
and a hoary and putrifying ferment, ſtirſ up the ſpirit of Wine, the inhabitant of
the Urine, as yet laying hid in [*Potentia*] or poſſibility: by the which, as it were, by two
Sexes concurring, the certain aforeſaid earthly ſpirit, drinks in the one onely afore-
ſaid Coagulator; by reaſon of which reciprocation or mutual return, a moſt thorow
connexion of them both ariſeth in acting: becauſe they conjoyn in manner of ſpirits,
throughout their very leaſt parts: And ſo the Coagulator doth at one inſtant, coagu- 2
late the ſpirit of Wine, that was potentially ſtirred up in the putrifying ferment, where-
unto, when the hoary or fermental putrified Maſſe hath applyed its matter, they are
condenſed or co-thickned together into a true *Duelech*; ſurely, a Monſter, this new ſome-
thing coagulated in the middle of the urine; Nor therefore capable of being again re-
ſolved into water. For it is a rocky Animal Being, like unto no other, and the which
therefore, Paracellus names *Duelech*: And that Being, will the more eaſily enter into 3
the mind, by a daily example which the Fountaines of the Spaw preſent unto us. For
they have a ſulphureous ſpirit, manifeſtly tart (from whence they are called the *Sharp*
Fountaines) and alſo a vein of Iron. For both being of an imperfect and immature ſhape,
are contained as diſſolved, in the ſimple water. Therefore they both begin mutually to
joyn their reciprocal forces againſt each other: And at length, when as their ſtrength
being tyred, they have deſiſted from their action, they are condenſed into a ſtony body,
which affixeth it ſelf to bottles in the form of *Oker*: and ſo the water returns into its
ancient Element, as uncloathed of every ſtrange quality. Which *Sharpiſh* Fountaines, 4
if Paracellus had ſufficiently contemplated of, or he had neglected the hiſtory of the
Tartar of Wine, borrowed from *Baſilins Valentine*; for he had known that there is not
the like birth of *Oker* and of Tartar of Wine. At leaſtwiſe, he might have been with
the more difficulty convinced: Becauſe Tartar is reſolved into water; but *Oker* is not,
as neither is the ſtone: For neither have I ever attempted to deny, that ſolid bodyes
are conſtituted of Liquors: But I reſuſe tartarous liquors, they being forcibly brought
into the Cauſes of Diſeaſes (as in the Treatiſe concerning Tartars) but on the contra-

- ly, I have reverently admired the activities of spirits on spirits. Truly, since *Oker* grows out of the waters of the *Spaw*; or since a stony crust is spread over bottles throughout their whole hollownesse; let it first of all be wickednesse to give the water of the *Spaw* to drink; if we believe that *Tartars* are made just as *Oker* is in the *Spaw-water*: That is, if we believe, that there is *Tartar* in the water of the *Spaw*, which is presently to be coagulated in the Drinker, he commits wickednesse, who gives the *Spaw-water* to drink.
- 5 For while the acide or tart salt of Wine corroded the Lee: that salt indeed, which before was tart and not coagulated, remains tart, and is coagulated; Neither doth it change the essence of Salt, although that salt which before was fluide, be constrained or bound fast together. In like manner also, although the Lee hath supt up the acide spirits, and coagulated them into it self: yet a solid body remaineth, while the spirit of the acide salt is coagulated into the solid body of *Tartar* of Wine: Yea, before that it be fully coagulated, it affixeth it self to the Vessel. For in the Generation of *Tartar* of Wine, the spirit acteth on a body; and there is altogether a far different action, while two spirits act on each other: For in this action (even as in the water of the *Spaw*, in *Duelech*, &c.) a new and neutral Being is constituted, such as is *Oker*, of the spirit of *Sulphur*, and the volatile vein of *Iron*: But in the *Tartar* of Wine, onely the tart spirit, or sour liquor of the Wine, is changed into a Salt, and the Lee remaineth such as it was before: And therefore the matter constituted thereby, is again dissolvable. For a metal, stone or solid Body is not unbodied, changed or volatilized, by reason of the corroding of spirits: That is manifest: For Silver, Pearls, Corals, Spungy-stones, Crab-stones, Snails-stones, &c. although, by *Aqua fortis*, (and other sharp Liquors, they vanish out of our sight; yet they are stones, as before even as concerning Fevers) indeed the spirit did what it could: but it operated as it were in vain upon the body, while in corroding that body, it coagulated it self.
- 6 For indeed, there is in the whole nature of the Universe, one onely fire, the burning *Vulcan*; So also, there is none but one onely Liquor, which dissolveth all solid bodies into their first matter, without any changing or diminishment of their faculties: which thing, *Adeptists* have known, and will testifie: but in all other faculties of Liquors, a body can
- 7 never radically co-mingle it self with the solving Liquor: And therefore it is corroded indeed, but is not intimately solved or loosened, even as otherwise is required for a formal transmutation: For every sharp gnawing spirit, in gnawing of another body, is coagulated, and well nigh fixed, and passeth over into the form of a thickned salt: yet the body that hath suffered the wil of the gnawing spirit to be done upon it, doth not act any thing on that spirit; which in gnawing & by its own proper action coagulated it self: the which indeed comes to passe, while two active spirits run together on each other: For then there is a double action, whereby both of them do mutually act on both. For therefore, such an action of theirs, is made with a thorow radical mixture, and there is constituted of them both, an of-spring of unseparable mixture; and this transchanged body, is a neutral product from them both. But if *Paracelsus* had timely or fitly contemplated, instead of his *Tartar* of Wine he had taken the *Oker* of the water of the *Spaw*, and had spoken something more probable, than that there were Liquors in all things, which were coagulated after the manner of *Tartar* in Wine; and that they were the common mother and matter of any Diseases whatsoever. *Oker* indeed, the daughter of the *Spaw*, is not again resolved, like as *Tartar* of Wine is: and yet it differs from *Duelech*, as much as a Mineral stonifying, doth from the stone in man. For in this, the Spirit the Coagulator existing in the urine, operates by vertue of its own and of a different salt, upon a hoary and putrifying spirit of earth, without the boyling up, or belching forth of a wild *Gas*: and so, it finisheth its operation, and coagulates it self with the spirit of Wine that is proper to the urine, in a moment, even as I have above declared in the handicraft Operation of the spirit of urine, and Wine, or of a burning water. But the acide spirit of the water of the *Spaw*, having sprung up from an Embryonated or non-shaped *Sulphur*, do operate, first in a long Tract, do stir up bubbles, and a wild *Gas*, and at length affix themselves to the Vessel. For otherwise, if that *Gas* cannot be belched forth, the waters of the *Spaw* remain safe, being fit for healing. For if the *Gas* be hindered from going forth, it hinders, whereby the subsequent effect cannot follow, and the spirits are rendred feeble and barren in acting. But the lee of Wine, seeing it hath its own coagulation, and that which is proper to it self, it hath no need to attain it from elsewhere: But since the sharpest spirit of Wine hath gnawn the lee, there is no reason that it should give that in gnawing, which it self hath not in it self. Therefore in the generation of the *Tartar* of Wine, that sharpest, saltish spirit, shall be coagulated indeed, by reason of the earth or dreg: but

but it shall remain in the shape of a dissolvable salt, and not in the form of a rocky stone; 8
By reason of that Rule; that a transmutation of the essence presupposeth a transmutation
of the matter. Therefore the earthy body, whether it be dissolved by a Corrosive,
or not, keeps its own antient Being: Because, that Dissolver doth not pierce the matter
dissolved, in the radical bond of connexion: The which notwithstanding, in things that
are essentially to be transchanged, is exceeding necessary to be done. Therefore let the
young beginners in Chymistry learn, that bodies are not resolved by the calcinations of
Corrosives, although they are also, often repeated; unlesse a fermental impression
through putrefaction, which goes before every radical dissolution, doth interpose. *Camphor*
indeed, in *Aqua fortis*, assumeth the nature of a swimming Oyl: but that Corrosive being
washed away by common water, the *Camphor* is presently what it was before, whether
that be once done, or lastly, a thousand times.

For in my young beginnings, I rejoiced, that by a Retort, at the seventh Repetition, 9
I had dispatched Gold into the shape of a Pomegranate-coloured Oyle; As being mind-
full, that he who knew how to destroy Gold, hath known likewise how to make or build it
up. But the Corrosive its Companion being taken away, the Gold returned into its self,
and my vain joy ceased: He labouring in vain to extract that which is not in it. They also
labour in vain, who do not operate by due means.

The generation of *Duelech* therefore, is not the imaginary stonifying of a cocted mus- 10
cilage, or of a feigned phlegme, dried by the heat of the place, or confirmed, or har-
dened by drying (for so a Bole or clod onely should be resolvable, but not *Duelech*) but there
is a passing over of three spirits at once, into *Duelech*, by a true & essential transmutation.

Truly, Bodies do not act on Bodies by a natural action of Composition; but whatsoe- 11
ver Bodies do perform on each other, that is done by reason of weight, greatnesse or
magnitude, hardnesse, figures, and motions: And truly, those are serviceable for Science 12
Mathematical, but scarce for Science Natural. But if corporeal salts do operate, it comes
to pass either because they after some sort, contain a volatile spirit, or do find that spi-
rit in a Body. Let young Beginners at least, remembe, that Bodies, after whatsoever
manner they shall be once intermingled by co-melting, do notwithstanding, remain in
their antient essence, unlesse they are transchanged by the fire, or a ferment.

Lastly, that Bodies do operate nothing on Spirits, but do onely limit these by suffering:
Which operation of Bodies therefore, is not a true re-acting: but rather a meer effect
of spirits, resulting from the proper activity of the same. For therefore, Spirits, when
their faculties are worn out and exhausted, do voluntarily decay in the end of their mo-
tion. And although that action of spirits be made with the suffering and losse of their
own powers; yet they do not therefore, transchange Bodies into their own nature; For
they onely gnaw them, and grind them into powder: the which also, they interpret to be
a calcining by water.

By way of example, joyn thou a pound of *Crocus martis*, to a sixfold quantity of Oyl 13
of *Vitriol*, then distill thou whatsoever shall be watery: Thou shalt find the *Vitriol* of
Iron or *Mars*: Take from thence the Iron, and thou hast the *Vitriol* of Iron. A Salt I
say, like *Vitriol*, whose tast is of Iron; Yet retaining nothing of the *Mars* or Iron. For
thou hast a limitation from the *Mars*, as to its efficacy, but not in respect of its matter: And
the former spirit of *Vitriol*, or Oyl of the *vitriol* of *Copper*, shall be fixed into a certain
salt, onely by the odour of the Iron. Again, Take the same and more clear example.
Conjoyn thou a pound of running *Mercury* or *Quick-silver* unto a four-fold quantity of
Oyl of *Vitriol*; Take away its flegme by distilling, and a white precipitate shall remain in
the bottom like snow: Likewise, If thou shalt pour on it more Oyl than is meet, the
Mercury will unsensibly surmount, together with the Oyl. Furthermore, If by a Liver,
thou shalt take away the tartnesse from the aforesaid snow, there will be a powder of a
Citron colour in the bottom; which being revived or unto Life recovered, shall be of e-
qual weight with the former *Mercury*: But the water, which in washing off the salt, drinks
it up into it self, affords a true Alum. For so one onely pound of *Quick-silver*, onely by
its touch, should be able by degrees to change many thousands of pounds of the sharpest
Oyl of *Vitriol* into an Alum, without any losse of its substance: which same Oyl, by the
touch of the Iron, is in like manner changed into the vitriolated salt of *Mars*, being a
noble Medicine for healing. Let the action of the *Mercury* without an essential re suffer- 14
ing of its substance, be taken notice of: And it is a Contemplation of great moment. For
truly, a great rout of *Alchymists*, are deluded by their own hope, thinking that fixed Bo-
dies being solved in Corrosives, gave unto these Corrosives their properties; at least-
wise, if those dissolving Corrosives, have from a voluntary motion of activity, coagu-
lated

lated in their possession. They know not, I say, that Spirits being wearied by acting, do degenerate into a new Being. To wit, while they descend unto the limit of their power in acting. And then, we must know, that every operation, which tendeth unto a transmutation of both (namely, the *Agent* and *Patient*) consisteth only between meer Spirits: But that the operation of a Body with a spirit of things without Life, begins from the spiritual odour of a certain putrefaction by continuance; because seeds and fermental dispositions depend thereupon, and according to their own will or arbitration, do command Liquors appointed for Generation. Wherefore the *Antients* have not unfittly advertised us; *That the rise and continuation of the visible world, is from an invisible and incorporeal Essence (such as are Odours and Ferments.)* And in our own borders, *Duelech* growes together from an incredible Spirit, the Coagulator, and from an invisible Beginning. For neither hath it stood in need for its nativity, of *Tartar* brought from without, of the Son of a more inward muckinesse, or of the feigned curdlings of drying. It is a far more calamitous thing, that we carry the very *vulcan* of the Stone about us, in our urine, unto the importunate command whereof, the properties of a volatile spirit do hearken.

15 For God had seemed to have loved Bruits before us, if he had not directed Diseases unto a Reward, and so unto good, whereof a temporal punishment is not worthy. But besides, where a fore-seen end of punishment is present; he hath from the Gift of his Bounty erected the powers of Medicines. In Beasts also, stones are bred, but not given for a punishment, nor for a Reward, which grow in them for Medicines to us. And therefore, they also arise from a far different Root.

16 Moreover, before that I proceed unto the History of the Stone, I will premise some exercises. First therefore, In the Salt-pits of *Burgundy*, there are at this day, no more than two pits, the pit of *Brine*, and the pit of *Gray*. But if indeed, an hundred measures of both pits are boyled apart, they yield far lesse salt, than if they are boyled in the same quantity, being conjoynd. The Inhabitants admire at the Experiment, and therefore they henceforward confound both Brines together. For indeed, the one of them, containes more of a vapory or volatile salt, which being boyled apart by it self, with a flaming fire, flies away before its coagulation. Notwithstanding, meeting with another more fixed salt, it is imbibed and contrained into a solid salt. The example teacheth this, That Bodyes of Salts do drink up their own Spirits, and that their spirits in like manner, do gnaw their Bodyes: For truly, the Brine of *Burgundy* being clearer than Crystal, doth notwithstanding, through its vapory salt spirit, drink up into it self, a great part of a rocky stone; which therefore, in time of boyling, To wit, while the spirits are coagulated in the more solid body of the salt, settles, and is scummed off with difficulty. Therefore, that spirit of salt, although it dissolved the stone, yet it therefore contracted not wedlock with the earth; as that, either this should stonifie, or the other be made salt. Yea, it even from thence is manifest, that although the Sea-salt had vapory or volatile parts; yet it could not come unto the stone, as neither to the spirit of urine for an increase: Because it is that which consists of far different principles: (even as elsewhere concerning Digestions) but the Sea-salt, by how much it is a stranger with the Urine, by so much it shall stir up consultations of dissolving *Duelech*. For whatsoever dissolveth the stone of a Rock, and doth hide it invisibly in it self; that at least, shall not perswade the original of the stone. Thus far concerning a fixed Earth, dissolved by the spirit of salt, and of the vapory and coagulated spirit of Salt.

17 Now concerning a volatile salt decaying into a solid body. Sublime thou *Stribium* with an equal part of *Sal Armoniack*, by a gentle or indifferent fire; thou shalt see the salt to arise tinged with divers colours: Separate the colour from the salt, by water, and thou shalt have a powder, which with *Salt-peter*, flies away almost wholly into a flame. But if that which is left with the *Sal Armoniac*, be as yet twice sublimed by it self, and freed from its salt: thou shalt have a powder of *Stribium*, voyd of salt; wherewith, if thou shalt then mix *Salt-peter*, it shall be no longer inflamed: but as much *Salt-peter* as thou shalt mix with it, is changed into an earth, and neglects the nature of a salt: For the odour of the *Sulphur* pierceth the *Salt-peter*. So the odour of the salt of urine, and its volatile spirit, presently changes the earthly spirit in the urine, that was stirred up by a certain kind of putrefaction, into the stone. And therefore, the urine is not corned or grainified presently after making water: but after it hath assumed the beginnings of putrefaction. Hitherto tends that question: *Why children and old men, are more stony, than themselves being men of a ripe or middle age?* Is it because they are hotter? What if the *Schooles* do in this place, without blushing accuse the coldnesse of Children and old men, as having forgotten shame; because according to their will, the affect of the stone doth coagulate

coagulate or grow together through heat alone : what shall it help to have invoked a more plentiful quantity of phlegme, if heat the one onely efficient cause, be wanting? If I say, phlegme (which as such, doth stonifie) be wanting in Nature? Neither can they devise the same Temperature or Complexion to be in Children and old Men, without the disgrace and confusion of their own received Opinions : As neither shall they find a likenesse in the urine of them both. For the urines of those of an untipe age, are grosser ; but those of old people, watery and washy : the urines also of such as have the stone, are watery. I have in time past, seen old men molested with a continual strangury or pissing by drops, even until Death, unto whom Diuretical (that is urine provoking) Remedies of *Saffron, Mace, &c.* And likewise *Lenitives* or slippery Astwagers of the Mallow, Marsh-mallow, &c. were vain and of no effect ; and the which, *Physicians* had now pronounced to be besieged with the stone : But Cutting testified that they were free from the stone ; (*Michael Des Montaignes* saith, that the Bishop of Paris his Uncle, was cut in vain) and so they also learned, nor to divine of the presence of the stone, from the urine. For these very stranguries, *Paracelsus* devised his own frosty fiction of *Tartar*, which hath not as yet been found in dissected persons. Indeed afterwards I knew, that as oft as the Gawl was more weak than was meet (as in old people) it could not change the four Chyle of the Stomach into a salt Salt : Wherefore, that from a very small and daily quantity of sharpnesse being left, the strangury of old folks, although the stone be not granted to be present, doth continue.

So new Ales do stir up the strangury in many, by reason of the residing and inherent tartness of a more new Ferment. By this Title, namely, through defect of a Gawly ferment, the urines of aged people and Children are the lesse tinged. From whence these remarkable things do follow.

1. That the affect of the stone doth the more easily grow together, through a scarcity of the dross or liquid dung in urine. 2. That it is a Remedy from the Cause, to have comforted the ferment of the Gawl. 3. That urines do seem the sharper in the strangury and pissings by drops, as they contain something of a sharp matter in them. 4. There clearly appears to be a profitable use of the Dross, and of the connexion thereof in the urine. And then it is asked, *why the Stone in the Reines is frequent, but that of the Bladder, more rare?* I have answered elsewhere : That as long as the urine is in the Veines, it is not yet perfect : For neither doth it as yet cast the smell of urine, or hath it the properties of urine ; as neither is it convenient for the venal Blood to be seasoned with the odour of an Excrement. The limitation therefore of the urine, is from the Kidney ; but the odour thereof belongs to a putrefactive Ferment ; because to an excrement : and therefore it volatilizeth the earth of the urine. But moreover, although the Fermental putrefaction of the urine may render the earth of a strong and putrifying smell ; yet it stayes not in man as long as it putrifies. Therefore the hoary or rank earth hereof, hath need of the spirit of the urine, that it may become stony. For in the Kidney (where a fermental putrefaction of the urine ariseth) a new and volatile earth doth easily associate it self with the spirit of the urine, and is corned, especially while as the Dross, the preservative from the stone, hath not as yet come thither : But it becomes a *Citron* or light-red colour, even no lesse from the place, than from the aforesaid Dross. The Kidney therefore payes the punishment of those things whereof it is the first or chief Author. I will elsewhere teach concerning the Womb of *Duelech*, that there goes before the Kidney, a disposition unto *Duelech* : which disposition, because it is vital, and not a meer excrementitious one, even as in the Bladder ; it is also, more plentifully coagulated in the Kidney, than in the Bladder. For this, because it is a meer sink, is wholly destitute of every Ferment : But the Bowels, as they are the stomach of the Gawl (even as elsewhere concerning Digestions) are a vital and cocting Receptacle : But the Bladder is a meer Retainer of the excrement alone.

It is asked, in the next place : *Why the Stone of the Kidneys is for the most part, yellow, and that of the Bladder somewhat whitish?* Truly, the Kidney hath a Ferment for the making of an excrement ; and therefore it hath need of a liquid and tinged dross. And then also, the Kidney hath venal blood as a neighbour unto it, and a tinged substance of its own ; But the Bladder couples of the Glew of its own immediate nourishment, unto the hoary earth, and to the Spirit the Coagulator, in the body of the Urine. Consequently, from hence, it is manifest, why *Duelech* that is bred in the Bladder, is the harder. It is, because a great part of the nourishment of the Bladder, departs into a mucky snivel, which together with the rocky Beginnings of Coagulation, the more hardly and toughly prepares *Duelech* ; Even as Lime with Meal, renders the mortar far more tough.

The

The Reines also, being by *Duelech* their Companion, at length hurt even unto their solid fibers: do afterwards cast forth white, and sufficiently hard stones: I have taught elsewhere, that the nourishment of the Bladder, by reason of the stone, or some other importunity, is, before its full digestion, separated from its solid part, and is wept from it like a mucky tear, and co-mixed with the urines: That there is, I say, an excrement of the last digestion, which goes astray and is letted in the Bladder; being sometimes indeed, an occasioned effect of the stone, but not the Cause [*per se*] or [*by it self*] thereof, although it now and then be occasionally and by accident, assumed.

25 For some *Physicians* admiring at so great and so continued a plenty of pissed snivel; and knowing that it was not purulent or proceeding from corrupt matter, seeing they knew not from what an Ulcer so great a plenty of *pus* or snotty matter could drop; at length, they being as it were constrained by a sufficient enumeration of Causes; surely through miserable stupidities, they brought Catarrhs or Rheumes (so ridiculous a thing!) into the Bladder. But others, while they durst not implore vain Accusations on the healthy Brain, and are in great doubt about corrupt matter, they denounce the Ulcers of the Reines, to be the Fountaines of so great a Glut. So that without a foregoing Aposteme, that mucky snivel doth oft-times divide the half part with the urine, in the Urinal, yet thy suppose, that from the Kidney being without pain, so much snotty *pus* doth daily showre down. First of all, I have taken notice, that many have been cured at the *Spaw*, whom the shamefull debates of *Physicians* about the purulent Ulcer, Consumption of the Kidneys, and Catarrhs, had banished thither to dye: Who, when as they had beyond the hope of those *Physicians* returned sound, they boasted that those sick were cured by them, from the profitable Councell of Travelling thither.

26 But why hath my urine that was healthy, applyed a sand unto the Urinal in the cold: but not, being detained so long within, in heat? I have said, *That urine was from an inbred Balsame, alike easily preserved, both from stonifying, and from putrifying. And then, that the Urinal was a vessel fit for affixing of that sand: but not the Bladder. And lastly, that the earth is volatilized by putrefaction.*

27 It is also a doubt, why of Twins that are nourished by the same milk, the one of them onely is sometimes diseased with the stone? In which doubt, the *Schools*, Women, Idiots, and rustical persons, think that by one alike Answer they have sufficiently satisfied themselves: if they have named the cause thereof, an evil distemper or inclination of indispotion, and have alleadged humours.

28 Which inclination, *Astrologers*, although they distinguish not in the Conception, or Quickning; yet they put a difference betwixt it, in the birth: and in this respect, they confound Twins, into divers Conditions. But at leastwise, the Etymologie of an [*inclination unto the stone*] doth even in the entrance, render *Paracelsus* suspected concerning his *Tartar*. Yea, and thus far *Galen's* own *Schools* have have forsaken him without light: Who being contented with an unequal distemperature in Seminal (although Homogeneous) Constituters, yet so it were now turned into nature, he thinks that he hath abundantly satisfied the question: and he prosecutes it with desperation, that for this Cause, that unequal distemperature, is unseparable from him that is born. He takes away indeed, the common name of *Inclination*, but the former if not more gross Darkneses remain: While as he resolves a Controversie by a Controversie, and with desperation cuts off the endeavour of enquiring.

30 It is certain in the mean time, that the duplicity of the question is not to be drawn but from a disorder of the matter: The which, seeing it is not found under so simple an Homogeneity of the seed: it must of necessity be limited in the *Magnum Oportet* or necessary remainder of the middle Life of the place or Climate of the Womb. For the sides of Women do so differ, that we are every one of us, as it were a pair of men distinguished side-ways: and our other inward Bowels do border side-ways upon the Womb. For from the first Constituting parts, there are indeed hereditary defilements drawn, which are equally distempered on the whole Conception, if they were derived from the Parent the Begetter: but those blemishes which are found in the place, are adjacent unto those places, and invade us as more immediate unto us. A Wonder it is! to consider, How easily our most tender Beginnings do hearken unto foreign impressions; and how easily things once received, do wax ripe; and finally; how stubbornly they persevere: Also those Seminaries of Diseases, which are soon gotten by a proper error of Living; how friendlyly they are entertained in, and do bear sway over the same powers wherein, and over which the hereditaries of Diseases are entertained and bear Rule. And by so

so much the more powerfully they enter, and are the more insolently imprinted or stamped on us, by how much their wedlock doth defile the *Archens* in us, being as yet the more young. For as long as we receive an increase; the seeds of Diseases, although they are drawn in, in manner of an Odour, they are also incorporated in our radical Beginnings: and in some one such Beginning, do the stony perfect acts of seeds wax ripe with us: The which also, even by the Odour being drawn in, the Ferments of the seeds have more largely constituted elsewhere. For from an entire nature, every man ought to be healthy, and of one inclination; but that, by reason of the properties of the middle Life, nourishments, perturbations, and Climates, disorders had crept into the Sons of *Adam*. But those disorders which do privily enter with the Mothers blood, and Nurses milk, do as Household Thieves, possess the Treasures of Life; neither do they easily depart, but under the aydes of Renovation.

But I coming nearer to the Knot, do say, That in the Kidney, there is a dungy ferment, being a putrefactive of the urine; the which wandring, and the mark of its going astray, being once imprinted, the urine doth from thenceforth, proceede by a voluntary flux, and by degrees tendeth unto the utmost putrefaction of it self, under which lurketh a power of making the earth volatile. Since therefore, there is in the Kidney, this power of fermenting: The question, Why one of the Twins hath his Kidneys, the more strong in a dungy Ferment, is resolved, by the Chapter of the unequal strength of the parts: To wit, so as the stomach of one hath an avernesse, and another more strong stomach, not so. For so the Kidney that is the more rich in a putrifying Ferment, is more prone to the framing of the stone. The Begetter also, if in time of generating, he hath his Bladder filled with urine, is wont to raise up an off-spring subject to the calamity of *Duelech*; Because the fermental putrefaction of his urine being the longer detained, doth fermentally increase it self in the neighbouring seed, sliding thorow. *Galen* indeed erres by so much the more ridiculously, as that he will have something of urine, to be naturally in every seed, and to be alwayes added thereto, by reason of the tickling. As being ignorant, To wit, that not so much as a foreign hair is mixed with the Beginnings of Generation, without a total destruction thereof. But how the afore-tasted particulars do serve our intention; take notice, That an unequal strength of the parts, is as it were necessary to the most intimate nature. For neither shalt thou draw a thred of Homogeneal Gold, which may not be sooner broken in one part of it than another. And so, that it is weaker than it self: Disorder, unlikenesse or inequality, and diversity of kind, are onely from the innermost essence of things; although unto their essences, they are altogether Forreigners. For from hence it is, That Twins which sprang from one onely and a single seed cannot escape an Heterogeniety or diversity of kind, especially being that which is by so easie a Contagion, brought into the Beginnings of Things.

CHAP. V.

CHAP. V.

The History of *Duelech* is Continued.

1. From whence there is hope for those that have the stone. 2. Who is a Physician given of God. 3. What kind of honour is due to the Physician. 4. A fourfold ignorance of Physicians. 5. A philosophical history of the stone. 6. The error of Paracellus and the Galenists, concerning the foregoing matter of Tartar, and of the Stone. 7. An error of Paracellus. 8. An earth in the urine and venal blood. 9. What may be found in *Duelech* being distilled. 10. The simplicity of Physicians. 11. The miserable simplicity of Galen. 12. An Argument for the first matter of the Stone. 13. An examination of Diureticks or urine provoking Medicines. 14. Some most wretched Histories. 15. A resolving of a question of Diureticks. 16. From whence there is danger in Diureticks, and a happy fore-caution or prevention hereof. 17. A numerical account of Diureticks. 18. That a distemperature being converted into Nature, is to be corrected. 19. Whether a laying along on the sides, doth promote the affect of the Stone. 20. A various action of the spirit of Urine. 21. Vain are the fore-cautions of the Schooles. 22. A faulty Argument of the Schooles. 23. The inconsiderate rashnesse of the Schooles. 24. Why the touching may deceive him that hath the Stone in the Reines.

1 **G**od made not Death, neither is there Medicine of Destruction; nor a Kingdome of the Infernals in the Earth: Wherefore, I have believed, that no defect that is obvious in healing, hath issued out of the Treasures of Him, who made not Death, but Remedies: as neither was it from the error of his foreknowledge, that him whom he had chosen and Created for a Physician, he had every where left scanty, in many degrees or particulars.

2 He is not a Physician therefore, that as an Impostour, he should thrust onely a Cloakative and vain Remedy on the diseased with the stone. For the sick hath stood in need of a Physician, who might testifie by his good works, that he was so created of God. But after that Medicine was erected into a profession, through the itching desire of Gain, any wicked kind of men intruded themselves for Physicians: for the withstanding of which Error, the Magistrate ought of right, to be severely fierce against these men. The Schooles therefore, drew the choyce of Physicians to themselves, and accounted them worthy ones, as many as would subscribe to the Ignorances of the Heathen; that the Chaires and Life of man might be committed unto themselves. This hath now passed over through their hands, for a possession amongst the Europeans, for some Ages past; Charity hath grown cold, and sloath being introduced under a safer Zeal; long use hath also confirmed their obtained Ignorance, pretending a right of prescription. Wherefore God hath withdrawn his Gifts, and hath continued those, which he had bestowed elsewhere: Truly, Saint Paul will have Widowes to be honoured, which should be truly Widowes in good works: As for imitation of that Command, which hath appointed the Physician to be honoured, who should be truly a Physician in good works, and should testifie that he was so created and chosen of God: And whom indeed, the worthy Works, Commissions, Signes of his Calling, and deserts of his Honour, do follow.

Of which place, I meditating with my self, do find Honour to be denounced to the Physician by reason of necessity: which necessity presupposeth a proceeding Fruit; otherwise in vain: Not indeed, that the force of the Precept hath such an influence on necessity, as that, when a healthy person stands in no need of a Physician, this Physician is not then to be honoured: For a Judge, Major, Lawyer, Souldier, Serjeant, Executioner, Porter, Weaver, &c. should by the same right of necessity, be appointed to be

be honoured. Notwithstanding, in things mental or pertaining to the mind, the whole contexture of Words, is alwayes nothing else but as it were the conception of one word. But they will bear testimony to that thing, who have at sometime, perhaps intellectually and after an abstracted manner, tasted down something. And that thing also, may after some sort be demonstrated: For in the same Conception, whereby I consider a Sword, I conceive; first of all, a long, plain, cleansed, sharp figure; also a hard metallick matter, not flexible in the third of straightnesse; lastly its end, which is not to cut bread, or woods, &c. but to wound: For all those things are in one onely mental Conception of a Sword, at once represented unto me. But in mental Abstractions, not onely accompanying conditions; But moreover, whatsoever may be spoken in many houres (yet, nor can be expressed) is in one onely Conception, as it were of one word, infused in an intellectual Rapture. But Honour is prescribed for the Physitian created by the Goodnesse of the most High, by reason of the necessity of the sick, for the healing of them. The which surely, in mental Conceptions, hath a simple signification. But the necessities of the Souldier, Judge, Executioner, Weaver, &c. are not perfectly considered, as chosen by the most High: but as being promoted by men for the performing of Offices required from the malice of men.

Therefore I have elsewhere considered, that a fourfold darkness of Ignorance, 4 hath under a covetous desire of possessing, entered together therewith, into the profession of Medicine, and that they have left it without honour; To wit, the ignorance of Causes, manner of making, of the Remedy, and suitable application thereof. Truly, as the art of the fire, unlocks Bodies before our eyes; so it opens the Gate unto Natural Philosophy. The true Medicine therefore hath layen hid, as depressed under the Ignorance and sluggishnesse of the *Schools*: and that preparation of Medicine which ought to bring Light unto a Physitian, is wholly accounted mechanical, and conferred on the Apothecary and his Wife. Indulge my liberty, Reader, as oft as I dispute concerning God, of the Life, of Diseases, of the *Common-wealth*, of my Neighbour, of my own Calling, of that which is True, Good, of that which is hurtfull, and of things that are so serious, and of so great moment, in favour of mortal men. For I propose the allurements of no mans favour unto myself. I have hitherto shewn that blind descriptions have arisen from an ignorance of the Causes and Remedies, or from the sloath of diligent searches, and from the facility of assenting to false principles: Wherefore also, we consequently divine of the unprosperous Cures, deceitfull Healings, and desperate succours of the Stone; as also of the miserable obediences of the sick.

I will now proceed, For indeed, whatsoever ariseth anew in Nature, that is made of something, and so of another thing or Being; To wit, as their immediate matters being changed, it must needs be that the essences of those things are changed, 5 And therefore that something hath ceased to be; that this new something may co-arise from thence; And that is not done by a voluntary Resignation, or by a tying of the former Raines: but by the necessity of a new seed being brought in upon it, and by a ripened impresson, or from an actual disposition of an *Archens*, as a new Being in possibility. But seeing that which not as yet is, is not able as yet to act; it behoved, that that Being should after some sort fore-exist in possibility or power, that it may fit or suit the lump of the former Being subjected unto it self, for a future Being: But the fore-existence of that same Being, subsisteth in a certain seminal spirit, wherein the Types and shadowy foreknowledges of things that are to be performed in its Tragedy, do inhabit. But this spirit, I name the *Archens* or Matter-workman; call thou it as thou wilt. Be it sufficient to know, that nothing doth arise anew in Nature, without a seed. In the next place, Every seed operates by dispositions its Handmaids, which it propagates in the matter for its intended desires. But the mediating Instruments, whereby seeds do dispose of their matters, I call *Ferments*: For even as the sour odour of an earthen Vessel constrains the milk, the odour of Leaven infects the Meal, and the hoary odour of a Hoghead, converts the Wine into a losse of its strength, &c. So in the urine there is its own seed for *Duelech* (for I distinguish the stone from sand, onely in quantity, and signifie it by the one onely name of *Duelech*.) also its own dispositive Ferment, which is sometimes situated in a naked finell or odour. For truly, in an old and strong smelling Urinal or Chamberpot, the urine doth sooner stonifie than otherwise, in a neat one. Yet that fermental odour is not proper to the Urine, but a foreign stranger, which sometimes also, so increaseth itself in the Kidney; that like *Gorgon*, it alwayes and uncessantly labours in the framing of *Duelech*, as if it laboured for its own perfection. For so the *Archens* of the parts is unvoluntarily drawn unto a strange scope or aym, and through

the importunities of a strange Ferment, is led aside whither he would not.

- 6 *Paracelsus* therefore erres, who sets down a certain Tartarous muscilage, being dispersed through the veines, to be as it were the first and espoused matter of the stone: and exhorts that it be withdrawn by certain laxative Medicines. But I have given satisfaction unto these Trifles, as well in the Treatise concerning the causes of *Duelech* of the Antients, as in that of *Tartar*. For it is sufficiently manifest, that in mans urine (even in that of healthy Folk) there is alwayes an immediate, invisible matter and seed; For *Duelech*, whether the while, *Duelech* break forth into act, as long as the urine is ripened in our possession, or after that it hath flowed out of us: The urine indeed, contains essential beginnings for *Duelech*; but it is unto it by accident, that they are ripened or not: and although the urine hath in it self the seed and matter of the stone, yet it is not the womb of the stone, but onely the matrix of a stone-seed, which seeks and findes a womb for its self, either within or without. For as the Being in act, ought to perish, if the Being which is in possibility, and after some sort seminally fore-existing, ought from thence to arise: it is of necessity, that the essence and matter of the urine whereof *Duelech* is made, should first decay, if *Duelech* be made from thence: wherein notwithstanding, a small space of delay doth interpose. There is indeed in the urine a fit matter, and there is in it a seed for *Duelech*: yet it likewise stands in need of an actuating and exciting Ferment, which may procure the seed to bud; Because the transmigration or passing over of a thing, argues a decay of it self, by a neutral state, through a proper mediating Ferment: Therefore the corruptive Ferment of the urine is the exciter or stirrer up of the seed. Therefore I have shewn by handicraft Operation, that the urine is longer preserved undefiled, under the Balsame of our Family Administration, and under an ill-smatch'd heat, than that which else, in a cold Urinal, hearkens to corruption a few houres after, and therefore also defiles the Urinal with sand. For the Kidneys being after any manner polluted, have now conceived a corruptive Ferment of the urine. There is indeed, in the Kidney its own excrementitious Ferment, from Nature: but that is not yet sufficient for the propagation of the stone. There is therefore a *Duelech* in the urine, as a Being in possibility, which breaks forth into act, while the corruption of the urine, or of the former Being, hovers over it. In the mean time, it is true, that some *Provinces* do bring no sluggish ayd unto the frequency of the stone. For *Illyricum* was once populous, but at this day, almost a Desert: because it cuts off the life by a cruel exhalation. For there are some places, as it were subject to the Scurvey, Asthma or difficulty of breathing, or to the Falling-Evil: Not indeed (as *Paracelsus* supposeth) because such places are fruitfull in *Tartars*: Because that, since those of *Europe*, who are carried in the same ship, and have used the meats of our Country, are afflicted with forreign and local Diseases. For truly, there are some seeds of Diseases in places, and they forge fit matters for themselves, if they do not find them obedient or espoused to themselves. Let those Trifles depart, which suppose and require a naked allusion of a tartarous fore-existing matter, and so, a muckiness for *Duelech*, and do found them on a feigned Allegory of Artificial things: As if there were no other consistency of the stone, than what might answer to a dried muscilage? As if a snivelly Spittle cannot be generated of drink that is not slimy. As though the generation and hardening of every rocky stone, ought to be enrouled in snivel and heat? For if the heart, as it is hotter than the bones, so also should be harder, perhaps their Positions might deserve credit: But Nature despiseth similitudes that are fetch'd from Artificial things. Therefore I understand that a dungy Ferment of the Kidney being too much exalted, doth afterwards dispose the Coagulator, the Spirit of urine, and the matter of the volatile earth, that they may grow together into the seed of *Duelech*: For there is not a transchangative principle in Nature, out of the Ferments that are inbred, or obtained (even as elsewhere of *Ferments*) except in Artificial things constituted by the fire.
- 8 From whence also, every similitude drawn from the same, is unfitly applied. For *Potters earth* is after one manner burnt into a stone without a seed; and every stonification that is derived from a seminal Beginning, happens after another. But that there is an earth in urine, first the mechanical distillation of urine, proveth: And then, of the blood of distilled blood, there at length remaines much earth, which otherwise in time of nourishment, as being wholly volatile, exhales, is consumed, neither doth it leave any dreg of it self behind: But the earth becomes volatile in the urine from the putrified Ferment. A dungy putrefaction therefore growing in the urine: to wit, in the drosse or liquid dung that was brought thither, it sometimes obeyeth the Spirit the Coagulator: namely, as oft as a mutual action of them both is stirred up from the ferment of putrefaction.

I have distilled a *Dnelech* that was cut out of a man, by himself; neither have I extracted any thing from thence, besides a stinking spirit of urine, and a yellow Crystal, and also an Oyl, such as is drawn out of dryed urine: But that which remained unto me in the bottom, was a black, scorched, brickle, and un-savoury earth. Therefore the *Writers* of the first Beginnings of *Chymical Medicine*, deceive their Readers, as many as from the distillations of the stone of man, and its preparations, do boast of the *Ludus* of *Paracelsus*, or of the Prince of stone-breaking Medicines: For they have a desire to write meer, and a great many lyes. Neither am I sufficiently angry at the Impudence and rashness of these men, in a matter of so easie an Experiment; especially, when as any one might have fitly known that thing from the shavings of the Urinal. Surely, there is not so much as the least of those things extracted out of the stone of man, which those Instructors of Children do rashly write. It is certain in the mean time, that by the means of putrefaction, not a few things are made volatile, which before, their Closets being not unloosed, were more straightly bound up: For so also, Vegetables afford the more unmixed or meer waters to the Still, than themselves yet being not putrified. We perish not therefore by the stroak of one onely Weapon, since all particular ones which are mild, if they grow but a little exorbitant, do fashion new Calamities in us. For the substance of the Kidneys, being the hardest of all the Bowels, and destitute of sinewes and Arteries, was the fittest for a dungy Ferment of the urine: whereunto, if the Ferment even but of a fore-threatned putrefaction in the urine, shall have access, a speedy inclination into the Disease of the stone, is imprinted on the trans-liding urine. For truly, the odour onely of the fore-named putrefaction in the urine, stirs up a heterogeniety or diversity of kind, which was before hidden therein. For presently, the urine which lighted into a foul Urinal, becomes of a very stinking smell, and far sooner bewrayes the sand that was hidden in it, than that which otherwise was received in a clean Glas. For I have shewn by an undoubted experiment, that even the urine of healthy persons affixeth *Dnelech* on Urinals, in the form of graines, or scales: And that not presently after making water, that they do forthwith settle; but they are affixed some houres after: To wit, while the urine now unfolding the Ferment conceived in the Kidney, enters into the way of corruption. In those that have the stone of the Reines indeed, the urine receiveth a putrefactive Ferment, which otherwise is not communicated to the urine of healthy Folk, a dungy Ferment being otherwise sufficient for it.

Furthermore, it is not necessary that an actual putrefaction be in the Kidney, that it may stir up a sand within. Even as neither doth the urine in Urinals, as yet stink, while it now freed it self from the sand: but a fore-threatned or beginning putrefaction is sufficient, that the spirits may freely enjoy their right, and mutually (their Bolts being cast off) act on each other. But I suppose that to be a fore-threatned putrefaction, which is onely seminally in the *Archens* of the Reines, although not unfolded: For otherwise, if there were but the least actual putrefaction in the Kidney, a slow Fever would accompany that putrefaction: but of how small a quantity soever it shall be, it easily takes root within the urine, whereinto indeed a urinary-Ferment hath already pierced; the which, as it is in it self a dungy one, so also it is a putrified one. For there is an easie association of putrefaction, and of an excrement in a Fermental co-resemblance: Whosoever therefore shall endeavour, that his urine may not stonifie within: let him seasonably provide, that it do not unseasonably wax stony within him. For therefore, there are some Medicines, which tinge the urine and Kidneys with a gratefull odour, and for this cause are kind to their Organs. For as they are *Diureticks* or provokers of urine, they obtain a passage unto the Kidneys, and imingle themselves with the urine. For whatsoever things, through an occult, or manifest quality, have deserved the surname of *Stone-break*; do indeed cleanse and wipe off, and for this cause do comfort the Kidneys being threatned with putrefaction: but surely, they do not melt, or resolve any thing of the sand: Such as are sharpish Fountaines, *Diuretical* stones and herbs, which by washing off, and wiping away, do banish the sands and thinner clots: but do not dissolve them, and much lesse do they restrain the new Beginnings of the stone; Because they being destitute of a Balsame, and the seasoning of a gratefull Odour, do notwithstanding not appease the filthinesses of the putrefactive Ferment, however dull they as yet may be. For even as the re-budding of a plant, is not taken away by the lopping off its branches, but by rooting of it up: so neither is the stone of the Kidneys cured, by thrusting out of the stone. There is not any thing done that is worthy of Reward, If a person that hath the Falling-sicknesse be raised up from his fall, if he be not also freed from a Relapse for the future. Yet this top of perfection or healing, the *Schools* have not any thing touched

at: yea they have rather despaired thereof; because they saw that the contracted Membrish of the affect of the stone, did oft-times Tyrannize on the posterity, as being translated by an hereditary right.

10 For when *Physicians* had seen one that was cut for the stone of the Bladder, to have been afterwards free there-from, all his life-time: they promising to themselves, that the same thing would happen for the future in the stone of the Reines, concerning a Relapse: they being not any thing carefull of to morrow, perswaded the sick to hope well, they themselves at least, well hoping that they should receive money at the next Markets of its return. For they supporting themselves by blockish principles, must now and then use onely the more mild Laxatives, that they may brush off the foregoing lump or rubbish of the stone. For indeed they think, that they do wipe away all matter of the stone, out of the stomach: and in speaking seriously, They boast that by their blessed Looseners, they have provided for a Cloakative Cure, if the sick party were but readily obedient in a repeated going to stool, and the observed Rules of Dyet. But unto these Trifles I have abundantly given satisfaction in the *Book of Fevers*. For we are nourished of the same things whereof we consist.

11 Neither are the solid parts nourished, but by a spermatick slimy Liquor that is akinne unto them. Therefore the simplicity of *Galen* is the more to be laughed at, which forbade Membranes, Sinews, Cords or Tendons, and so, parts of the first Constitution, in Food, least a muscilage or phlegme should thereby grow: as being unmindfull indeed, that the similar parts in us, are immediately nourished onely by that vitall muscilage.

12 Nor in the mean time, do the *Schools* heed, that one of the Kidneys, and that one onely side, doth oftentimes breed stones, and sometimes waxeth totally brawny; when as the other doth in the mean time rightly perform its office for the whole life-time. From whence at least, it must be confessed; that the urine doth not stonifie in its Foundation or bottom, from its own vice, or by reason of a muscilage; (the which, be it already sufficiently suppressed before) in the next place, that it doth not wax stony from Dyet, and from the imaginous *Tartar* of meats and drinks: but that the Kidneys do through their own defect stir up a vitious Ferment, and at length bring forth this insolent Monster. For oft-times, one of the Kidneys hath a good while flowed with much sand, and afterwards is wholly stopped up with the stone. It well perceives indeed, a blunt pain of that side: but no sand afterwards throughout the life-time.

Lastly, the *Schools* indeed, take notice of that by Anatomy; yet, they do not as yet therefore cease to condemn the guiltlesse stomach, as bringing forth a rocky phlegme for the one, and not for the other of the Kidneys. Therefore it is beaten for the fault of bringing forth the Disease of the stone, it is swept with Besomes, it suffers the lesser and familiar Evacuations of three dayes: but the more rough punishments of solutive Medicines, it undergoes at the set interchanging seasons of the Year: Yea the stomach endures punishment, because Canteries are imprinted under the shoulders and hammes of the legs, for the preventions, wrestlings aside, and revulsions of a distilling phlegme, and other old Wives fictions of that sort: And the Tormenters do so much the more cruelly rage on the not-committed fault of the stomach, because this stomach suffers their Caution to be over-covered with a Scar, but *Physicians* do keep it open. As if a feigned phlegme, rushing down from the plaine of the Head, and remaining unchanged in the stomach, should slide through the Bowels, and should be again supt up by the *Meseraick* veines without any discerning of a hurt received, but should from thence again be carried unto the Liver and Kidneys: unlesse, through the skin being opened beneath the shoulder and Knee, it were revulsed outwards from its appointed Journey. Good *Iesus*! Thou Wisdome of the *Father*! Are these thy *Schools*, which propose such kind of Toyes unto silly credulous poor people? and which circumvent them with meer Trifles? Which torment Mortals with so many Butcheries? Far be it! far be it from us to believe this to be a Doctrine of Truth: that is, Thine. But the Enemy of the first Truth, the Enemy of Men, hath brought forth these trifling Discourses, and doth even still defend them.

13 But moreover, some prescribe *Diureticks*, and others in the mean time, being affraid of or driven from them: to wit, least the stone being driven forwards out of the Kidneys, shall stick in the way: For so an *Abbatesse* being oppressed with a descending stone, by the perswasion of a Circle of *Physicians*, abstained from a Urine provoking Remedy in the *Dog-dayes*, least happily, through the heat of that season, and of the *Diuretick* Remedy, the stone should wax big and harden. Therefore she waited for four dayes space with-

out

out sleep; with a cruel howling, untill the stone had of its own accord, arrived into the Bladder. And then the Council of the *Physicians* was triumphed in; and that unlesse she had observed that Rule, surely she had not kept life.

A certain Noble Woman being sorely troubled with the stone, and a Fever; after blood-letting being four times repeated, after Clysters, the lesser Evacuators, Laxatives, Vesicatories, and other Remedies of that sort, survived full ten dayes with out-cries for a Spectacle of *Physicians*; because they found not an hour that was free from the Fever, wherein they might give a purging Medicine to drink against the stone; neither otherwise would her strength be sufficient to undergoe a new tormenting Cruelty: For what things I have seen committed by *Physicians* in time of curing, under the Title or pretence of Heat, I could scarce with horror and Compassion, describe in a whole Volume.

For I remember that a *Jesuit* at *Antwerp*, in the Year 1606. both whose Kidneyes being beset with the stone, denyed the passage of his urine; at length, after two dayes Combate of *Physicians*, breathed out his Soul: For they debated about the shadow of an *Apulean asse*; to wit, whether a *Suppository Glans*, or a Clyster were to be administered unto him: They all abhorring *Diuretick* Medicines or drivers forward of the stone. In the mean time, *John Vermierden* a certain Merchant, having suffered a standing pool of urine for eight dayes space, and being now near death, took a Urine-provoking Medicine, of the juyce of *Palmer-wormes*, and of the juyce of black shell-fishes, wherein he had boyled one grain of *Cantharides*, to be drunk up at one entire draught. I let these things pass.

But I thus decide the Controversie of *Diureticks*. Every stone is either bigger than its *Ureter* or urine-pipe, or lesse, or equal. If it be lesse, urine-provokers shall be seasonable, and not to be feared: But if it be bigger than is meet; *Diureticks* shall be plainly unfruitfull and vain: But if it shall answer in equality to the Urine-pipe, it is better that the same be more speedily expelled, least it be encreased by delay.

Notwithstanding, because in the trans-passage of the stone, the *Ureter* being contracted by reason of pain, is for the most part crisped or frizled, *Diuretick* Remedies, are in the fit, to be given with a fore-Caution: To wit, those things that are to be given to drink, are to be Restrainers of pain, and of the Contracture sprung from thence. Through the carelesnesse or ignorance of which onely poynt; it sometimes happens that stones have stuck in the middle of their passage, and have kill'd the Patient with miserable howlings. And that not so much through the insolency of the *Diuretick* Medicines, as through the error of *Physicians*. For neither must we think, that the Channel or Pipe of the *Ureter* is of an unequal straightnesse, that the stone, which at the first onser descends through the *Ureter*, doth at length stick fast, as being pressed with the straightnesse of its Journey: But the future Compressions, are disease and convulsive frizlings, arising from pain, even as elsewhere concerning Sense and Sensation. And so, Fomentations or asswaging Applications, as well those that are external, as internal, which appease those convulsive motions, I chiefly exhort unto, and judge necessary. Why shall I not therefore distinguish of *Diuretical* Medicines, the Appointments, as well as the choyce whereof they have scarce been heretofore known. 1. For truly, some do sharpen or exasperate the urine with a Corrosive poyson: as *Cantharides*. 2. Others provoke and leave a tartnesse in the urine, and stir up the strangury: such as are new Ales. 3. There are some which render the urine absterfiv or of a cleansing faculty: as sharpish Fountains, the vitriol of Mars, the stone of Crabs; and likewise Herbs which in many places rejoyce in the Etymologie of *Diureticks*. And they all of them contain a volatile *Alkali* or Lixivial salt, or at leastwise attain that *Alkali* in time of their digestion. For, for this cause, prouokers of urine, do for the most part conduce unto a vulnerary drink: Because that in every Wound, a Tartnesse or Acidity, the Betokener and Companion of all putrefaction in the flesh, doth arise: the which *Alcalies* do easily sup up into themselves, and consume. Wherefore there was a Country man, who healed wounded persons with the *Lixivium* of Teile-tree. So the stone of Crabs being boyled or steeped in Wine, doth notably represent the favour of a *Lixivium* or Lye. 4. There are also some which provoke urine, and stir up the expulsive faculty thereof, as they do generate a putrefaction of the urine: Of which sort, are the *Radish*, *Asparagus*, &c. For I have seen a Lawyer, who was not afflicted with the Disease of the stone, but after he had returned home from a more large eating of *Asparagus*: and afterwards, that he lay along under most cruel pain; not so much from stones, as from most subtile sands, through the returns thereof, perhaps every fifteen dayes, for some years. From whence I learned, that the error of one evening had brought an ill habit on his Reines, which could scarce be taken

taken away for the future. I also, from hence, knew the proneness of our nature, which so quickly hearkens unto its own ruine, and that it having once fallen or slipt aside, doth slowly and difficultly rise againe, even by the Favour of medicines.

- 18 Lastly, that such a kind of habit, now for some years persevering, hath nevertheless been corrected; and so that those inclinations which they call distempers converted into nature, are moveable, and seperable, contrarie to the dispaire of the Schooles. 5. There are also diureticks, which refresh the urine and kidneys with a gratefull odour: As *Mace*, *Nutmeg*, *Terpentine*, *Mastick*, *Juniper*. &c. As though the kidneys being comforted with their odour, were made mindfull of their office. 6. And then, there are some also, which from a Lixivial Alkali, do in time of digestion, passe over into a tartnesse, cleansing the passages of the urine like sope, do stir up the expurging faculty, and do cut the filths grown thereunto: of which sort, are those medicines which are collected from the shells, and stones, and ashes of appropriated things; and the which alone, seem to be worthy of the name of stone-breakes, especially if they are drawn up unto a degree of volatility: 7. In the next place, there is a sort of Diureticks, which being taken in a smal quantity, do powre forth plenty of urine out of the whole body: as *Palmer wormes*, the species of *Brooklime*, and likewise the juice of *Sea shell-fishes*, black and long: and whatsoever things do containe a volatile nitre, and which do by property, rowse up the sleepey reines. 8. There is also another sort, which by way of sticking, comforts the reines, being profitable for the allaying of their paine: Such as is in *Saffron*, *Rhubarb*, and *Cassia* being inverted, that is, being first deprived of their solutive virtue. 9. The spirit of *Sea salt*, is not only a provoker of urine, and doth not also, only assuage the strangury in those in whose bladder the stone is rowled: but besides, it diminisheth the stones of the kidneys, if it be distilled with the utmost heate or fire of a Reverberie. Therefore it is not sufficient to say, that Diureticks do create urine: but moreover, it must also be determined whether they act that from an excitement of the attractive faculty whether by a dissolving of the urine, whether by an exasperating thereof, whether by a speedying of putrefaction, or lastly from any other title: neither is it sufficient for whey of milk to containe some thing of a nitrous matter in it: but also it hath some certaine remainder of its former blood, from whence it is cadaverous or stinking, and so keeps the tenour of *Asparagus*. For truly, many things do, by comforting of the reines, provoke urine, and other things overspread the urine with a gratefull odour, and others are the more troublesome, through a sharpnesse, as also those things which hasten a stinking ferment of the urine, the which are hurtfull unto the diseased with the stone, in their whole root: and therefore with the great error of Physitians, is *Asparagus* boyled almost in any *Apozemes* whatsoever. Moreover, I was at sometime afraid of an ordinary laying down on one side: because the upper kidney would be stopped up by the incumbent weight of the bowels, and the urine standing like a poole therein, would become sandy, if it should dayly be there shut up for many houres: Especially, because the upper kidney is distant from the *Vena Cava* or hollow veine, at least ten fingers in breadth: and because the bladder is of a middle scituation between both kidneys. Therefore I perswaded my self, that the upper kidney could not unloade it self upwards into the bladder: But afterwards I knew this my fear to be vaine, and that nothing was beneath, in respect of the *Archeus*: neither was it sufficient to have speculatively searched thereinto. Therefore there was fitly one made known unto me, who had never layen on his left side from a boy; Also that he being now an old man, had not yet suffered the disease of the stone. I observed also another, who had never slept but on his loynes and right side: yet he became stony in his left and declining kidney. I repeat hear, that the clear and distilled liquour of my own urine, carried its own earth up with it, through the Alembick, which it conformed and affixed to the sides of the vessel, into a true *Duelech*: and that, that hardening was made by the Spirit of the urine, which coagulates any thing, and many things after a diverse manner.

- 20 For it condensed the spirit of wine into a volatile lump. But if it findes a fixed object, of the nature of a Salt, it is turned into a Salt, even as it happens unto spirit of wine, from the salt of *Tartar*: or while the spirit of fountaine salt being drunk up by salt its kinsman, is made salt. But if the spirit of urine find a fixed earth which it may gnaw, seeing it wants a coagulable object, it is imbibed by the earth, and subdued hereby: and it being otherwise the Authour of coagulation is there coagulated passively. But where the spirit of urine findes a volatile object that is not coagulated; yet coagulable

(because of an earthly disposition) it uncloathing its own *Coagulum* or runner, constrains the same vapour into an earth; and both their forces being conjoynd, a new creature is made, which is the nativity of *Duelech*.

But moreover, the Schooles insisting on their own principles of heates, prescribe, ²¹ that the Patient must not lay on his back, also that his loynes are to be anoynted with cooling oynments: yea that a plate of lead is to be locally borne upon them. They command a bed of wool, instead of a bed of feathers, lest his reines should wax hot: And moreover, between the bed cloathes and the bed, they spread a hide of leather: For indeed the Schooles are busied only about subduing of the effect, and have respect only unto the product, or effect; but in no wise unto the cause, not so much as to the occasional one. For by watching diligently over trifles, they successively subscribe unto each other, without any observance of help: And so they seriously dream waking, that they may flatter the sick. For neither are stones bred, because the loynes are hot; but the loynes are hot, because stones are bred.

They therefore chuse wool or flocks before feathers, by reason (they say) of ²² the heat of these: As being ignorant that feathers do lesse heat, than wool, by reason of their exact exclusion of aire; which thing the sense of touching may judge of.

In the next place, it being granted, that the feather should more heat the body lay- ²³ ing upon it, and that is wrapped in feathers, than wool; Yet all that ceaseth, if a sheet interpose between the feathers or wool. For truly, the heat which issues out of the feathers or wool, is not the very heat of these simple substances: but the reflex heat of the party laying thereon, and being received in the feathers, or wool. For it being from thence layd aside in the middle of the bed, returns through the sheet, not indeed stronger than it self was before, but being almost suitably co-tempered with the same importance of heat, wherein the body it self is prevalent. But the very glassen instrument that was framed for the measuring of the temperature of the encompassing aire, visibly determineth this controversy: whereof in our elementary principles. Neither doth it argue to the contrary, that he that hath the stone in his reines, feels himself hotter in a feather bed, than in a flock bed. For that happens not by reason of the greater heat of the feathers: but fitly, because the patient is sunk deeper in the feather bed: but he layes only on the top of the flock bed, and the cooling aire blowes on him from the sides. Will the Schooles thus never distinguish of any thing from its foundation, Cause, and Roote? And (with rustick wits) will they alwayes savour of the heathenish opinion of heat and cold? I intreat you for the love of God, wherein, every one, when this life is finished with him, can desire that he may be beheld, cast away stubborneesse, presumption, and sloath; and do not despise a better doctrine.

Tttt

CHAP. VI.

CHAP. VI.

The Womb of Duelech.

1. Why the womb of the Stone is to be sought into.
2. The bladder also, generates a stone of another condition, than the kidney.
3. Prognosticks or presages.
4. Heate doth not coagulate any thing in urines.
5. Another necessity of the womb.
6. The scituation of this womb.
7. A handicraft operation.
8. Observations had from thence.
9. The extension of this womb is conjectured of.
10. The reason of wonderfull events in those that have the stone in their reines.
11. From whence there is a relapse in the stone of the reines.
12. The stone of the reines hearkens unto meteours.
13. The manner in making thereof.
14. The urine, why it is troublous or foule.
15. The paine of the stone of the reines is from a contracture.
16. They are deceived in the cause, who bring the straightnesse of the Ureter, as for the fiercenesse of paine.
17. The ignorance of the womb hath caused a neglect of the cure.
18. A fabulous perswasion of the Schooles.
19. Another necessity of relapses.
20. The clearing up of a certaine doubt.
21. A history of a mad man.
22. The seperation of the urine from the venall blood.
23. The disorderly generation of a strange stone.

THe seed, matter, and proceffe of making the stone in man being already made manifest, and the urine being known in its contents, as it is, the seminary vessel bringing down the seed of the stone; yet, there hath not as yet been enough spoken: For truly, one kidney being safe and sound, the other only, is oftentimes stony. It is not sufficient therefore, to have accused the common Beginning of the urine; and therefore this is the more powerfully to be imagined, that every generated Being presupposeth a certaine womb, from whence, to wit, the product it self doth now and then obtaine no sluggish disposition. For it is of necessity that there be places, wherein things may be made, before they are bred, and that, as well from the priority of places, as of motions. For the urine is already materially in the liver, yea and in the mesenteric veins, before it be in the kindeys: Nether could the reines by a seperation, sequester the urine from the venall blood, unlesse the urine and the blood where now the while, really distinct. But if it be urine, before it come down to the kidney, or unto the sucking veins, it must needs be also, that the stone is after some sort prepared before it come unto the Innes of the reines. For if the dung begins to be prepared, even from the beginning of the gut *Duodenum*; why shall not the same thing happen to the urine? Wherefore it hath seemed to me, that neither also could the urine performe the reason or office of the womb of the stone, and much lesse the Reines themselves, so great is the hasty passage of the urine thorow them, as it were through Syringes: wherefore it hath behoved me, first to give heed unto the womb of this monstrous offspring: especially, because the *Schooles* have even hitherto, skipt over this top of knowledge, as being content with the judgment of the vulgar, nor being wise beyond the country folk, who behold only the reines and bladder: But surely the mine or womb doth euery way cause a great diversity of the thing that is to be born, if it for the most part, containes the fruitfullnesse and barrennesse of generation. For if nature be subject to the Soyle: certainly nature cannot but be in a womb, especially, if she stonify in one of the kidneys, the other remaining safe. And that thing is chiefly to be contemplated of, from the same, and in the same matter of the stone, and urine of one feed. From the womb therefore and not from elsewhere, is the cause of the far fetcht infirmity, to be required.

For the bladder also, and the same urine in number, procreates a *Duelech* of another condition, than that which is made in the kidney, or at leastwise, which was never made before. For indeed, I am not wont to subscribe to the naked pleasures of Predecessors, as neither to their Judgements, because I am the more assured, that the very power of healing, languisheth under their unaptness: Therefore I ought to search out the womb of *Duelech*.

First of all, I have espied, that those that had the Stone in the Reins, were wont, for the most part, before their future pains, to presage their malady to be at hand, from their watery, untinged urine: But that afterwards, when their pain was present, the same urine was abundantly much, and troubled, like yellow Ale not yet refined. And that, when afterwards, a more subtle or thin urine, well mixt with sand, flowed forth, they testified, their pain to be manifestly slackned, or almost none at all: Yea, although for some days there remaineth a continual urine, sometimes bigger than both kidneys: Then also, I beheld a continual and plenteous Bole or lump, to be daily cast forth with their urines, in shew of a powder unperceivable by the touch.

A certain one also I beheld, which would dissolve only with heat; (so far is it that heat should be the author of curdling) yet oft-times that lump being seperated from the urine, was not again afterwards founded in hot water; but that, by rest, it at length settled to the bottom, which before, was solved in the salt of urine. For I always believed, that seminal Generations were made from a disposition of the matter; and that the perfection hereof, was by little and little introduced through the labour of the *Archeus*.

I knew therefore, that the generation of *Duelech*, doth follow the laws of other natural generations: and so also, that it is made at an instant; and by consequence, that the preparative disposition, or the dispositive preparation thereof, is indeed introduced by degrees: Therefore I concluded with my self, that this whole Nativity of the monster, and the preparation thereof, is not finished in so hastned a passage through the kidneys; especially, wheresoever that lump doth sometimes occupie a third part of the urinal: Yea, the sand that is cast out at one only making water, doth now and then equalize the half part of the kidney: That, in the mean time, I call not to mind the slenderness of the bowes of the kidney.

Therefore I have deservedly suspected, that the reins only, are not the womb of the sands, of the Bolus or lump, and of the Stones; but that these do prepare their own products by foregoing vessels, wherein the urine is disposed, and that the full essence of *Duelech* is there obtained: To wit, that the fundamentals of those things are stamped, which anon appear to be. But that I might expel all scruple from me, or that I might not believe, that the urine doth by a momentary passage through the kidneys, being as it were, more swift than the glance of an eye, act it self into a lump, sand, or greater Stones, and then afterwards be cast head-long through the urine pipes:

I collected the urine of him who was grieved in one only kidney, and which had voyded both sand and lump; and then I strained the urine from the sand through a Towel; yet I discerned, that of the same urine, no less sand and scales had afterwards adhered to the urinal, than if it had come forth without a lump or sand.

On the contrary, I also found, that the urine which had once applied its sand to the urinal, had laid aside no more sand in a new urinal for thirty hours after, but only a sediment that was to be washed away: Therefore I was assured, that all that sand was cast out with the urine of him that had the Stone, neither that it had belonged to that sand, and to the same urine, the ground whereof it had now required to be. Consequently also, that the sand that was afterwards pissed at successive and continual turns, was not the product of that urine alone, nor made, or begotten through the delay of collection of that urine: yea, seeing otherwise the kidney, being four times bigger than it self, should now and then not be sufficient for entertaining of the sand flowing down by that fit: Therefore I have learned, that the watery and untinged urine was the fore-shewer of the future sands and fit, and the presager of the future pain; or that, from that very time, it laid aside the foundations of dispositions in a certain hollowness, perhaps bigger than the bowes of one kidney: Wherefore I conjectured, that the womb was more capable of the sands, lump and stone, than both the bowes of the kidneys were: For one is a central borderer on the urine-pipe; and the other, is a winding one, circumflexed, or bending about throughout the body of the kidney. For I greatly wondred, that the urine waxed not yellow on the first days, yet that abundance flowed forth; nor

that the dross being the tincture of the urine, should then according to its wonted custome, be attracted: as if all the tincture thereof, being for the framing of the urine, were wasted; or, as though the sands were made of the meer tincture of the dross; and so that the mixture of the liquid dung with the urine, was a disease one besides nature, although ordinary: which meditation indeed, at my first entrance therein, afflicted me: At leastwise from thence I more clearly knew, that the material cause of *Ductech*, assigned by the Schools, was altogether vain and stupid: seeing that if there were any whitish and phlegmie muckiness cocted from the heat of the kidneys, into a stone; Now the sand of the reines should not be of a more citron colour than the stone of the bladder; but both stones should be alike pale; because the cocting and drying of that mucky snivel, cannot citrinize the pale colour of the same; or in the bladder, under a longer delay, it should be wholly yellow, unless pethaps, the Schools shall demonstrate, that the Muscilage of the kidneys is yellow, and that of the bladder white; Else surely, they reach old wives fictions concerning the muscilaginous matter of the stone. Furthermore it hath seemed to me, that the urine is cleer, plenteous, nor tinged before the fit; and troublous, and sandy, after the pains; because that while the sand is in making, that happens in the *vena cava*, and in the sucking veins themselves; it not being indeed, as yet in the form of sand, or of a stone, but like a lump, like a more thin clay, and like a sediment. And so the urine is not then duly concocted in that kitchin; wherefore it is watery, and the *Archens* of those parts is primarily, ill affected. But I understand the coction or digestion of the urine, to be the promotion thereof unto a urinous perfection: for there is not yet in that very place a sand, but the most small atome of a *Bolus* or lump: Because a corruptive ferment is there established, besides nature, and the requirance of the place: but by how much the farther it departs from thence toward the kidney, or unto the last sink of the urine; it is also more and more burdened with its own urinary ferment; and *Ductech* receives an increase almost at every moment, and is by degrees confirmed into bigger grains; For I did argue, if a vein even after death, preserves the blood from curdling, contrary to corruption, it should not be unmeet for a certain preservation from a stonie coagulation, likewise to exist in the wombs or veins of the urine; but that this preservation is very strongly trampled upon by a vicious ferment of the neighboring-kidney: The which, when it hath once seriously happened, so as that the veins have but a little departed from their native goodness, it befalls these, as to any kind of impure vessels, and those molested with a neighbouring stinking, or strong smelling ferment, whereunto something of the residing impure contagion, doth stubbornly adhere: for such is the continued succession of relapses in those that have the stone in the reins, that all the dreggy filth adhering unto them, is not fully wiped off; and that there is the same neighbour character of the bad disposition, which forged the former calamities. After the same manner, whereby a hen carries mature eggs, and those less mature, and others, like grains, in her loynes, which are the pledges of a birth successively to follow for some moneths.

- 12 This indeed hath been the necessity whereby those that have the stone in the Reins, do for the most part, obey the importunities of a Meteor, do also presage future tempests, and the pains of these do ascend from the loynes into the back; Because while somewhat more of those filths is now affixed to those veins or wombs, they are grieved and contracted, at least, on that side whereon they are molested; or on both sides throughout their loynes, in a like manner: Under which contracture, and wrinkled frizzling of
- 13 the veins, a pricking, lancing, and, as it were, renting pain ariseth. And the more gross atomes which were collected in the sucking veins, fall down in that frizzling, unto the kidneys: a lump in the mean time, remaining for a pledge, being as it were the seminary or seed-plot of the next fit, even untill the mature ripeness of its age. In
- 14 which painful convulsion of the veins, the liquor latex, doth at length, speedily run from far, out of the veins unto the kidneys for help; or is drawn thither, and being obedient, flowes thereunto: from whence there is a disturbed urine. But what that latex is, which seeing it is not urine, yet it is mixed herewith, hath been largely enough declared by me in its own Treatise. But after that, the small pieces of sand and stones are cast forth, and the pain ceaseth, because the contracture of the veins ceaseth.

- 15 That cruel pain therefore of the diseased with the stone of the kidney, ariseth from the contracture or drawing together of the veins: but not from the passage of the *Bolus*, or sand. For oft-times a great stone is afterwards less painful, which at first being but of a small bigness, was exceeding painful: not indeed that the Ureter is become larger than it self was (even as the Schools, otherwise think) but the convulsion was greater while the
- the

the malady was unaccustomed. For otherwise, if the Urine-pipe should undergo so great a largeness, they contradict themselves, while *Diuretick* Medicines forbid the straightness of the Vessels. And then, I have further considered, that about the beginning the urine is voyded clear, watery, and abundantly: For since the urine is tinged by the dross or liquid dung: but since that dross is not drawn forth, but nigh the end of the *Gut Ileos*, and nigh to the fewel of the Ferment of the dung; From thence it comes to pass, that that dross is not allured from so far a distance under the confusion of the fit at hand: for that the Family-administration of that *Kirchin*, is confusedly troubled and interrupted: Because the stomach, together with the whole *Abdomen* or neather-belly is disturbed, and in a guess or fear, fore-feels the storme at hand, no lesse than it co-suffers with the same, and undergoes it, being present. For it seems to fore-feel the sand, not yet seen: but surely, it is then present in its own womb, and while it is fore-felt, from that very time, the beginning of that contracture is present. The *Archens* therefore being willing to wash off the enemy, and excuse the fit at hand, calls to him from on every side all the *Latex*, and sends it down to rince the Kidneys. Therefore the veines are contracted in the stony Reines, and the Bowels consent; and therefore by reason of their consent, they dissemble the pain of the Colick. For which cause, the pain of the stone in the Kidney, is not yet sufficiently distinguished by the *Schooles*. Neither is it a wonder, that at the convulsion of the veines, the Bowels themselves are also convulsed or pull'd together: seeing contractures of the Joynts (by reason of the near affinity of consent) do follow as well the cruel paines of the Colick, as those of the stone in the Kidneys. Far therefore do the *Schooles* wander from the Truth, as that the dross is drawn or sent, for the framing of the stone: but rather the tincture thereof comes upon the urine by accident, while the Spirit the Coagulator uncloathes his power on the volatile earth: Because other things being agreeable, the stone that is tinged, is alwayes more brickle than pale ones. And that thing clearly argues, that the tincture of the urine, if it could, would totally hinder the composition of *Duelech*. And therefore those that have the Jaundice, although they are otherwise subject to the stone; yet in time of the Jaundice, they are scarce seen to be stony; For therefore in time of the generation of the affect of the stone, the urine, at the first conception of sands, waxeth yellow, and looks pale about the beginning of the fit: Because then it is as yet, *Latex*, and not yet meer urine. Therefore, I have certainly known, that if all the sand which is voyded should be made onely in the bosome of the Kidney, the pain would be greater while it is voyded, than while the sand doth not yet appear: The which notwithstanding, contradiceth experience.

Moreover, because the sand being once bred, the urine is troubled more than it was wont, and becomes thicker; seeing otherwise, a troubled confusion perswades, that it contains more of a poudery matter (for in a more gross consistence, there is more powder than in that urine which is at first clear and watery:) That plainly convinceth, 17 that the womb of the affect of the stone, is already filled up; neither that it can entertain that more gross balast. Therefore the variety of the Womb being unknown, hath neglected not onely the curing of the stone in the Reines, but hath also, introduced interchangeable alterations of its causes and curing. Indeed it is one thing for the sand floating from the Kidney, to be thrust down by a succeeding drop of the urine: and a far different thing, to shake off the adhering sand, not indeed through the water washing it off, but from a conspired convulsion and frizzling of the parts.

For they perswade, by the *Marsh-mallow*, *Mallow*, Oyl of Almonds, and the like, to 18 assuage paines, to moisten, enlarge, and besmear the passages: and so in this, as also in all other things every where, the *Schooles* are either intent onely on the effect, or propose that which is ridiculous: while, as they ought by a cleansing faculty, to brush off the sands and lump, from the whole Womb, they totally employ themselves in loosening the passages, and in moistening the membranes, which are alwayes most moist in themselves.

For truly, although the sand be expelled, yet the womb thereof is not therefore safe: 19 but at leastwise the sides of the veines, remain defiled with the *Bolus* or lump, for a future punishment of the stone; whither the *Schooles* hitherto have had no regard.

For I sometimes wondred, that he that a good while before had the stone in his Reines, 20 after he hath dismissed that stone into his bladder, doth the more seldom stir up new stones in his Kidney, as long as the other molests his Bladder: yet that he that hath the stone in his Reines, if together also therewith, he be gouty, doth notwithstanding admit of the Gout as a Companion with the fit of the *Nephritical* affect or stone in the Reines. For

from thence I have learned, that as pain in a Wound, stirs up a sandy or gleary water, so also, that it can change the urine it self, which may hinder stonifying in the antient womb of the Loynes. Wherefore also, there is a troubled urine (and that without sand) seen in persons that have the stone: For the pain is the Trumpet, which occasionally calls to it, the Latex from on every side, which inflames, yea and disturbs the urine with a strange Guest being admixed with it. But in so great a confusion of Offices, nothing is thought of the confusion itself: For the pain hath oftentimes set before mine eyes, the Image of fervent heat. For water, after the boyling up of heat, is for the most part troubled and confused: For so, because there is a *Bolus* made of the volatile earth of the urine that is not yet sufficiently seasoned with a salt, by reason of the want of an Urinary Ferment stablish'd in the Reines: therefore also, that *Bolus* or lump melts with the fiery heat; neither is it constrained into the more hard and great sands, as long as it doth not experience the force of the Ferment of the Kidneys: But the *Bolus* is sufficiently tinged, not indeed from the dross, the more lately coming thereon, which tingeth the Sands (for that red lump is beyond the yellownesse of the dross) but from the washy venal blood, which is erroneously translated in the veines (the womb of the *Bolus*) for uses, being the ends of Turbulency. And for this cause, in the signification of urine, the *Bolus* testifies of the Liver and venal Blood; but the sand nothing of these.

21 It is manifest therefore, that the urine is by it self salt, although a man be not fed with salt, and thou shalt find the cause thereof concerning Digestions.

A certain *Curate* in our City, being beside himself, passed over 17 whole dayes without any meat and drink before his death; but he never wholly wanted a daily urine, although a more sparing one, and by degrees, a more red one departed from him. From whence I conjecture, that there is in the Kidney an exchangeative faculty of the blood into urine (and the which faculty, I elsewhere, in the *Treatise of the Dropsie*, do studiously prosecute) no otherwise than as a Wound doth of the blood, prepare a speedy and plentiful *Sunovic* or gleary water. Therefore the urine, for the last limitation of it self, requires and borrowes a virtue from the Ferment, which the Kidneys do inspire into the womb of the urine: No otherwise, than as the Liver inspires the faculty of blood-making into the veines of the *Porta*, and knittings of the *Mesentery*: Wherefore the whole Chyle of the stomach doth in the same place presently dissemble blood in its colour. But the plainly Lord-like power of the Kidneys over the veines, I elsewhere prosecute concerning the *Dropsie*. But although the Ferment of the Kidney, serving for the ministry of the whole entire urine, be as it were the digestion of a certain Bowel; yet it is not reckoned amongst the number of digestions, because it concerns the concoction of a superfluity, but not of a nourishment.

22 For since every transmutation which proceedeth by digestions, hath its own Medium's or proper Ferments, which are fit for a new Generation; also the Kidney begins to imprint its own Ferment on the Creame, presently as soon as it is stayed at the ports of the Liver: Through the vigour of which Ferment, the urine sequesters it self from the venal blood, in its native properties; And although that blood be not yet coagulable: yet the liquid from the liquid do there separate themselves. The Myserie of Sanguification or Blood-making, is indeed homogeneous, simple, and altogether single, and so included in Sanguification alone; yet a separable unlikeness ought to be bred in the Cream, presently in its entrance of the *Port-veine*: For else, the blood, while it attained a vital condition in the Liver, would undecently be defiled with the blast of the Ferment of the Kidneys: But that the urine is naturally salt, and from whence that salt-ness is unto it, thou shalt find elsewhere concerning Digestions. But here, let it be sufficient to have given notice, that as much of an acide salt as is bred in the Chyle under the first digestion; so much passeth over into a salt salt, by a substantial Transmutation in the second.

23 I have now pointed out the womb of the Urine and Stone, beginning: I have also declared the wonderfull property of the Spirit of Urine, in coagulating, and stonifying: From thence also, it now is sufficiently manifest, that if the spirit of urine happens to flow by a Retrograde motion, through the Liver, into the *Port-veine*, and from thence to be expelled, as an unaccustomed stranger, through the *Mesentery* into the Bowels: that it shall there also easily coagulate unwonted stones; and the which *Paracelsus* calls *congealed*; but not coagulated ones; because they ascend not unto the hardnesse of the *Duelech* of Urines: the which are confirmed from their mother-matter, a muscilage. But if indeed, the spirit of urine be carried upwards or downwards through the hollow veine; it by a faculty proper unto it self, estrangeth the spermatick and muscilaginous

nourishment of the similar parts into a more hard compaction: from whence at length, *Scirrhus's*, quartane Agues, and also divers obstructions do arise: the which surely, they do vainly endeavour to brush away by Juleps, or *Apozemes*. Lastly, the Gaul is nourished by the venal blood its Neighbour; whereinto, if the spirit of urine shall wander out of its own womb, stones are presently bred also in the Gaul. For whatsoever enters into anothers harvest, becomes foreign and hostile, and so, extraordinary affects do arise from co-like Causes. For neither have I unfitly taught, that, that wheyish matter which is carried, as being thoroughly mixed with the blood, and is by sweat or otherwise, unsensibly dispersed, is not urine, as neither that it hath the properties of the same; nor that it is a whey, the imitator of Milk, and much lesse that it is Gaul, or yellow Choler: but a part of the Liquor Latex; of which, in its own Treatise.

CHAP. VII.

Duelech Dissolved.

1. The inconsiderate rashnesse of the Schooles is accused. 2. An account or reckoning up of Knaves, over whom the Magistrate ought to be intentive. 3. The Author excuseth himself. 4. Every Disease in its own kind, is curable. 5. How much is to be hoped for from the Shops. 6. Or what may there be found for the Disease of the Stone. 7. A double Indication or betokening. 8. A somewhat deaf intention of the Schooles. 9. The vanity of this kind of intention. 10. Why the Marsh-mallow, Mallow, juyce of Citron, &c. may profit. 11. A frivolous objection against Urine-provoking Remedies. 12. The impossibilities of the Schooles. 13. The Reasons of the Schooles for an impossible Remedy. 14. The Reasons of the Alchymists. 15. The testimony of Cardanus. 16. The writ or Charter of the Prince of Saltzburge. 17. The delusion of the Schooles from a ridiculous enquiring into Remedies. 18. Ridiculous privy shifts. 19. That the Stone is not confirmed. 20. The stones of Animals and Vegetables, after what sort they may be profitable unto us. 21. The manner of preparing them. 22. From whence Ludus took its Name, and the preparation thereof. 23. Ludus, where it is to be found. 24. A blockish boasting. 25. An error of Paracellus. 26. The rashnesse of the Schooles. 27. Paracellus prattles no lesse unsavourily concerning the matter of the Stone, than the Humourists. 28. A declaratory confession of things unsoulished: and of the Balsams of Sale. 29. The manner of administering a Remedy. 30. The Bladder of the Bull-Calf being an Embryo. 31. Observations about the stone of Crabs. 32. An Error of Paracellus. 33. A wondrous Antipathy. 34. A new Character.

I Have spoken of the Womb of the Affect or Disease of the Stone. But now I must seriously consider of its Remedies. For indeed, the common people laugh at the Schooles, who are become a Reproach, because there hath not been any thing hitherto, diligently searched into concerning the true Causes or Curing thereof. I have indeed elsewhere rehearsed, that the power of the mind being as it were barren or feeble, hath acted the original of Medicine; & that Medicine, being also in its rising Yeares, even unto this very day brought into a Circle without any progress; because they have been willing rather to abide in foreign, Grecian, Barbarous and Heathenish Inventions, and have held it an Honour to have polished other mens Principles. While as in the mean time, new Diseases arise: also those that were once spent or grown stale, do rise again masked; and therefore do they appear illegitimate, nor any longer answering to the descriptions of the first. For indeed, Medicine stands without any progress, while as our health stands in the greatest need

need of the increase of healing: As a slow and ungenerous kind of *Physicians* hinders the same, because they would be wise only by anothers commentary, and deny Art to increase above what they have known: And therefore also, whatsoever they are ignorant of, they by a certain despair, drive away into the Catalogue of incurable Diseases. As if the inventions of Ancestours, had stoppt up the way of our industry, had shut up the treasures of wisdom, and as if all the modern force of the mind were barren, and the power of divine wisdom exhausted, that there were nothing any longer, which may demonstrate unto us a further truth.

Truly the cup of sloath hath even from the very beginning, besfooled the world with a Lethargy; for therefore, every one, had rather to assent, than diligently to search: For so great is the sweetness of gain; that every one doth with love, admire his own societies or confusions, and Miscellanies of Medicines (they call them received Magistral) and those Medicines which being in times past the more secret ones, have rendered Physicians that were Lovers of labour, famous: old women, by reason of the drowsiness of *Physicians*, have at this day, spread abroad into the hands of Apothecaries.

From whence, every Barber, Barher, Nun, Tormenter, or Bawd that was chased out of the Stewes of harlots, boasts of medicine; the number whereof I will here describe.

2 For those first come to hand, who will heal, being indeed not instructed for this purpose; but being prompt by nature, and daring to do any thing, hand forth those things to the sick, which they have heard to have profited others, without the knowledge and difference of causes; and so they drive them head-long into danger. For from thence, almost all the experiments of the Schools have issued: The which also, *Galen* after the example of his Master *Quintus*, hath confirmed: For the Schools making experiments by the deaths of men, presently call their Graduates, most expert Physicians. Others being vulgar ones, had rather heal only the vulgar; and unto these they give their Counsels: Some also, from favour alone, and being entreated. Many also, by reason of the ambition of honour, and that they may seem as wise men, have this kind of vice bred in them; for such kind of Deceivers will seem to be rich, and therefore they perform all services for death, or a chanced health, freely.

Of this sort are those first of all, who at *Rome*, thrust a Triacle on the Cardinals and Peers, as composed of better Simples than God hath created in nature: For so we have deceived the people in the City, and have seemed to be holy Apothecaries. There succeed these, such as require rewards indeed, but in no wise money, lest they should be known to have put off the condition of Noble persons, and likewise their promised poverty: And therefore they are those, who say, they earn or merit nothing for themselves, but only for a poor Community. There are Apostates like to these, who confess indeed, that they are not Physicians; but that they have their secrets from a Queen, or an Emperor: For these are wont to interpose as middle persons, which extol the price of their medicine. And then there follow these, who wear garments and a purse bored full of holes like a sieve; neither, in the mean time, are they slow to exercise, of their own imposture: As that they were sometimes very rich, but now impoverished (in a hogs-head of wine) by the Art of Chymistry, by Wars, and by the constancy of Religion. There are also those, who at sometime were valiant in a troop of Souldiers; but in War (for the conflicting for moneys) they bestowed all their wealth; they shew their scars in a bravery, perhaps being received as a due reward. Some also have left wives and children, houses, and Altars, and the pleasant fields of their Countrey, for the worship of Religion. Many also are poor of their own accord, because no body will give them any thing: neither are those wanting, who feign their Religions, change their garment, walk in woddish begging shooes; they by a lurking hypocrisie, counterfeit an Hermite, into whom God hath inspired the vertues of Simples. There are some also, who everywhere intermix Astronomy and Palmestry.

In the next place, there are others who wander about the countrey, who received their Art in the Mountain of *Venus*: from hence they have known to cure brute beasts, no less than men, from diseases: Likewise, they know also how to foretell things to come, and to dig treasures out of the earth: And there are some, who being destitute of books, write on paper the unharmlless words of *Solomon*, whereby diseases no otherwise than as Devils are chased away; they carry crosses before and behind them, lest the Devil should carry away him that writes those powerful words. There are some who understand divers Dialects; they feign among the *Dutch*, that they can speak the *Chaldean*, *Arabick*, and *Dalmatian* or *Sclavonian* tongue, and being laden with many Arts, they at length, brag

brag of Science Mathematical, or Histories: Many of these have known how to make, no less then the stone which makes gold, they carry about with them Mines of Mettals, that are propagable by a perpetual ferment. There are also *Saracens*; and there are baptized *Jews* (for the most part, wickeder than those that are not baptized,) who have learned out of the *Cabal*, divers wayes to mortifie *Mercury*; and likewise diversly to prepare poysons: the which, they deliver, to be prevalent against all diseases, and many other. They boast, that the *Hebrew* tongue doth contain the foundations of all Sciences, and the great Secrets of Common-wealths; and that they are great with child of the fore-knowledge of future things. They oftentimes cite their *Rabbins*, their book *Nebala*, together, with the little Key of *Solomon*: from whence they are able to read as well things past, as things to come. Others also affirm, that the medicinal Art is to be inherited only in their own progeny or succession of blood; although they are all foolish, or wicked persons. But if they are not received by men, at leastwise, among women they boast with a Grace: for they are covered with the same hide, both *Greeks* and *Jewes*, although the one doth interchangeably deride the other; for they being prompt by nature, perfectly learn to Lie, of themselves.

There is also a fugitive sort of the family of Chymists; the which, while they boast of the more choice remedies, set to sale nothing but poysons to Apothecaries: for they usurp all liberty of lying among the ignorant; lying increasing with them through daily use. For they are Idiots, being fugitive Apostates from Chymical furnaces. But the *Schools*, do with a greater security, and by a most free authority of all, deceive Mortals: for when as I do by the unavoidable decree of truth, demonstrate, that they are altogether ignorant of the essences, causes, and remedies of Diseases, and do confirm that thing by a great Volumn, and Reasons drawn from the cause: they in the mean time, promote their own Schollars; this man, because he is a Latinist, and hath his father a Chyrurgion, or an Apothecary; or another, because he was made Master of Arts, and hath heard some Lectures of Professours; another lastly, because he in part, brags of *Euclide*, or or hath learned to dispute, from *Aristotle*.

But I pity mankind, which is subject to so many inward Calamities, and exposed to so many external assailants: who, when under the unlucky rules of the Schools, they have slain any one of those in chief Place, do assume the priviledge of calling upon the incurableness of the disease, and have everywhere their patrons and complices. And so, they alone, do without punishment, make an assault on the lives of Princes, even as I have shewed in the book of Fevers. But by so much the more miserably, do mortals entrust themselves in their hands, because they cover their ignorance among the common people, by promotion, and an oath. For they swear that they will faithfully cure infirmities, the which, I have shewn, that they are altogether ignorant of. Yea, their Prince, *Galen*, hath not shewn them so much as one Medicine, which was not borrowed from Empericks, however he may triumph in his pastime Theory of Complexions and Degrees, as well according to their kinds, as places. For *Quintius*, the Master of *Galen*, and wholly an Emperick, is everywhere called on for help, by his Schollars.

Princes and Magistrates ought to divert this unpunished liberty of killing, from their Subjects, and they are held from Conscience so to do. But I do not think, that this hath been neglected through carelessness: but that it hath hitherto been disregarded, by reason of the ignorance of the remedy. But I judge this to be the remedy thereof: If they appoint every Physician to be so obliged, as that he ought to go to see every sick person, by whom he shall be required, three times at least, under the penalty of banishment, and deprivation of his office. For otherwise, the number of Physicians, hath sufficiently increased. And then, that there be no pay due to a Physician, if he shall not heal the sick. By this double decree, indeed, Physicians would become the more watchful, and the business would more rightly succeed with the sick, and the Prince would preserve his Subjects.

But those Statutes are to be seriously kept; for they are equivalent to the Law of *Cornelius*, concerning privy murderers. I now return from whence I have digressed. There are also some, who while they feign themselves to have read my Book of Fevers, object, that I boast only of Chymical Remedies, and unwonted *Arcanum's* or Secrets, that I might call every sick person unto my self, by despising the most safe doctrine of the Antients. Far be it! Because I neither go to visit the sick, nor do I heal for hope of gain: The which, all good men of our whole Countrey are witnesses of. Surely, I call none, to prostitute or set my Medicines to sale unto them. I willingly live a retired life, being sought unto only by the poor. This one thing, I openly and freely profess: to wit,

U u u u u

that

that the conquests of difficult diseases, do require other *Physicians* than *Humourists*; and far different remedies from those which the Apothecary sells: Because they do most desirously require the endowed powers of the most perfect bodies, that their poysons, from their ballames, may be separated in us. Yea where poysons are not manifest, the confusions of the *Archeus* are overcome, impurities are privily expelled, the Dimensions of remedies are turned in and out, that they may disclose their properties, of whose endeavour, the *Archeus* hath need.

And moreover, the impressions of remedies may be turned inward, whose Tyranny our nature cannot bear without destruction. For in this offence, and in this penury, many ages have already departed, as being unhappily passed over; because the causes which make diseases, being unknown, the powers of Remedies being not known, and the more profound preparations being despised, whatsoever disease did not pass under heathenish beginnings, hath stood dedicated unto desperate ones.

4 Truly, no Disease is, in its kind, incurable: For God, as he made not death, so neither doth he rejoyce in the destruction of the living. He hath made the Nations of the earth curable: neither is there a Medicine of destruction, nor a kingdome of infernals in the earth.

5 Wherefore, I before God, who is everywhere present, do from my very soul, exhort a sluggish kind of men, who are ready in subscribing to the ignorant, that they contemplate with me, that by the remedies of the Shops, some diseases alimentary or pertaining to nourishment, are sometimes by accident, cured; to wit, such as do admit of voluntary consumptions, and easie resolutions: But that in the more grievous ones, in whom there are fixed, or Chronical roots, the use of those have more hurted than profited. *Hippocrates* indeed, without envy, left the enquiries into the more profound remedies, unto posterity: because our Ancestours lived in more happy ages. But the Schools have not had respect unto the greater necessities of Mortals, of nature fitting and laying; but being content with *Galen*, and his Master *Quintius*, they have not perceived the defects of mortal men, seeing they have beheld gain to sway them in any event whatsoever. For they have not so much as once earnestly considered, how to hinder the returns of the stone in the kidneys, and much less, how to dissolve the stone; because they had yielded up their names to deceived Authors, and false causes. For therefore there hath nothing been heard hitherto, of the true cause of stones, and of a true cure, and therefore also, nothing of true remedies.

9 For truly, such a remedy was desired, which might hinder the Off-spring of a growing *Duelech* to come, by a preparation of the very urine it self: Then also, which might restore the Gorgonous declining of the stone-breeding womb, the power of a stonifying ferment; and at length, which might also dissolve whatsoever the spirit, the Coagulator had committed. Of all which particulars, there hath nothing been hitherto heard: Only the Schools have been intent in driving the stone forward, and in loosening of the urine passages.

7 Therefore, in curing of the disease of the Stone, a two-fold industry is obvious to our sight: To wit, one, which takes away the inclination and fear of a Relapse: But the other which may demolish *Duelech* being generated. I will shew, that it hath not been dreamed of either intention, in the Schools; but only, that they have attempted the driving forth of sands & stones; but that they have not considered of the pacifying of so cruel a pain, from the root. They praise indeed, and exalt to the highest pitch, Mallows, the *Marsh-Mallow*, Oyl of *Almonds*, and whatsoever things they name moisteners for mollifying: and then, they con-joyn divers fomentations, as well those, moistening, as absterfive or cleansing, and likewise cooling ones, lest the pains should be heightened, or the stones increase. Yea, they commend also, the Oyl of *Scorpions*; as though, that being anointed on the out-side, would break the stones! as if I say, they would loosen the fat, fleshy membrane, and *Peritoneum* or filme enclosing the bowels; to wit, at the enlargement whereof, the urine-pipe should presently be mollified, and extended in breath or wideness. Truly the common people have found out, and brought forth these succours for themselves, some old woman at first perswading them.

8 Afterwards, the Schools, at the beginning, admired these succours, and then, straight-way embraced them: To wit, least (since they have no other medicine) they should become unprofitable by despising them. But these things are not received for the sake of pain alone; but they lightly searching into the cause of help, and being only solicitous about the journey of the stone, have decreed with a final arrest; that the urine vessels are not to be enlarged but by moistening things; neither that there could be any other

other hope of healing : But for the enlargement of the urine-pipe ; not indeed according to its length ; but only , whereby they might hope , to wit , for its widening : as if nature were obliged to conform her self to the endeavours of *Physicians* : And so they have judged the remedies of pains to be by accident ; whereunto they have adjoyned Clysters, lest the urine-pipe being pressed together by the dung lying upon it, should spread a floud-gate for the sliding stone , and so , should stop up its passage ; And so that the capital remedy of the Schools hath been intent about dungs, the effect, and latter symptoms ; but no way on the causes, rootes and foundations : From whence that Satyrical verse arose.

Stercus & Urina, Medicorum fercula prima.

*Excrementitious Dung and Urine-piss,
Are of Physicians, the chief dainty dish.*

But how vain and childish these aids of the Schools are , the very afflicted themselves, and the widows and off-spring of these, do testifie. First of all, the Muscilages of the Mallow, do not pass thorow, from the mouth unto the Ureter, in the form of an asswaging , loosening and mollifying Medicine but that, they do first receive some formal transmutations in their passage : For neither doth any thing descend thither , unless it hath first assumed the nature of urine : Yea, and if the urine-pipe being now stopped up by the stone, (for as long as it is not stopped up, it hath not as yet filled up the whole wideness of the Ureter , and therefore an enlargement of the same should be in vain required) doth sustain the urine lying behind it ; after what sort, I pray , shall this same excrement give place in so straight a passage, that it may rise up, and make room for the urine prepared of the Mallow, coming unto it ?

I, at leastwise, confess, that I do not understand any thing of these promises. And then, put the case, that old wive's fiction were granted , and that, that moistening Muscilage could come down safe unto that straight angiport or narrow lane of the urine : yet it shall not therefore extend the pipe of the Ureter, which was already before, moist ; the which , besides the already actual moistening of it self, doth now require or expect to be enlarged by a forreign muckiness : as neither, being once ever enlarged, should it afterwards wish for, or admit of a further repeated extension of it self, in relapses ; And so, that supposed, and dissembled remedy of the Schools , would be profitable but at only turn : Unless they had rather, that the Ureter should be enlarged by the sliding and coming of the aforesaid Muscilages thereto , and through their casual absence to be again narrowed into its former state ; which is to grant a power of enlarging according to the desire of the Physician, besides the accustomedness and nature of a solid passage , and that of the first constitution: Because they should naturally, afterwards again return into their former and native narrowness. For the Schools, if they speak seriously in these things, they beseech or deride the sick, and do wantonize by applauding of themselves.

I pray you, if they suppose these things to be true , why do they forbid Diureticks, if they are of validity for driving forth of the stone, and by administering moisteners, do enlarge the narrow passages ? Why do they not couple moisteners with provokers of urine, that they may satisfie both betokenings at once ? For I have already taught before, that if death shall come upon the Patient, from the stone sticking in the passage, that doth not happen from the guilt of Diuretick Medicines; as neither because the urine vessel (unless perhaps , it shall be a monstrous one) is in some other place, straighter than it self in its beginning; and therefore that the stone once departing out of the kidney, if it be stayed in the sliding down by reason of the strickness of the passages ; that happens from the cruelty of pain which hath convulsively contracted the urine-pipe : And therefore, that comes not to pass through the offence of the Diureticks , but of the Physician, who hath never scarce heard of this Convulsion, in the Schools ; and therefore, neither hath he sought into a remedy for it. Where surely the incongruity , and faulty arguing of the Schools, from not the cause, as for the cause, comes to be taken notice of.

Because the aforesaid moisteners , the Marsh-mallow, mallow, and oyle of *Almonds* , &c. Do profit , not as they do enlarge the urine-pipes (which is in it self ridiculous) but forasmuch as they assuage the convulsion of frizzling, even as some external fomentations do. And likewise, the juice of Citron, doth not helpe by the absterfive, and in-

cisive or cutting force of its sharpnesse (for otherwise, vinegar, and other sharp things should perform the same) because the juice of Citron, layes aside its tartnesse in the first digestion of heat, and therefore, neither is it admixed with victualls, now waxing hot: but there remaines in it a residing faculty, convenient for asswaging of the Cramp or convulsion: To wit, while it being converted into urine, doth as yet retain a certaine kind of marke of its former middle life.

11 What if the *Schooles* do fear the use of *Diureticks*, least happily, many stones in descending, should light at once within the Ureter, and that he which as being the more grosse one, was the hindermost, should as it were a wedge, stop up the passage: But, neither so indeed, is there a casual vice to be ascribed to the *Diuretik* medicine: Because, besides, a fiction is also set to sale for a truth; For whatsoever doth at the beginning, happen to fall into the urine-pipe (unlesse it shall be a certaine hook) that doth thus procede, and is carried downwards: For smal stones do not play and wantonize in so famous a passage: not one stone, or many at once that are bigger than the passage, do passe out of the kidney: as neither do they once fall down from thence, which sustain the weight of urine behind them. That thing indeed, were to be suspected, if the Ureter were not a soft and loose membrane, but a dry and unflexible reed: For that, a moist membrane, for fear of a *Vacuum* or emptinesse, doth of necessity alwayes fall down on the sides, unlesse it be enlarged from behind, by the urine falling: But the urine provoking medicine, is not yet therefore hurtfull. For the falling of many and badly formed little stones by chance into the Ureter, hath not drawn its faults from the diuretick remedy; but from the fatal urine rushing on it, which without that *Diuretick*, had equally fallen: wherefore a *Diuretical* remedy is neither to be feared, or turned away from, for fear of an irregular and monstrous chance: to wit, that, that which is ordinary, by it self profitable, should be forbidden, from the fear of an unwonted and most seldome accident. But if they say, that many smal stones being glewed together with a slimy matter, do fall out: First of all, that destroies the material cause of *Duelech* which is diligently taught by the *Schooles*. For truly that phlegmy glew ought already to have been stonified: but those stones neither found, nor took to them, that glew in the urine-pipe: wherefore if one only stone, or many co-glewed ones, do slide out of the kidney, it is all one: because in their sliding forth, they were not bigger than the passage of the kidney.

Therefore if urine-provokers do not dissolve that glew, nor disjoine those little stones: it shall atleast be very profitable, so much as may be, to have driven forth that offensive fardle of the stone, a more plentifull and provoked urine laying on it, by the urine its own weight. For the urine-pipe is not naturally moist with any muscilage within; The which, the urines of healthy persons doe testifie: Therefore, if any muscilage of medicines should come down thither, that could not but be unto the Ureter besides nature, and its usual wont. What if the urine pipe, being beset with a stone cast into it, be said to beget a muscilage.

First of all, the urines of those that have the stone in the reins, do contradict that chance: And then also, the *Schooles* shall be heedlesse, which derive phlegme, or the material cause of the stone, from above, yea, out of the stomach, for stones: because it is that which should be found at hand, and in the sick ureter. And foolish muscilages of forreign simples are given to drink, if a muscilage should be the native cause of the malady. And then, the *Schooles* speak, as if *Diureticks* did drive forward the stone, yea and also the urine as with a hammer, or as if they did thrust them forward behind their back, as by a staffe: for so, by artificial things, after the manner of the vulgar, they plunge themselves into a labarinth for a spectacle: Not considering, that in urine-provoking remedies, there is a specifical property left from the middle life of the simple, or got in the transchanging of digestion; from which property; *Diureticks* do emunge or wipe out the urine. But no *Diureticks* do by themselves respect the progeny of the stone; As neither doth an honest or true Physician give heed to effects that rush on the sick accidentally by accident, that therefore, he should neglect effects, *per se*, or by themselves; the which notwithstanding is otherwise done, by forbidding of a urine-provoking medicine. Because that a sanative indication, or healing betokening, commands a most ready removal of that which is hurtfull, and the rather, of that which doth afterwards wax more great by delay. Therefore I prayse *Diuretical* remedies in the stone of the kidneys, so that they do also aswage and lull asleep the convulsion. A certain Countesse, and likewise another Nun, closed their day with huge pain: For both of them shewed as it were, a hook, wth one sharp top of its Triangle ending in the kidney; but

but with its other, into the *Ureter*: and both of them dyed with a cruel Convulsion. They dye not indeed by reason of the suppressing of their urine, when as the other of their Kidneys, yielded a sufficiency of urine: but they dye onely through a cruel Convulsion; which Cramp is again loosened about the time of Death: Wherefore the Dissection presented nothing besides a small stone of a Hook-like form, which brought death upon them.

I said at the beginning, that the curing of *Duelech* did consist as well in the abolishment of the inclination, as in the melting or dissolving of the stone; both whereof, the *Schools* deny to be possible: and so we stand in opposite termes. Therefore we must come unto Reasons, unto Witnesses or Deeds, and unto Charters or Letters Patents; and that, my Right being proved, the ignorances of the *Schools* also may be made manifest.

First of all, Seeing that of a Non-being, or of that which is impossible to be, there is not any positive Conception, and so, neither is there any knowledge thereof; Therefore the *Schools* confess, that there can be no Science or knowledge unto them: and that they do deny those things to be possible, which they confesse themselves to be ignorant of.

But the Reasons, which have dashed the *Schools* unto an impossibility, are these; but frivolous enough. Our Experience, the Mistress of things, hath not yet made it manifest unto us, that the evil inclination can be taken away; since that according to *Galen*, a Distemper being turn'd into a Nature, cannot be cured, according to the Pro-
verbe

Naturam expellas furca, tamen usq; recurret

*Though Nature with a Fork thou dost expell,
Yet still she will return into her Cell.*

But most especially, in the part that is filled with a continual Excrement, to take away the confirmed distemper, is altogether impossible. But as to the Stone being confirmed, however great a noyse the specious boasting of *Stone-breaks* may make, yet it is nothing but the vain Boasting of *Empericks*; The braggings of *Idiotisme*, and nothing else. For the *Physitian* can onely stir and drive forth the stone by Urine-provokers, and loosen the passages by moistening Emollients: Yea, since *Diuretick* Medicines are full of danger, nothing is more meet for a *Physitian* to do in the Disease of the stone, than to enlarge the Urine-pipes by moistening them, and to take away the incumbent filths by Clysters, from the Bowels: but the smooke-felling *Chymists*, boast that they will dissolve the stone being confirmed in the Bladder, by a Retrograde Resolution; and so they procure nothing but disgrace to themselves from their own mouth: But our Philosophy promiseth nothing beyond the strength of Nature, and therefore it remains Reverenced among Learned men, and hath taken firm Root for so many Ages already past. For who sees not, that the stomach it self ought of necessity to be sooner broken to pieces and dissolved, than the stone which is an hundred times harder than the stomach, being so far remote from the mouth? But because the Chymist is for the most part ignorant of Philosophy, he boldly promiseth any thing, that he may wipe Moneys from the miserable and credulous sick; The which, he knows not how to provide by his Gold-making Art. For if there could be any thing in Nature, which would dissolve a confirmed *Duelech*, so many Princes and Peers, and so many various Wits of *Physitians*, had not hitherto wanted so happy a Remedy.

These are the lofty Looks, Decrees, and Calumnies of the *Schools*: The which notwithstanding being well weighed, are found to be the true priviledges of opposite men.

For first of all, if any one by offending, may contract a Disease; Why, by a well-healing, may he not take away the same radically? and wholly Root out the Characters that were once imprinted on the part? For I have freed many from the Disease of the stone, to the which they had for some yeates been obedient, so as that they lived for the future, plainly free there-from. The Remedies of whom, thou shalt by and by find, under the penalty of my infamy or disgrace. For I easily indulge the *Schools*, because they speak according to their own experiences, and ignorances of the Causes, and deny that the Impression translated on the powers of the Members, is to be taken away: To wit, seeing they hitherto acknowledge, nothing but raw and sluggish Remedies: But in the mean time, they are wallowed in an unexcusable Errour, who despair that any one should be wise beyond themselves: When as in the mean time, they cease diligently to search, and all their life long, addict themselves onely to Gain. The Judgements of

the *Schools* have regard unto the Writings of Ancestours who were subscribers to Hea-thenism: but our Judgements have respect unto the first Being of Bodies they being freed or dispatched from their Wrapperies, whereby they are hindered from proceeding unto the first Constitutives of us: wherein they are able to strangle the hurtfull Impressions which are introduced into the middle Life; and for that cause to take away those Impressions which seem to be converted into a Nature. As to the taking away of the inclination; first of all the Medicine *Aroph* of *Paracelsus* (which sounds, as the *Aroma* or *sweet Spice* of the *Philosophers*; so called by reason of its Golden Tincture) being prepared under Dung, with the mixture of *Rye-bread*, and afterwards extracted with spirit of Wine, cures an antient inclination unto the stone of the Kidneys.

A certain man called *Baio*, our Countryman, while as he had for some yeares in his Embassage into *England*, been many times molested with the stone in his Kidneys, with the greatest pain, and through my perswasion, making use of the aforesaid Liquor *Aroph* twice every week, was afterwards free from that affect of the stone for the space of eighteen yeares: and at length dyes in the 83 year of his age; and his dead Carcase being dissected, shewed not so much as a small sand or little stone; who before, while he was stony, whether he were carried in a *Coach*, or soberly walking, had alwayes pissed bloody urine: His Heires do now as yet survive, who are witnesses hereof.

I remember also the Counsellours, of whom I before made mention, concerning his eating of *Asparagus*; For he, when he was wont miserably to lay down at every fifteen dayes, having afterwards used Ale wherein *Daucus* or wild *Carrot-seed* was boyled, hath lived now, for some yeares, free from the Disease of the stone. The Experiments and Testimonies of whom, do make the *Schools* to blush: Since there is Truth in their mouth. *Paracelsus* also called the Beings of *Gemms* and *Stone-breaks* unto his ayd; and at length, by the one onely Remedy of *Ludus*, promiseth, and attained both the ends of Curing. The *Schools* Deny that to be possible, which they cannot perform: their Testimony is full of arrogancy and blockishnesse: For truly, as oft as they admire at the feeble help of *Stone-breaking* things, attempted with their crude Remedies, and also their vain effect thereof, they bend their Brows, lift up their Shoulders as astonished, being asked, are silent; but being constrained, flye back to an impossibility, and had rather accuse God, as having forgotten Mercy and Goodnesse, than that he had afforded Remedies in Nature against the stone; being (as they say) confirmed, and against most Diseases: Yea, they do more willingly accuse God of forgetfulness, than they themselves can admit of the mark of any ignorance in their own Paganish Doctrine. But Princes being circumvented by the *Schools*, have subscribed to the juggling deceits of these; and they being seduced by the Impostures of the *Schools*, the liberality of their Piety hath erected Hospitals of incurable sick: which Impostures have reproved that Text of Wisdome of a Lye; 'God hath made all Nations of the earth curable: neither is there a Medicine of destruction.' For the *Schools* have made their own and too gross ignorance, reciprocal and convertible with the imporency of Nature, as if they knew every thing that is possible, and were ignorant onely of that which were impossible: and that not onely Negatively, but altogether privatively: As though their ignorance did not depend on the defect of Universities; but rather on the scantinesse of Divine Goodnesse, or Providence. Wherefore since a denial of possibility in healing, seemed to me to contain a hidden wickednesse, I alwayes hoping well even from my youth, did argue on the contrary, after this manner. If it be of Faith, that every Disease began from the Fall or departing out of the Right way; but that every sin may be wholly remitted: we must by all meanes hope, that every Disease may in its own kind be taken away, if the punishment be equalized with the sin, in Remission: Especially, because the same God who forgiveth sins, doth also heal Diseases, hath afforded Remedies, and hath created the *Physician* through the abundance of his Goodnesse, which exceedeth all his Actions: and is infinitely greater in his Indulgence, than all the sins of men. For could he not perhaps, create a suitable and victorious Remedy for every Disease? Or knew he not how to do it? Or was he unwilling so to do? Who hath afforded the Remedy of Eternal Death. For he rejoyceth not in the destruction of the living, who hath made all Nations of the Earth curable. But as to the authorities of Writers: For *Cardanus* writeth, that in his Age, there wandred a man about among the *Lombards*, who in a few dayes, by a certain Cup, cured in many places safely, certainly, and briefly, as many as had the stone in their Bladder: and he adds his Judgement, that he doubted not, but that this man was in Hell; because dying, he envied his Art unto mortals. In so great a Paradox, one onely witness is not sufficient against the Clamours of the *Schools*. The Epitaph

raph of *Theophrastus Paracelsus*, which is seen in a wall in an Hospital, nigh Saint *Sebastians* Temple, being erected by the Prelate of *Saltzburge*, doth represent the same wonder to have many times happened, however the Guts of the scoffing *Momus* may crack. His words run thus;

Here lyes Entombed, Philippus Aureolus Paracelsus, a famous Doctor of Medicine, who by his Wonder-working Art, took away those cruel wounds, the Leprosie, Gout, Dropie, and other uncurable contagions of the Body; and honoured his Goods, so as to be distributed and disposed of to the Poor. In the Year of our Lord, 1541; on the 24th, day of September, he changed Life for Death.

But that under uncurable Diseases, the *Tubes* or *Consumption of the Lungs*, *Asthma*, *Stone*, and all such like Diseases were understood by the Prince of *Saltzburge*, the *Schools* themselves do teach. Because they are those who do alwayes Thunder out, *That such Diseases are every where, chiefly uncurable*: And then, the indefinite phrase of the Epitaph hath respect unto the Books published by *Paracelsus* concerning the *Stone*; and that with a far more accurate Quill, than concerning other Diseases. At leastwise therefore, whatsoever is once and the oftner done in Nature, it is not impossible that this should be done again: And by Consequence, whosoever affirmeth that to be impossible, which by divine Goodnesse was at sometime done in Nature, according to the desire of the *Physitian*, he lyes before God the Workman of Nature: For in the Right, which is of the deed done, those very Witnesses do disclose it; and those are reckoned unprofitable brawlings, which are brought in against Witnesses. The *Schools* therefore, which call us Deceivers, do mock mankind with an *Elenchus* or faulty Argument: saying, *The stone that is far remote from the mouth, is far harder than the membrane of the stomach: whatsoever therefore should corrode or lessen the stone, being at a far distance, had now a good while before consumed the stomach it self, whereinto it had newly fallen. Therefore the stone is of necessity, an uncurable evil.* But if the holy Scriptures write otherwise, a way is to be sought, whereby with moderation, they may be excused of falshood. But surely, the *Keyes of Wisdom* are by a certain force, so detained in the *Schools*, that seeing themselves enter not in, they also endeavour to drive away others that are willing to enter. For it is not in the intent of the *Chymist*, to take away *Duelech* by Corrosives, but by proper and specificall Dissolvers. For neither doth the stomach of a Pigeon dissolve Pearls, or that of an *Ostrich*, Iron, or Flints, by Corrosives, but by an appropriated Ferment of Digestion: Or if thou shalt grant Corrosives unto the stomach of Animals: at leastwise they are such, which bring not any damage to the stomach; And moreover, if thou hast regard unto the highest Corrosives, *Aqua fortis* dissolves indeed Iron, Brass, and Silver; but Wax, it doth not so much as pierce. Through the inconsiderateness of which thing, the *Schools* have affrighted their young Beginners, the unlearned vulgar; yea, and great men from diligent searching into things, their own ignorance, the drowsiness of diligent searching, and hope of Gain, perswading them hereunto. Therefore for the stone, and diseases in the Bladder, as if *Physitians* did intend a Derivation or drawing them another way, they being ridiculously converted unto the Fundament, have attempted the matter by Clysters; as if to have unloaded the Fundament, were to have purged out the stone.

For they saw, that the juyce of Citron did diminish a humane *Duelech* in a glass, and they hoped, that the same thing ought to be done in us: But if not, that they could boast, that by administering the juyce of Citron, they had performed as much as was possible for nature to do. As being ignorant in the first place, that the sharpness of the Citron doth wax sweet under heat, like an unripe apple, which in it self, is at first, sharp, and afterwards, being ripened by heat, becomes sweet.

In the next place, if one only drop of the more tart wine be sent inwardly unto the bladder, it brings more pain thereunto, than a great stone. They therefore imagine a ridiculous thing, who boast, that by administering the sharp juyce of Citron at the mouth, they have done some profitable thing for the diminishment of the stone. They likewise erre, who also hand forth liquors that are distilled with salts, for the dissolving of the stone in the bladder: for a sharp matter, as such, cannot pass thorow into the veins, without a notable hurt or damage. And although, in the juyce of Citron, and much more in the spirit of Sea-salt, there are succours for those that have the stone; yet these

do not happen unto them, unless they have first bid farewell to their tartness: Because in very deed, the curing or dissolving of *Dueteck*, is not perfected by sharp, as neither by corrosive things. Neither do sharp cups ever pierce unto the bladder, nor are suffered to be derived thither.

But while the Schools have been intente on the summary or content of stone-breaking Medicines, although as astonished, they were at first, fearful of the issue of what they promised, and afterwards being more assured, they saw themselves to be frustrated of their hope; yet sporting with mans skin, they gave him the beaten powders of fruits and stones. They knew, I say, that they were destitute of a remedy; yet they desisted not to give those things to drink, which they knew to be vain, wherein they deceived the sick, while they skipt over the occasion of healing, with vain and pastime remedies, that they might excuse themselves of their death, among posterity: as though they had faithfully administered whatsoever was possible in nature, and those things which are extolled by true Physicians. Of the more hard seeds (as while they gave credit to Grum-mel seed, so it is by a ridiculous name, called [*Lithospermum*] or stonie seed, by the Schools) they straight-way made to themselves a presage from their name. And then, they joyned the stones of Crabs, Snails, Fishes, also the burnt shells of shellfishes, yea, the hardest gemmes, being beaten in *Aurichalcum* or Copper. At length, they gave Chrystal, being fired, quenched, and beaten, to drink, from a pastime invention, and with a deluding event.

Last of all, as soon as they beheld themselves to have come into derision and despite, or least they might seem to expect a reward, and their repeated frequencies of visits to be undeservedly paid them, but to have done something, although they being perfectly instructed by manifold experiences, despaired within their own breasts: They said, that a succouring remedie, which was denied in *Europe* and *Asia*, was to be fetched out of the *Indies*; at leastwise, that the Councel of the Physician by the knowledge of so foreign Simples, might be drawn into an admiration by those that stand by: As if God were not the Creator of remedies, the merciful helper of the sick, and had for so many thousand years, refused remedies to the *European* and *Asian* sick?

But in the mean time, the stone doth of its own accord, rush head-long out of the kidney (for of that of the bladder, they have long since despaired) oh, of what great esteem are their stone-breaks so administered, then, made! and as somewhat too bold, they feign, that their powders do command the kidneys, no otherwise then as bond-slaves, and break the stones, as it were, under a hammer.

18 But if the business succeed the less prosperously, they grieve that they were called late, that the passages might have been more seasonably loosened by a Bath and a Clyster. They bewail that an offence was committed in the sewness of Clysters and Simples, and accuse their Cousin Physicians. They grieve most especially, that they were called, the stone being already confirmed; although for this cause, by reason of a charter or commission sent them from the Schools, which time between the stone being confirmed and not confirmed, might proceed, perhaps not indeed from the negligence of the Schools: but because that Charter being written in parchment, was devoured by the mice.

19 Truly, a privy shift of the Schools it is, being a like ridiculous! For truly, *Dueteck* doth not obtain his hardness by degrees; because he is hardened by his own *Coagulum* or runnet, in the middle of the waters. And therefore the Schools have been deluded, who thought, that the stone was hardened and dried by degrees. Surely he is as hard in his yesterdays bark, as in his innermost kernel; and as hard, being newly cut out and wet, as he will be, being kept for a whole age after. And the sand is as hard, which but newly adheres to the urinal, as it will be within a year, being scraped of. A flint, I say, is as hard in the bottom of a river, as it will be within an hundred years.

Who is there therefore, who may not admire with me, the everywhere gross ignorance of the Schools? They have not only deceived themselves by their own thinking, for that they have said, the stone in the bladder is generated, dried, and by degrees more hardened and confirmed through heat; but they have not so much as considered by the way, that urine doth apply sands in the glass, and in the cold of the encompassing air, without the help of heat, dryth, or cocture; it being as hard to day, as it will be after that it is dried in a paper.

These indeed are the Studies, Decrees, and Remedies of the Schools; by the worthy deeds whereof, they deny a help to be possible in nature, for those that have the stone: And therefore they decree, that the stone in the bladder, which is bigger than the passage, hath not a remedie in nature, from the divine goodness, besides the knife. For the bladder

bladder of women may be enlarged by operation with the womb-glass, and send forth its stone; but we now treat of the bladder of a man.

Horatius Augenius a chief *Paduan*, rejoiceth, that the cruelty of the knife was also increased by his own brain; to wit, because he first had dictated that wickedness to be done by a fired knife: But *Paracelsus* his junior, although he had also referred the whole hope of *Duelech* on the knife; yet afterwards having silenced his errour, repaired by his *Ludus*, his marble and flinty *Tartars*, equally, with other shellie or brickie bodies, resolving them by that one only remedie. Truly I know that divine goodness hath created stones in the Vegeraland Animal Family, which should be unprofitable and vain in their own particular kinds, almost monstrous, yea otherwise burdensome to their own individuals, unless they were created for some good unto us.

Therefore since all things were created for the use of ungrateful man, and many things do scarce profit their own individuals, they shall also scarce profit mortal men, unless being resolved into a milky juyce, or into their first Being; certainly they have received their appointments unto a strange stonification of a rocky form, from their use: for neither is a stone bred in an Animal or Plant, for a punishment, but it shews the signature of its gift, even in the hardness of its coagulation: But although a Mineral stone that is a stone-break, be fit for dissolving of *Duelech*, if it be so prepared, that it may come thorow unto the kidneys without the hurting of its faculties, yet the stone of the Animal or Vegetable, in their rocky nature, are for the most part, the more civil ones, and so being as it were household Citizens, they are the more easily admitted into our Common-wealth: for their countenance do cause a hope of their Signate: that as oft as they depart from their stony disposition, they also obtain a power of executing the natural endowments promised in their Signate, they enter into Wedlock with us, and communicate their intimately espoused, promised vertues unto us.

The which cannot happen, but by a full resolving of them into their first Being: For I have made the stones of fruits, to wit, of Medlars, Dates, Peaches, &c. Volatile, without any *Caput mortuum* or dead head, after that they had returned into a milkie juyce: And that indeed, without a separative distillation: For I have found, that this kind of remedy doth restore, no otherwise than as *Aroph* doth preserve: Of which two, I make this difference; that restauration is the cutting off of the received inclination: but preservation is a prevention of that which is to come through a hinderance of the disposeable matter: But in a true cure, both are included.

Furthermore, for the true resolution and melting of *Duelech* being generated, the *Ludus* of *Paracelsus* obtaineth the Chiefdom, nor that it is a flint, and that children do play with it; even as some have interpreted the Etymologie thereof: But because *Ludus* is alwayes extracted in the form of the ancle, of a die, or square cube: of the preparation whereof, this is the description according to the Author.

Ludus being exactly beaten or pounded, calcined, and boyled even into the form of an oyl; the which, he by almost one only word, calleth the Gawl of the earth, and a corrected *Alkoholizoi*, which soundeth *al. tho. oli. gesotten*, or that which is wholly converted into an oyl by boyling. Which most eminent preparation of *Ludus*, hath hitherto been made known but to a few Mortals, under that brief Tract of words.

And although the world be worthy of Compassion, and that its preparation may in a more manifest sense be described; yet the manifold Contemners of secret things are unworthy, that those things should be manifested now, which God for most weighty reasons, would have to remain among a few, and the little ones of this world, in the possession of the treasures of his own dispensation, until that nothing be hidden, which shall not be revealed in its own fulness of dayes: in which fulness of time, Wo to the world, and to its confusion!

Yet will I speak a little plainer, that those only, who are skilful in the Philosophy of the art of the fire, may comprehend me. Let *Ludus* be beaten into a powder, in a Morter, and under a Pestil: And then again under a Whetstone, in a stonie or marble morter: Then afterwards let it be calcined; not indeed with a roasting fire; but let there be added unto it, the Circulated salt, whereof *Paracelsus* speaks in his book of renewing and restoring, and the salt being distilled from thence, is called *Ludus Calcined*: Because with the small labour of two houres, it will be wholly converted into a salt. Let *Ludus* therefore, being thus calcined, and reduced into a salt, and being of equal weight with it self, run down of its own free accord into a moist place.

But let that salt being resolved, be shut up with *Hermes Seal*, in an Egg with a long neck, and let it continually boyl in Sand, with a fire of the second degree, untill that all

X x x x x

the

the *Ludus*, shall in its own equal weight, stand like a more gross Oyl upon the water, which it drew from the ayr of the Cellar: For then all the *Ludus* is a volatile salt, in the form of an oylie salt dissolved, and it hath a certain kind of tast of urine; and therefore it goeth through the urine with the drink, in its entire vertues, and dissolves every stone wheresoever it shall lurk in the Body; because it is a volatile salt, it is resolved in moisture, neither is separated in the shops of Digestions: But because it doth after some sort represent the tast of urine, and in the mean time, hath properties that are friendly to our nature, it is willingly received, and is also dismissed to the Kidneys. The dose thereof, is of 14 grains unto 20. with a small quantity of simple distilled-water: And the stone of an indifferent or reasonable bignesse in the Bladder, is resolved into the bignesse of a Pine-kernel, especially in two weeks. The liquor of *Ludus* being thus prepared, is called by *Paracelsus*, the *Gawl of the Earth*: because, if it be extended in paper, it is of a dark Citron-colour, not a little declining to green: For it is a stone, exceeding wonderfull, it onely answering to the descriptions of *Paracelsus*, to wit, being bred of the salt of the urine of the Liquors of the Earth: In the bottom of the earth, according to the depth of the bladder in the Body of man. But I have found it at the bank of the River Scalds, nigh *Antwerp*, where Bricks are boyled, and it is situated more or lesse than 40 foot under the Horizon, according to the depth of the River: For I compare, the bottom of the River unto the bottom of the Bladder: But it is not in the bottom of the River; but it is extended in one onely and simple roof or story, under the ground or bottom of the brim, in a neighbouring field, nigh to the sides of the Banks, and that for some miles. And that Vault or story of *Ludus*, doth scarce exceed the thicknesse of a foot. Neither also, is it any further extended above or beneath the aforesaid Vault; nor is it elsewhere round about to be found.

There is also in the aforesaid Field, a frequent *Fire-stone*, being rich in *sulphur* and *vitriol*. The which, although it be very hard under the earth, yet it soon becomes bricke under the ayr; to wit, through its *vitriol* decaying by degrees: But *Ludas* is a palish stone, now and then covered with a clear crust throughout its seams, being as to a great part of it, volatile in the *Potters* Furnace: For this stone is the top of Stone-breaks, and the desire of those that have the stone. Happy is he who can calcine the same as I have now admonished: But the labour thereof, requires not onely reading and thinking, but a full knowledge, being also doubly confirmed: Because it is the labour of Wisdome, the hope of *Adeptists*: Therefore he is most Rare, whom God, in this Age that is full of misery, hath thoroughly brought unto this Scope. It is not sufficient to have known the *Ludus* or *Cevilla* of *Paracelsus*, and the native birth thereof, and that it ought to be reduced into an oylie volatile Salt, without the loss or destruction of its natural Endowments: But since there is not a more laboursome part in all Chymistry (which *Paracelsus* doth often declare in the preparation of the Tincture of *Sulphur*, which graduates or heightens the native colour of Gemms: to wit, the same circulated Salt, is on both sides silently suppressed:) I will-perswade a few things, so far as Brother may communicate to Brother. For although out of humane compassion and Charity, a Remedy against *Duilech* ought to be divulged before the World, by Trumpets: Yet it ought, for Reasons known to God, to be kept amongst Secrets, whereof he himself would remain the Dispenser,

Take of *Ludus* being poudered: one pound, and as much of the Liquor *Alkabeft*; distill this Liquor from thence; and at the first turn, all the *Ludus* will be changed into a salt, which, in a Glasse-dish in a moist place, runs down or abroad, without any residing earthlinesse, and this defluxing Liquor, is of a yellow colour, and being closed up with a *Hermes* seal, in boyling, it swims wholly atop, as it were a froth, in the form of a green metled grease. And it is the corrected *Altholizoin* and gawl of the earth of *Paracelsus*.

But he that thinks, by the additament of *Salt-peter*, or of the like Artifices, to attain this Medicine; let him know, that such kind of salts, however exactly and repeately they are co-mixed with the *Ludus*, yet that the salts only will be defluxive, the earth being left, as it were a Lee or dreg in the dish: But the *Ludus* ought to be totally transchanged into a volatile ringed salt, without reserving any thing of the adjoynd *Alkabeft*: Because that as well this liquor, as the *Ludus*, do keep their former weight: And the *Ludus* it self, keeps the Mineral natural endowments which the Almighty goodness hath afforded it. But this work is most exceeding difficult, not indeed in respect of the preparation of the *Ludus*, but of the *Alkabeft* it self. I know that I speak the truth, and the proof thereof in our *Adeptists*, is that which exceeds all demonstration: For *A-*

Aristotle acknowledged no other Science, than that which springs from a fore-existing knowledge of the Senses: But there is another undemonstrable one, wherein the Giver himself remains the Interpreter of his own Light, beyond all the Ambush of a Syllogism; yet so certain is it, that the whole world cannot stir up the least doubt in the Knower: which thing I have professedly confirmed, and made manifest in the Treatise of the *Searching after Sciences*. I have made manifest the while, after what sort a spirit may be drawn out of putrified urine, which being sent into the bladder by an unpainful Catheter, dissolueth *Duelech*.

The Schools in the mean time commend their own Herbarists, and these their own stone-breaks; yet they are in doubt, and being without hope, contend with each other, That if not for the dissolved stone, at least, for the hope cast into the miserable diseased, they may desire a reward to be paid them.

There are some in the mean time, who promise composed Magistral, whereby the stone being beaten, as it were under an hammer or mill, is broken into a sand or meal: But if in the mean time, any sand doth perhaps appear, they require, that all that should be attributed to their stone-breaking remedy: but the event hath hitherto deluded their rashness, whom the knowledge of the root hath even hitherto deceived. For truly, *Duelech* consists of a matter altogether similar or alike, being fetched from the one only and constant liquor of the urine. For indeed, the stone is everywhere, and in every part thereof, a stone; neither doth the sand differ from the stone, by way of matter; neither is the Stone a manifold sand, collected by a glew or Muscilage; so that there is only required a resolution of the Glew, the sands in the mean time leaping asunder from each other: Therefore it is a frivolous thing, that the stone doth leap asunder into sands which are the more stubborn to dissolve.

For *Paracelsus*, although having obtained a remedy, he was successful in curing the stone; yet in this, he manifests, with the Humourists, that he was ignorant of the nature of *Duelech*; because he promiseth, that his remedy of *Ludus* being taken, it should be cast forth in the form of sands; Then again, because he teacheth, that the bigness of *Duelech* is to be divined of, and weighed, by the boyling and drying up of all the urines, being kept together throughout all the interval of the cure: Both whereof notwithstanding, is a meer dream of rashness: For truly, whatsoever remedy dissolved *Duelech*, that should chiefly, and far more easily be for the dissolving of sands, and very small fragments, if any should fall down: For whatsoever is coagulated from a similar urine, that also in it self, must needs be similar or alike: And then, if, when *Duelech* is dissolved by *Ludus*, all the urines being collected, and kept together in the whole interval of the cure, should be dried up; perhaps they would forty times exceed the weight of the stone: For who knows not, that even the urines of healthy folk, being dried, do leave a *Caput mortuum* behind them. Therefore I have discerned that *Paracelsus* indeed had often, by offering of his *Ludus*, dissolved the stone of the bladder; but that he kept not the strong smelling urines, nor likewise that he dried them; Because it had been too tedious a thing for him to do: For it hath pleased the most High to send before the *Elias* of Arts, a fore-runner, teaching the Crasis or constitutive temperature and preparation of medicines: unto whom, that the world might give credit, signes were given, establishing his doctrine: For he hath a famous preparation of great *Arcanum*, which was not to be confirmed but by an obtainment of healing: And then there have some followed after, who adding to the inventions of, or things found out by *Paracelsus*, were Illustrators of the Speculative truth being found.

That at length there may one succeed, who hath obtained the obtainment of healing, teaching both by word and work, those things which God hath denounced by the former.

Last of all, the Schools distrusting themselves, have by a new deceit obtained credit among those that are rash of belief; and have boasted, that by the rules of dyer, they have known so to dispose the body of him that is stony, that all the fore-going phlegmatick heap of the stone, and that which otherwise, without those their institutions, would presently and of its own accord, make for the branches of stone may by a continual successive repetition, be taken away: that is, they promise, that they can fore-snatch away all phlegm, which doth after any manner whatsoever, form the stone: Yea, that phlegm, which (according to the Heathens) is required for a necessary elementary composition of the venal blood, should be so sparing and small, that it should scarce suffice for that its necessity, and much, less for an abundance, to create the stone.

To which end they promise, to wit, certain Magistral, and repeated small Purges,

X x x x x 2

and

and therefore they name them Familiar, and minorative ones or those of the lesser sort.

They promise moreover, that they will shew to the eye, that truly dejected phlegm, (to wit, their Drawers out of phlegm or Phlegmagogalls being received to this purpose) hence also, they will ban themselves as for a speedy prosperous health (at leastwise a cloakative or dissembled one) to the sick, by reason of the foregoing matter of the stone being cast out: Nevertheless thus are the weak, by degrees, more weakened; they proceed to live medicinally and miserably, so long as they subject themselves as obedient unto such helpers

- 27 But it hath already before been sufficiently answered to such trifles, when as I removed phlegm and a muscilage from the number of the causes of *Duelech*. *Paracelsus* in like manner, doth alike unfavourably trifle about the first matter of *Tartar*, and of the stone, and being unmindful of his own Doctrine lately delivered, flees over unto the phlegmie muscilage of the Humourists, whom he first, notwithstanding, so named by a mocking name: But I, that very name being now everywhere received, do so name them from pity, but not from an Ironie or Scoff.

But *Paracelsus* being else where unwary, doth again oppose these things, promising, that within the fifteenth day of the curing of *Duelech*, it may be seen of what a bigness it was, if all the urine be daily dried up: which thing clearly infolds it self with the foregoing matter of *Tartar*, and such a drying of urine would be a meer deceit and juggle, if together with the dissolved *Duelech*, the foregoing matter of a stonie *Tartar* should be expurged: For truly he promiseth, that whatsoever dissolveth *Duelech*, that very thing doth much more briefly dissolve the foregoing matter of *Tartar*, which daily increaseth for the stone. I surely, have hated sluggishness and blockishness in healing, stubbornness in a learned man, ignorance in a Professor, a lye in a Writer, as also a contradiction in one seeking to compass the Chiefdome: For truly, all those things include a deceit and unskilfulness in the Teacher, if not malice besides, and an ignorant rashness in such a Prince; and so, they render all that religion or conscientious profession, suspected of much defilement. I at leastwise, even from my youth, have even unto tears, grieved at the condition of the weak or sick, who under uncertain hope, did as credulous, entrust their life, family, wife and children, yea their fortune and goods, to be governed by him that is a bold Boaster of any thing.

- 28 Therefore at first, I ran through the Monarchy of Vegetables: but I found not that which could dissolve *Duelech* in the Bladder; But whatsoever of those would make *Duelech* to melt in a Glasse, was either hostile, or at leastwise it came not with those qualities unto the Bladder; but if it might seem to be cast in by a Syringe, it was not by the Bladder to be endured. Therefore Vegetables being distilled and decocted; and likewise their ashes, *Calx's* or Limes, pouders, and all things being extracted, I learned but vain and slender Remedies against so great an Enemy. The more sharpe ones indeed did diminish *Duelech* in his entireness; but being taken in at the mouth, they entred not under that power unto the Bladder; but being cast in from without, however they seemed mild, like unto Wine, yet they imitated bright burning Iron in the sense of pain. Therefore I wondered at *Paracelsus* and others, that they commended Liquors distilled out of Honey, Sugar, Dew, &c. Since no mortal man ever endured those, being injected by a Syringe. Indeed, I have observed by experiment, that a Pigeon did dissolve *Duelech* being cut out of man, into a juyce, by the sharpe Ferment of her stomach, even as also the fragments of Bricks: Therefore the more inward membrane of the stomach of Pigeons and Hens was given to drink by Seniour *Physicians*, but surely with much deceitfull hope: As well, because the fermental power of the Bowels is extinguished together with the life of the Brute; as also it being granted, that that powder did preserve its primitive and antient faculty after death, which in life it obtained; yet that it should come unto the Bladder wholly spoiled of those virtues in the Kitchens of our Digestions: although in very deed, Pouders are scarce turned into a Urine-Latex. Although many things of that sort, are with a constant ignorance on both sides, prescribed to the sick.

Yet this I have learned, that the spirit of Spanish salt, being distilled with the utmost fire of a *Reverbery*, together with Potters-earth, and being drunk every morning with white Wine, which was the day before drawn out of the Vessel, takes away not onely the mortal stranguries of old people, and that it being wholly Diuretical, hath cured some: But moreover, in whom the Stone, which is bigger than is meet, falling down out of the Kidney, had stayed for some months in the Bladder, that it hath been at length diminished, and voyded out by pissing: the which notwithstanding, in its oftentimes repeated

repeated entrance into the neck of the Bladder, had been needfull to be before as often repulſed backwards by a *Catheter*. But it is prepared of that ſalt being firſt poured forth or ſpread abroad, and freed by the fire from its extravagant filth, and preſently, the ſalt being bruifed, and diſſolved between thin plates of Radish; and at length being again dried, and diſtilled with a like quantity of *Potters earth*, and at length with the ſharp fire of a *Reverbery*, and that after a due manner, that nothing expire or breath out of it, even as I will teach below concerning *Vitriol*. For thou haſt the Baſame of Salt, which thou ſhalt never ſufficiently eſteem. But in my Young Beginning, I had ſeen the old pieces of rubbiſh of ruinous Houſes, to pour out Salt-Peter: and that the powder of Bricks being once freed from the Salt-peter; and afterwards, being for ſome yeares kept under a Roof or Covering, did putrifie through continuance, and yielded Salt-peter afreſh, and ſo that the whole powder, except the ſand, might at length be turned into a ſalt.

I had ſeen alſo, a nitrous Brick, incloſed in the middle of a more broad Wall, to bring forth its own Salt-peter outwards, beyond all its neighbour ſtones, on both ſides; and ſo that it was the deſtroyer of its neighbour ſtones and Bricks. I therefore being mindfull of the name of (*Salt-peter*) knew, that that very ſalt was the Brick or ſtone it ſelf being reſolved: Eſpecially, becauſe it doth voluntarily drop down in the Caves of Rocks: but elſewhere, becauſe it hangs forth in long drops or Syckles. Wherefore I divers wayes prepared Salt-peter for the Diſeaſe of the ſtone, but in vain; Becauſe I was then, as yet ignorant, that *Duelech* conſiſted of far other principles, than Mineral ſtones did.

I ſaw likewiſe *Palmer-wormes* and *Inſects* that were bred in nitrous places, and which there abode, to be applyed for uſe againſt the ſtone of the Bladder; but in vain: But after that, I knew that ſo many Ages had dreamed in the knowledge of the Cauſes of the Diſeaſe of the ſtone, I confidently believed, that all the errour ſtood in the poſſeſſion of our ſluggiſhneſs.

At length, God taking pity on the anguiſhes of the Complainer, gave me the knowledge of the *Ludus*, together with the preparation of *Paracelfus*: they who underſtand me, do gratifie my publick ſtudies; becauſe they have known that I write the Truth. *Seek ye, my brethren, and huge joy ſhall meet your diligent Soul*. For firſt, learn ye to diſſolve *Duelech* in a Glaſs, with a lukewarm Liquor that is not troubleſome to the ſtomach, nor in the next place, unto the Bladder: ſo as that *Duelech* may be by degrees leſſened, without Bubbles and diſturbance: *Reioyce ye, becauſe ye are near*. Then learn to turn *Ludus* into a ſalt, without any remainder of the Tranſchanger.

But let Remedies againſt *Duelech*, be drunk on a faſting ſtomach, without a yeſterday 29 nights Supper; But if thou art fruſtrated of a happy Remedy, let an external one be injected every hour by a *Catheter*, yet the urine being firſt diminiſhed.

But while I examine that dropping of urine, the hiſtory of the Daughter of a Neighbour Baker returns into my mind. For he had a little Daughter, who would oftentimes piſs bloody urine, and her urine was ſuſpended by a middle thred: But it was pale, with much and a glewy ſediment; and thus ſhe had lived the ſeventh year of her age. A certain Woman of the Village, tells the Baker, that the ſame thing had in times paſt, befallen her. I had at length, the bladder of a Bull Calf, being an *Embryo*, not yet born, to be brought unto me: (for Cowes that are not begotten with young, are ſcarce fattened) That little Bladder is for the moſt part, filled with the Liquor, of the favour, not indeed of Urine, but of a ſtrange favour, whereof ſhe drinks every morning, about two ounces, with as much of white wine. She was afterwards married in the 10th. year of her age, and in this year 1643, ſhe is ſurviving and in health, being ignorant of the ſtone. The ſame Remedy afterwards helped ſome poor Girls. And when as this had been now divers times tryed, the ſame thing was tryed of the *Embryo* of an Hee-Goat, and it as yet more proſperouſly ſucceeded.

I will in this place, ſubjoyn my own Obſervations concerning the ſtones of Crabs, 31 which I never ſaw regiſtered by any other. Firſt of all, they are unfiſtly called their eyes, ſeeing they do not perform the office of eyes; neither do they hang forth, nor do they continue a full year: Neither laſtly, are theſe ſtones an eſſence extracted from the whole ſhell of the Bruit (although *Paracelfus* hath thus commanded it) for truly, by very many, and uniform diſſections of Crabs, have I for certainty found, thoſe things which follow.

Firſt of all, that the ſtomach of the Crab, is in his Head, nigh the Crown or top thereof. For the male-Crabs do every year begin to be ſick, from the middle of (the 14th. Month called) *June*: and then the females; in (the 5th. Month called) *July*, before the putting off of their ſhells: For they are for nine dayes ſpace, and more, as it were half without life and unmoved: In which ſeaſon, their ſtomack is outwardly over-co-

vered with a new little Membrane or film: between which, and their old stomach, there is a certain milky Liquor, which by degrees outwardly, on the boughty Globe of the stomach, in what part it toucheth on, and over-covereth the old stomach, is contracted in both sides into a hollownesse, and presently becomes stony. In the meantime, neither then, nor a long while after, doth the Crab eat up any thing: And therefore (it is almost incredible) his true, or more inward stomach is by degrees wasted away into a nourishable muscilage, and the other more outward and new stomach, succeedeth in the room of the consumed one. For truly, there is presently extended over that milk, grown unto the bought of the old stomach, a thin skin, after the manner that is wont to be over luke-warm milk, and that milk groweth between both the aforesid Membranes; To wit, of both the stomachs. All which things, I have daily observed, by dissecting of perhaps two hundred Crabs, with a pleasant admiration! At length the remaining part of the milk turns to the Crab for a nourishment. Last of all, also, both the stones on both sides, are again by degrees dissolved, and by little and little depart into nourishment: But the Crab eats nothing, nor is any thing found in his stomach, as long as those stones are in his stomach, and he liveth about 27 dayes, as well by his old stomach being wasted by degrees, as from the use of the stones being afterwards resolved.

- 33 I add, that a most Rare Diuretical or *Urine-provoking* Remedy is collected from this stone; also a vulnerary one, and a chaser away of Fevers, so it be resolved into the form of its former milk: The which, how excellent it is and powerfull, scarce any one but a skillfull person can be perswaded of: And there is nothing more fit for those that are wounded, or formothers after Child-birth, than the Remedy of these little stones. For it hath a Remedy against the disclencies of many Vegetables, that are infamous through a loosening faculty; so it be so resolved, that both of them may be mixed throughout their least parts.

Lastly, in the Marquedome of *Brandeburge*, there is a most plentiful fishing of Crabs: But the Carriers are constrained to watch by night; least happily some Swine do even but lightly run through under the Waggon: For if that shall happen, in the morning, as many Crabs as were in the Wain, are found dead: so destructive is the Hog to the Crab.

- 34 But that any thing may be cast into the Bladder without pain, I have invented a new *Catheter* or Squirr; Because the little silvered Horn, wherewith Chirurgians do with the greatest Torments, fetch out the urine, is cruel and bloody; and therefore it hath altogether displeased me: But among many which I have tried, that hath offer'd it self as the most fit, and as harmless, which was made of a thin hide of leather: for I bepainted this hide or dressed leather within, with a white colour of *Cerusse* and Line-seed oyl: and when it was now almost dry, forthwith I commanded a pipe to be composed by sewing, whereinto a brazen thred was driven throughout its length, and its seam was plaine, that it might not any thing stick out: But that at one end of this pipe, (the pipe it self being large enough) the pipe of a Syringe might be put into it as oft as one listeth, and that both might fitly answer, that this way the Liquor might be cast into the Bladder. Moreover, the whole Leathern pipe is confirmed with washy glew, that this being afterwards dried, it may be painted with a certain colour, and with Oyl of Line-seed; And that indeed, as well for the greater firmnesse of the pipe, as also, least it should be wet thorow, and wax flaggy through the Liquor that is to be injected. The Brazen thred therefore being drawn out, let another as its vicar, enter into its place, being prepared of Whale-bone. Thus therefore thou hast a thin flexible pipe, which doth not any thing pain in sending of it in, although it be forty times thrust forward into the Bladder, and in one only day. At the first turnes indeed, it pains about the muscle of the Bladder, as being unaccustomed thereunto: but the sore fear of the Contraction thereof soon ceaseth; but the urine is drawn away as oft as one listeth: And the Bladder being emptied, there is at length, cast even into the Bladder by a Syringe, being equally suited unto the pipe behind, whatsoever one will. Onely let the Liquor that is to be sent in, be unpainfull, nor unacceptable. But it is a Syringe unto whose pipe, I have said, that utmost end of the *Catheter* that hangs out, is to be fitly suited. Let praise Eternal be unto God in the Highest, and let it please him, to bedew, and make my services and desires fruitfull, which are offered for the help of mortals.

CHAP. VIII.

The Author offers a dainty Dish to young Beginners.

1. Questions of most learned men. 2. The Author's Answers. 3. The Author despiseth Judgements had, or to be had concerning him. 4. A satisfaction concerning Horizontal Gold. 5. Things of a different kind concerning the Sulphur of Venus or Copper. 6. That the Sulphur of Venus is not the innermost essence of a perfect metall. 7. A proof of a remaining external Sulphur. 8. The dignity of the Sulphur of Venus. 9. The Indistinction of the Authors of the Young Beginning of Chymistry. 10. The Authors Answers unto their Objections. 11. Some unknown things hitherto concerning Vitriol. 12. The name of Vitriol, whence it is. 13. The nativity of Vitriol. 14. The difference of the goodness of Vitriol. 15. The Greeks yield the Victory to the Germanes, concerning Minerals. 16. The error of Paracelsus about the estimation of Vitriol. 17. A demonstration of the aforesaid error. 18. What kind of Vitriol is the best for healing. 19. The best and unusual manner of distilling of Vitriol. 20. The wonderful properties of this spirit of Vitriol. 21. Some remarkable things redounding from thence. 22. The distillation of salts. 23. The commendation of Daucus or wild Carret seed. 24. Our Country wood for the stone of the reins, and the choice, and preparation thereof. 25. The use of the Birch-tree.

Through occasion of my Book, concerning Fevers, men of great note, wrote un-
 to me from divers coasts of Europe, desiring a clearing Comment about the reme-
 dies there delivered. They confesse indeed, that they acknowledge, in the boldness of
 my promise, the true remedies of any fevers whatsoever to subsist; but that they grieve
 at the too much obscurity of my writing.

First therefore, they enquire, what *Horizontal* gold may be?

Secondly, They desire the making or composing of the Element of the fire of Venus
 or Copper?

Thirdly, Whether or no that may not perhaps be the spirit of Vitriol rectified? Some
 also add threatnings, that unless I shall publicly satisfie their wished desire, my book will
 be hereafter forbidden, as another Prince of *Matchievil*: Because that, otherwise, my
 Book standing, the Universities of Medicine do consider, that they shall soon be, of neces-
 sity, as rubbish; and that *Galen* should soon beg his bread from door to door. Good men
 indeed do consule, that what things I have brought into publick, concerning the unheard-
 of Doctrine of Fevers, and concerning the detestable abuses of Blood-letting, Purges,
 and Remedies, were out of compassion to my neighbours; but the explications are
 wanting, and a more manifest speaking; as I being silent, as it were, under a sealed Char-
 ter, all things may be for the future, confirmed by the experiences of any whatsoever,
 and the out-cries of the miserable sick.

First of all, I have answered, that the secret of the liquor *Alkabeft* of *Paracelsus*,
 doth hinder; to wit, the teacher and also the dispenser whereof, the Almighty hath de-
 creed to remaine, even untill the confusion of the world, for reasons, in part known
 to Adeptists. And therefore, that I shall leave the manifestation of that *Arcanum*, to
 the treasures of the good pleasures of God.

But as to the judgments, in the meane time, to be had concerning me; I little dwell
 upon, or esteeme them.

For neither am I the first, as neither shall I be the last rebuker of those men; who never
 have had regard unto the censures of the world that have been made of me; nor do I with
 choise (the which, notwithstanding, many others do) esteeme of my esteemers. Because,
 in God, I love alike; but no man therefore, at all, because he flatters me. For I know
 that I have God for my Protector, who forsaketh none that calleth on him. For
 snares of tribulations have rained down upon my head: I stood firme, for neither have
 they

they in any wise oppressed my soul: They have fallen down on the earth, I have trampled on them with despite; and presently, as dung, they have putrified of their own accord: But the authours hereof being confounded, have blushed. I wish that God may pardon them! I know in the next place, that God will cherish the seeds which he hath planted, and the which he would have to grow, with his dew from above. Neither hath he suffered me to be carefull, for the good will of the world, for the consent of the Schooles, or shouting out-cry of the vulgar: For he can, and will do all things whatsoever he will, according to his good pleasure, when the world shall deserve to be comforted by true medicine, in their sicknesses.

Ah, how swollen a Bubble is Ambition, which always dependeth as hung up on other mens wills or judgments? How boldly last of all, do the judgments of other men, alwayes judge? Especially those which are ruled by a continual prejudice? But I speak to the questions proposed.

- 4 That as *Sol* or Gold is reckoned to be bred in the Horizon of the Hemisphere: So *Mercury*, when it is made Diaphoretical or transpirative, sweet as hony, and fixed like Gold, is Gold in its own Horizon: and it is as much more Noble than Gold, in medicinal affaires, as an Oriental Pearle is more Noble than a Scottish one. For *Mercury*, as long as it is metallick *Mercury*, is like unto the first Being of mettals, and exceeding near unto it: But when it is co-melted with Gold, all its medicinal virtue is shut up and sealed: yea it is so turned inward, that it denies the natural endowment which it owes to mans nature, for its sickness. For the sulphur of *Venus*, after its seperation from its own body, and rising againe, is made as it were a glorious Sulphur, and therefore tingeth the sulphur of *Mercury* (the which, in the powder of *Johannes De Vigo*, is turned outward by mineral Corrosive Sulphurs) immediately, and they do mutually embrace each other in an unseperable bride-bed: and therefore the virtue or faculty of both those sulphurs, doth then stand most outwardly. For, from hence, through a co-planting or conjoyning of their faculties, the *Mercurius Diaphoreticus* resulting from thence, doth perfect the *Unifone* of healing, in all things, which as well a Physician as Chyrurgion can wish for: whether it be administered in respect of acute or sharp diseases, or next with relation to Chronical ones or those of long continuance.

- 5 The Fire of *Venus* therefore, is not the spirit of Vitriol, however exactly it be rectified: but that fire, is the Volatile Sulphur of Copper, in the forme of a green oyle, being sweeter than hony, and plainly seperated from the Mercurial body of its own Copper.

But the residing Copper, remaines white, nor ever waxing green through rust, as neither is it any longer of the number of the seven mettals: Because it hath become a new and unnamed metall. But the fire of *Venus* cannot be had but with a full destruction of the copper, and Volatilizing of the Mercurial body of the Copper it self. The which, however volatile it may be, in the forme of an oyle: yet it is afterwards, by an easie businessse, reduced into a white unknown metall, and extendible under the hammer. But the fire, or Sulphur of Copper, is not likewise any longer reduced into a metall by it self: Because, even as no Sulphur is a metall; so every metallick Mercury is a true metall.

- 6 But Adeptists do teach, that the sulphurous part of a metall, cannot be seperated from its own Mercurial and metallick body, unlesse by a total destruction of the same, and the which therefore (although abusively) they call an elementary one: To wit, because there are in mettals, two Sulphurs: And the one therefore, they deservedly call the external Sulphur, and the other, the internal. But in the termes of Copper, proposed, Contemplate of that internal Sulphur, which fixeth or coagulateth the body in the white, unnamed, and Mercurial metall, and makes it easie to be beaten into thin plates under the hammer: Since that otherwise, the Mercury without the Sulphur, can never be coagulated into a metall. But let the external Sulphur of *Venus*, be that green, sweet oyle, and that which can never be againe constrained into a metall, as being in it self, an abstract.

Therefore the privy counsellours of this Philosophy, do with one accord testifie, that the external Sulphur cannot be seperated from its own body, no not by fire, in imperfect mettals, but that the Mercurial part thereof doth likewise, together perish thereby.

- 7 For I have seen Lead that was thrice sublimed, to have returned into the same Lead in number, which it was before: Therefore since that external Sulphur (such as is drawn

8 out of Copper) is not necessary for a perfect metall: But that Sulphur in Copper is

is added to the *Venus*, by God: Therefore that Sulphur of *Venus* must needs have its own ends, conducing to the necessities of ungrateful man, to wit, for mans infirmities, beyond every dignity of a metallick perfection: For the use of whom, to wit, the *Stoicks* themselves have conjectured, that all created things of the world were directed:

Therefore the Writers of the young Beginning of Chymistry, erre, as many as do feign by divers fables, a Metamorphosis or transforming of Mercury into salt, water and oyl, 9 for divers uses of Medicines, and dare to have their own inventions established by this argument: for if gold, which is the most constant of bodies, can fly away into a Vitriol, and so also, into a smoak; why shall not Mercury do the same thing, much more lawfully?

But I in answering, will in the entrance, propose two most exceeding true sentences of Phylosophers, yet for the shaming of these very Argumentaters; that from hence 10 also, those that are expert in Chymistry, may be able to point with the finger at the vanity of that argument, and that the Authors of Chymical young Beginnings, may repent.

The first whereof is, *That it is far more easie to make or compose gold, of that which is not gold, than to destroy natural gold.* Let it therefore first of all shame them, to teach the destruction of gold, who being poor, do testifie, that they know not its construction or how to make it! Therefore, either Adeptical Philosophers do lye, and are deceived, or the first Writers of Beginning of Chymistry themselves.

The second is, if I had not seen Quicksilver to delude any endeavour of Artificers whatsoever; so as that, it either wholly flies away, as yet entire, or that it doth wholly remain in the fire, and after either manner, keeps the unchangeable and primitive sameliness of it self, and an undissolvable homogeneity of Identity; I should say, That that Art was not true, which is true, without a lye, and most exceeding true; so that, that which is above, is as that which is beneath; and this as that.

They therefore bewray themselves to be ignorant of the matter of Mettals, as many as do teach the aforesaid Metamorphosis of Mercury and Gold: For however those mettals may by some Minerals, being adjoyned unto them, be sometimes driven by a Retort, into the shew of an Oyl, Salt, or Sulphur, and dissemble the mask hereof: yet those adjuncts being taken away, they alwayes remain the same gold, and the same Mercury which they were before, and return into their ancient bodies: Yea, although gold might suffer it self to be radically sequestred into different kind of parts, to wit, into Salt, Sulphur and Mercury, (which is no way possible to nature, unless by one only liquor that is to be framed or composed) yet that thing, in the simplicity of Mercury its kind, is impossible for nature and art to do; because it is that which is more simple than gold, and is composed with a greater and undissolvable identity; because there is not a diversity to be found in Mercury, such as is otherwise to be found in the tincture of gold, and in the whiteness hereof: The which I have already before distinguished in the Sulphur and Mercury of Copper: for although the Mercury of Copper be wholly made volatile, yet because it is not for that cause spoyled of its internal Sulphur, therefore it is again reduced in to a white and malleable metall.

Moreover, as to the question, wherein they ask, whether the fire of *Venus* be the spirit of 11 Vitriol rectified? I will make somethings manifest concerning the nature of Vitriol, and the distillation thereof which before have been delivered by none: For indeed, nature hath produced a certain acide or tart Mineral salt, which the *Greeks* do name *Calcanthum*; and the Latines (by an unfit name, *Atramentum Sutorium*, or shoemakers ink. But 12 the Chymists call it *Vitriol*, because it is transparent like *vitrum* or glass: But that salt is the unripe birth of embryonated or imperfect Sulphur, the which, while it licks the vein of Copper, it eats into the vein, and therefore it is called *Copereous*, or gnawn Copper: But if it shall gnaw a vein of iron, or of other Mettals, it produceth sharp fountains, and those divets, according to the disposition of the vein that is gnawn; which things I have professedly, and at large prosecuted in a little book concerning the fountains of the Spaw.

Furthermore, whether that water, which contains in it the salt of Embryonated Sulphur, and keeps with it the gnawn vein of Copper doth distill or drop by it self, or be 13 boyled by fire into the consistence of Vitriol; or in the next place be elsewhere coagulated of its own accord; that no way distinguisheth of its kind or goodness: for truly it looseth nothing hereof in boyling: For when the watery liquor hath in boyling sufficient-

ly exhaled, the residue is at length, afterwards, of its own accord, coagulated in the cold. But the diversity of veins alone varies the price of Vitriol; for nigh *Antwerp*, while the Sulphur is melted out of the fire-stone, the rest is exposed under the open air, and as to the greater part of it, doth by little and little melt: for by the scorching and smoaky fumes of the Sulphur, it conceiveth a rust, which is known by the residing salt, and through rain, flowes down into the ditches. So also, the neighbouring *Eburians* do prepare their Vitriol from a richer vein. Elsewhere indeed, there is a vein of the very Copper it self, being rich in the coagulated salt of Sulphur, and it drops, flowes abroad, and is coagulated of its own accord, which otherwise is washed off or dissolved by the moistness of the neighbouring fountain.

14 The difference therefore of the goodness, consists in the purity of the salt: but not in the wealthiness and plenteousness of the Copper; (for I speak not as a Merchant, but as a Physitian) it differs also, by reason of the co-mixture of a certain forreigner; to wit, if in the fire-stone, or vein of Copper, a vein of Lead be co-mixed (which is frequently obvious) or perhaps there be present a malignant participation of Arsenick; (for Arsenick, because it for the most part ensnares and accompanies mettals, hence by a usual name, it is called the Fume of mettals) And so, that which otherwise would be a lawfull Vitriol, is made hurtful in healing: But the *Azure* or sky-colour of Vitriol is for the most part preferred before the green colour; perhaps, because that more pleaseth the eyes: at leastwise, by a most easie business, the Be-juglers of Simples do of green Vitriol, dissemble an Azure colour therein.

15 But moreover, the *Chalcitis* or red Vitriol, the Mysy, Sory, and Black of the *Greeks* have at this day perished, as unprofitable distinctions of the veins of Copper; For the *Greeks* are only Alphabetaries, and in respect of the *Germanes*, a sluggish generation, whatsoever the antient ones have published to posterity concerning the matter of mettals.

16 But there are some, who with *Paracelsus* commend and extol that Vitriol in healing, which is accounted the most rich in the plenty of Copper; and so they prefer that before all, which is composed out of the Copper it self. Some therefore sprinkle Sulphur on bright-burning or melted Copper, and so by great labour procure the green rust thereof, &c. But *Paracelsus* prepares the best Vitriol in healing, by plates of Copper, being spread abroad, through cementing them with common Salt and Sulphur.

The more modern ones being from hence seduced, do repeatedly distill the thin plates of Copper, by the spirit of common Sulphur, or Vitriol, until they are plainly black and bricke, the which, at length they melt in water, and it becomes of a sky-colour; the which, in boyling, is thickned, and a Vitriol growes together in the cold: For so indeed, that is at this day adulterated, which is set to sale for *Cyprus* Vitriol.

By the leave of *Paracelsus* I know, and certainly find, that Vitriol made of Copper, is far more sluggish in healing, than the common Vitriol, which wants the suspicion of Miscellanie or Hotch-Porch things: And so, that the spirit thereof, is nothing but a meer Mineral Vinegar deprived of the vapour of Coppery Sulphur. For I have certainly found, that the Vitriol made of Copper, is far more poor, than that which is dig'd out of its Mineral vein: Likewise that digged Vitriol, wherein there is very much Copper, is slower than the common sort, in healing and distilling.

For I have distilled Vitriol that was prepared by art, being of an Azure colour, and in no wise to be distinguished by the sight, from *Cyprus* Vitriol; and it yielded a little sluggish acide spirit, and all its spirit by and by ceased within a few hours; and all its remaining body, abode condensed into a black *Feces* or dreg, and restored its Copper unto me, according to my wish.

For truly, Copper is a compleat mettall, not easily to be destroyed, or returning back unto its own Principles: So that although it be diminished through the cruelty of fire; yet whatsoever thereof shall fly away, is as yet a true mettall, for the reasons above alledged.

Truly, among Metallick veins, there is none with the like difficulty brought unto the perfection of a Mettall, as is Copper it self (the which, *George Agricola* testifieth) for truly, it requires to be re-coated at least nine times, before Copper issue from thence: whereas the while, the veins of other Mettals pour out their treasure at the first melting. The vein of Copper therefore attains its perfection by a sequestration of the parts mixed with it from its nativity: But these parts are those, which are as yet fast bound unto their own first Being: from whence, it therefore, the Copper being now perfect, re-

refuseth, and as stubbornly as it can, resists a dissolution of its body, and by consequence, neither can there a perfect Medicinal Vitriol be had from thence, which may have a vertue from the Sulphur of *Venus*, because this is not separable from the Copper, unless by an every way destruction of the Metallick Body, even as I have before taught.

Those parts therefore of the Copper vein, which are far remote from a Metallick nature, and which are the nearer to their first Being, do afford a medicinal vertue unto Vitriol, which is denied unto *Calcanthum* or Vitriol artificially made: For the common and base or cheap Vitriol, doth breath forth its exhalation, but in a full eight days space at least, However it may be urged with the most ardent flames of a *Reverbery*. By how much therefore freer the vein is from a foreign Malignity, and shall be nearer to the first Being of *Venus*, to wit, the farther off from the Metallick constitution of Copper; by so much the salt thereof, which is bred in it of its own free accord, and co-melted with it, doth produce the more unblamable Vitriol, and affords the richer spirits, and those most fit for healing.

But the unusual manner of distilling it, is this: Take of common Vitriol, that is not suspected of a foreign Malignity; let it melt, by boyling it in a large earthen Pot, and let it be boyled even to a dryness: The Pot being broken, let the Vitriol that is now hardened like a stone, be beaten into a powder: But let the distillation be made by at least six Retorts at once; and let those Retorts be of glass: For all stonie ones are porous; because all earth retains pores; For that, after its drying, something that is not fixed, doth of necessity puff out: Moreover, let the Retorts be fenced with a crust or parget, which may neither cleave asunder, nor contract chaps, or fall down of its own accord, or be too much glassified: Let also the neck of the Retort which hangs out, be most exactly connexed unto the large receiving vessel, that not so much as the least thing may expire: But let the Receiver be placed in moist sand; likewise, let the boughy part thereof, be covered in a Sack, being filled half full with moist sand: Which Sack, let it be divers times renewed, being tinged in the coldest water: But let half of the Retort be filled with powdered Vitriol: But distill it by degrees, and at length let it be urged with coal, as much as is possible for the furnace of wind, which is blown by its own iron grate. But when the furnace of wind shall cease to dismiss the spirit into the receiving vessel, let the porch be opened on the side, by which way the Reverbery of the flame of the wood, may pierce under the Retort; and let it so continue for five or six nights, with the highest fire, possible to nature. The Retort perhaps, in so great a storm of the fire, will seem to thee to melt; but nevertheless, it will endure constant throughout; because the outward coat of male or fence of earth, with-holds and sucks the glass; and so it is englassened, as much as shall be sufficient for the work. At length, remember thou to sequester the receiving vessel from the neck of the Retort, the fire being as yet most ardent; otherwise, thou shalt see, in a more cold station, the spirits to return into the Lee or Dreg which spewed them out.

Then lastly, take the *Colcotar* or Lee remaining of the distillation, which thou hast reserved from true Cyprus, Hungarian, or at leastwise, Goslarian Vitriol: Let that residing dreg being co-mixed with Sulphur, be again burnt, unto the every way consuming of the Sulphur: But afterwards, thou shalt bedew and moisten this *feces* with the aforesaid spirit: For that spirit, as it is presently imbibed in the glassen dish or gourd: so being fetcht again from thence, it returns nothing but a watery and unprofitable phlegm, the spirit having remained imbibed in the *Colcotar*: And repeatedly renew thou that operation six or seven times, until at length, the spirit that is poured thereon, wax red, which will swim upon the *Colcotar*, which is a sign, that we must cease from the plenteousness of imbibing: And so let this rich *Colcotar*, being well dried, be put into a Retort; and let this rich *Colcotar* be distilled even unto its utmost spirits now waxing yellow, and casting the sinelling odour of grateful honey.

Yet remember thou to draw away the receiving vessel from the Retort being as yet of a bright burning heat, and that this spirit must be kept, by the mouth of a more strong bottle being close stopped with wax; Whereinto lastly, if thou shalt cast water, the vessel it self presently breaks asunder: Therefore, by the only spirit of the former distillation, this second spirit is bridled or restrained; whereof scarce one pound is poured over from bottle into bottle, but there is made a loss of one ounce at least: And likewise, unless the Receiver be seasonably taken away from the Retort, as I have said: thou shalt see the Furnace being cooled, that most potent spirit to have returned into

Colcotar, from whence it was struck out by fire. Moreover, the Lee of Colcotar which is left of the second distillation, is as yet wholly Coppery, and waxeth green after many fashions :

21 From whence 1. That is manifest, which I taught before : Namely, that the fire of *Venus*, is not to be drawn out and had, but by an every way destruction and separation of the mettall.

2. That this therefore must be done by a far more hidden way.

3. That the *Vitriol* which is rich in *Copper*, is less fit for distillation than otherwise, the common *Vitriol* is.

4. That the *Vitriol* of *Copper*, pouteth forth the spirit of the Vinegar of a mineral salt, but not the volatile Liquor of *Copper*.

5. And therefore that the *sulphur* of *Copper*, is rightly called the *sulphur* of the *Philosophers*, being fit for long life : Being sweet, I say, in tast, but not tart or sharp.

6. That the spirit of *Vitriol* which is above perfectly taught, cures some Chronical Diseases.

7. And that therefore, the spirits of *Vitriol*, hitherto sold and in use, are nothing but a mineral Vinegar, being also adulterated in it self.

8. That the refining *Colcotar*, is most rich in a Medicinal Virrue.

9. That the preparation of *Vitriol* prescribed by *Isaac Holland*, and other Moderns, hath not sent the Arrows unto the true mark.

10. That our spirit above described, and thus rectified, as it is volatile and salt, proceedes even into the fourth Digestion, and resolves disease Excrements that are met withall in its journey ; And by consequence also, takes away the occasional cause of many Chronical or lingring Diseases.

22 I have therefore already delivered the like Form or manner of distilling the spirit of Sea-salt, of *Salt-peter* and the like ; Yet thou shalt remember, that *Vitriol* hath in it self the earth of *Colcotar* : wherefore the other salts do desire dried *Porters earth*, and that being exactly admixed with them.

23 But besides, I have already delivered the manner of preserving from the Disease of the Stone, by *Aroph* ; and likewise, by Ale boyled with the seed of *Daucus* or the yellow wild *Carrot*. I might therefore desist, and repose my Quill, and leave the matter to others, more successfull than my self ; by wishing, that every one may henceforward add what things he shall find out to be farre better. For since *Duelech* besiegeth onely mankind, and is produced from Excrements themselves, after an irregular manner, but doth not arise after the manner accustomed to other infirmities : Therefore it seems to be singularly bred, for a revenge of sin, even before other Diseases, and to be permitted by God, in Children, being as yet Innocent, for the averting of a greater evil : For although some Bruits do generate small stones in themselves, yet those stones are not bred in them from the Causes of *Duelech*, nor appointed for a punishment, or tribulations unto them : but rather produced for the profit of man. But if therefore *Duelech* doth relate to the fault of sin ; but since sin hath drawn its rise from a Wood or Tree ; it hath seemed also to me, that preservation of health, in the disease of the stone, is not onely to be expected from the seed of *Daucus*, and some such like Herb, but from some certain Wood : Wherefore it is indeed true, that a Wood against the stone of the Kidneys, hath been of late brought unto us out of the *Indies* : but I have not ever therefore perswaded my self, that divine Goodnesse had so long denyed unto the *Europeans*, that it might succour even the poor man that had the stone, untill that, through many expences, a Remedy should after three thousand yeares, at length flye unto us from the *Indians* : which otherwise had been slow enough in it self.

The wild *Carrot seed* indeed preserves, under a continual and strict obligation ; even as *Aroph* comforts the Kidneys by much cost. I therefore have seriously enquired, whether there were not a certain Wood familiar to our Countrymen, which might supply the room of that Nephritical One, at length sent us by the *Barbarians* ? For truly, the wood of Sin, and the wood of Life, were Trees, but not shrubs, and much lesse Herbs.

24 Wherefore I heretofore observed, that it was a familiar or natural thing with the Princes of *Germany*, that every Year in [the third month called] *May*, they would, against the affect of the stone, drink daily, a draught of the Liquor issuing out of the Bark of a wounded *Birch-tree* : which Liquor they preserved from the corruption

ruption of the Ayr, by pouring on it Oyle of Olives. The Tree is wounded: The Tree is called by the *Germanes Bircken-Baum*; but by our Countrymen *Bercken-Boom*. For the Bark of the *Birch-tree* is wounded nigh the earth, in the Trunk of the Tree in [the first month called] *March*, about the time wherein the Vine being wounded, is wont to weep out a very young or tender Liquor drawn out of the earth. But that Liquor of the *Birch-tree*, is wholly watery and almost without favour: But if any branch or bough of the thicknesse of three fingers, be wounded unto its Semi-diameter, and be filled up with Wool put into the place, there presently weeps out a Liquor, not ungratefull, but somewhat sharpish: which also in the very Torment of the Disease of the stone, comforts the afflicted, three or four spoonfulls thereof being taken. That therefore, is more meer or pure, which flowes from above, from the boughs, than that which flowes forth from beneath out of the Trunk: But that is plainly watery, which flowes forth nigh the earth. For I presently considered, that that happens, as in ascending, it might passe through a somewhat reddish Bark, which was as it were the liver of the Tree: But since that Bark was all the Year without any notable tast; But the outmost Bark being white, and as it were membrany, had a favour and perfume as it were of the best *Turpentine*; I rent off the more outward Bark round, from the Trunk, about the space of half a foot; and I observed, that neverthelesse, the Liquor which distilled from the Branches, was of the same tast as before: Therefore I wondered, from whence that diversity of Liquors of one and the same Tree, should spring.

In the next place I wondered, that some one small bough, should in one onely day, easily weep out eight or ten pounds of Liquor, which otherwise hath not need of so much nourishment, for a whole Summer, nor room wherein so much Liquor could be kept: and much lesse doth the Root bestow so much Liquor by about tenfold, on any of the other Branches: yet neither therefore, was there sufficient nourishment wanting to the other Branches, although the Root had otherwise attracted that much quantity of that Liquor, and had poured it forth through some other Branches. I therefore considered, that that Liquor was like unto the *Sunovia* or gleary water, issuing out of a Wound; Yea, I began to detest it, as if it contained in it the Contagion of Death or putrefaction: neither that it could give Health, if it did now bear it in a blemish of integrity: Yet I certainly found, that as well the wood it self of the *Birch-tree*, as the red Bark thereof, were spoyled of the faculty of Healing, but that the white Bark or Rind, outwardly growing to the more young Branches like Parchment, being easily inflameable, and marked with the favour of *Turpentine*, did scarce disperse a vertue from it self, into a decoction: Therefore I considered, that the aforesaid vertue of the Liquor, did not proceed from the Root, nor from the Wood; next, not from the somewhat red Bark; as neither lastly, from the white Rind; because it was that which in many places was not continual to it self, in the Stem. Therefore I tryed to distill that Bark, both by it self, and also with an addition of the *Lixivium* of *Tartar*; but surely, the Liquor that was dropt out of the Wound of the Bough or Branch, did far excell the Oyle and distillation of the Barks. Therefore I am reduced to acknowledge, that that Liquor voluntarily flowing out of the wounded Branches so abundantly, is the meer Balsam of the Disease of the stone; neither doth that hinder it, because through my wantonnesse, I compared that Liquor unto water flowing out of a Wound or Ulcer: For truly, the Wound and Ulcer, which in us, brings or promiseth death, brings or promiseth to the *Birch-tree*, no such thing. That Liquor therefore of the *Birch-tree*, is a Medicine promised from Nature, but procured by the Wounds: and so, it is to urge Nature to bring forth a Balsam naturally unto her, the which else, she will never bring forth. Wherefore I commanded the young, tender, and somewhat blackish small Branches (from whence the Brooms and Rods of our Country Folk are made) which had swelling, not yet leavie Buds, being dashed with a Hammer upon a stone or Anvil, to be boyled together in Water, ordained for the making of Ale or Beer; unto which Ale or Beer, if afterwards I adjoyned the seed of *Daucus*, or *Brook-lime*, I obtained desireable effects for the prevention of the disease of the stone, and those as yet more powerfull ones, if that Liquor of *March*, being collected from the upper Branches or Boughs, had been poured into the Ale, after the greatest settlement of its boyling or working, which Wines and Ales do voluntarily undergo in Hogs-heads.

For first of all, I have certainly found, that that drink of the *Birch-tree*, did take away the
 Y y y y 3 25
fear

fear of *Diureticks* or *Urine-provokers*; Because it loosens the paines and *Contractures* of the disease of the stone, as well in the Loines as in the Bowels: (for from hence the one onely disease of the stone, stirs up even Colick paines, no lesse than if the fewel thereof were in the Bowels) and therefore also it heals *Dysuries* or difficulties of pissing, and *Stranguries* or pissing by drops, even in old Folks. It likewise at first, mitigates the heat of the Liver, having arisen as it were from a Thorne thrust into it, and afterwards, takes it away.

Lastly, A certain *Bridegroom* being bound up for five months that he could not reach to his *Bride*; in the mean time begat his Chamber-maid with Child: Afterwards, chidings having arisen between the betrothed Couple; the *Bride* said, that she had dissembled that wickednesse with the Chamber-maid, that she might perfectly espy, whether he were cold, or indeed mischiev'd, and by what title, she might attempt a divorce. At length, the Enchantment of that binding up, was loos'd by the drink of the aforesaid Ale, and he was found to be mischiev'd, but not to be cold. Last of all, A certain man making water according to his custom, in the corner of a Floor, presently lay down, as being afflicted with a bloody and cruel strangury; but any Remedies of *Physicians* were in vain; except that, as oft as he drank of the aforesaid Ale, he perceived a notable ease: but as oft as he arising out of the Bed-cloathes, walked up and down, and pissed in his wonted place, he presently suffered Relapses. At length, there was seen, a pin made of old and black Oaken wood, fastened or thrust into the place whereat his accustomed urine issued out. That pin therefore being pulled out and burnt, by the drinking of that Ale, he remained altogether free from that bloody strangury. And then I remember, that *Karichternus* writeth, that he had loos'd the like sort of Enchantments, onely by pissing through *Birchen Broomes*.

CHAP. IX.

CHAP. IX.

Sensation or feeling, unsensibleness, pain, lack of pain, motion, and unmoveableness, through diseases of their own rank, the Leprosie, Falling-evil, Apoplexy, Palsy, Convulsion, Coma or Sleeping-evil, &c.

1. Grating or fretting only is reputed the cause of the pain of him that hath the Stone in the Reines. 2. The opposite is proved. 3. For so the Urine-pipes should want a feeling. 4. The definition of pain, according to the Schooles. 5. The opinion of the Antients and Moderns concerning the first or cheif organ of the senses. 6. But it teacheth nothing besides vain words. 7. The implicate Blasphemies of the Schooles. 8. That the braine is not the immediate organ of sense and motion. 9. What hath deceived the Schooles about these things. 10. A better attention or heed of some. 11. From whence they have so perswaded themselves. 12. The Authours meditation about sense and motion. 13. A speculation about the solution in a wound of that which held together. 14. A solide part doth not feel, of it self. 15. Three organs subordinate to motion. 16. The Schooles go back from their former supposition. 17. That the sinew is not the proper instrument of all sense. 18. A consideration of the Leprousie. 19. All sinewes dedicated to motion, are also sensible. 20. The errors of the Schooles about the Leprousie. 21. The error of Paracelsus. 22. The unconstancy of Paracelsus. 23. The unsensibleness of the Leprosie, from whence it is. 24. Manginess, and the Pox or fowle disease, how they differ from the Leprosie. 25. Scabbedness requires not internal remedies. 26. The Reader is admonished. 27. wherein the difficulty of curing the Leprousie, is seated. 28. Hipocrates had not as yet known the immediate subject of sense. 29. Life, what it is. 30. A nearer Doctrine concerning sense. 31. The immediate subject of sense. 32. A deaf or dull definition concerning the Sensitive soul. 33. How Sensation or the act of feeling happens. 34. Why for sensation, there is no need of recourse unto the Braine. 35. The seat of the Mind. 36. What pain is. 37. In what sense, pain may be action and passion. 38. Pain and a disease, by what Beginning, they may be made. 39. Of what sort, anger and fury are, in this place. 40. Pain, what sort of passion it is. 41. Concerning the Apoplexy. 42. The manner delivered, of making the Apoplexy, is ridiculous. 43. Paracelsus, about this place, is a like frivolous and unconstant to himself. 44. The meditation of the Authour. 45. Some absurdities accompanying the Schooles. 46. A new distinction of causes. 47. A stopping up of the arteries in the throate, what it may argue. 48. That a positive Apoplexy is hitherto unknown by the Schooles, and practitioners. 49. That the Apoplexy and Palsie are not made from the afflux or flowing of phlegm into the bosome of the Braine. 50. Galen is ridiculous in the like contexture of the brain. 51. An examination of some remedies. 52. That an Apoplexy is not the primary affect of the braine. 53. That there is a tasting in the midriffes. 54. A secondary passion is proved to be from below. 55. The properties

properties of the head, how far they may ascend in themselves. 56. A true Apoplexy is positive, not privative, and that the Schooles are ignorant of. 57. The astonishment or unsensibleness of the Schooles, is noted by the astonishment of the fingers. 58. The manifold impossibility of the Schooles, which follows upon a privative Apoplexy. 59. The Schooles are astonished in the astonishment of the touching. 60. A history of the astonishment of the hands from a Quartane Ague. 61. The rise or original of a positive Apoplexy. 62. The Palsie is a contracture or convulsion of the sinewy marrow. 63. The Palsie is oftentimes without the Apoplexy. 64. The shortnesse of the neck what it may argue. 65. From whence frictions or rubbings in an Apoplexy, were instituted. 66. Why they are ridiculous. 67. The anguishes of the Schooles. 68. The rubbing of the skinn contradicts the phlegme of the Cerebellum or little brain of the hinder part of the head. 69. The generation of the stupefactive or sleepifying matter of an Apoplexy. 70. Why the Apoplexy, is called by the Germans, a stroak. 71. The place of an Apoplexy, is proved to be in the Duumvirate. 72. The stumbling of the Schooles, about the examination of the property of simples. 73. Against the position of the Schooles, concerning the phlegme of the fourth bosome of the braine. 74. The perplexities of the Schooles concerning the hurting of the sense, motion remayning safe, and on the other hand. 75. It is explained by some positions, why sense may be hurt, motion remayning safe. 76. The Apoplexy, after the manner of hereditary diseases lurks in the formative faculty of the seed. 77. Against the cause of the Schooles for an Apoplexy. 78. Against the cause of the Schooles for a Palsie. 79. The causes of the Apoplexy. 80. That the Apoplexy doth not consist of a privative cause. 81. The definition of an Apoplexy. 82. What a true Palsie is. 83. Diverse stupefactive remedies. 84. That sleepifying medicines, as such, do not cure madneses. 85. What hath deceived the Schooles herein. 86. A sweet Anodine or pain-ceasing medicine is harmlesse. 87. Why Anodines as such, do not presuppose cold. 88. What a sleepifying medicine is. 89. An Anodine pertaining to the Falling-sicknesse, differs from that of the Apoplexy. 90. A returne unto paine. 91. There is a forreigne consent for paine. 92. From whence paines are con-centrall with the Stars. 93. Whether the renal blood be informed by the soul. 94. Sense and pain, wherein the may subsist. 95. What may cause paine, and after what sort. 96. Whether sense or feeling be made passively. 97. The primary cause of paine and sense. 98. The Schooles stay behind. 99. The consideration of life, hath regard hitherto. 100. A vain privy shift of the Schooles. 101. A demonstration of the fire, that pain and sensation may from thence cleerly appear. 102. That these things have layen hid to the Schooles. 103. What is to be considered for searching into the proper agent of paine. 104. The rules of the Schooles concerning the activity of simples, is reproved by the way. 105. From whence the Schooles have been deluded. 106. A paradox is proved against the Schooles. 107. Sensible agents act on the sense only occasionally, whether they are medicines, or not, fire excepted. 108. An application of virtues, by what meanes it may be made. 109. Sensation consists in the vitall judgment, and so also, in that of the Soul. 110. Some consequences for the demonstrations of things before passed. 111. From whence the faculties of medicines have been estranged in the Schooles. 112. How differently the fire can act. 113. The unconsiderate rashnesse of the Schooles. 114. Some sequels drawn from the foregoing particulars. 115. The differences of paines. 116. A convulsion is the companion of paine. 117. The paine of the disease of the stone. 118. The blockish opinion of the Schooles, concerning the convulsion or Cramp. 119. Its falshood is manifested. 120. Errours meeting us. 121. Some negligencies of Galen. 122. Galen looseth the name of a Physician from the censure of his own mouth.

123. Galen hath taught only childish devises. 124. Arguments on the contrary. 125. The error of the Schooles concerning the Convulsion is concluded. 126. Ridiculous similitudes made use of by the Schooles. 127. Some remarkable things. 128. After what manner the Convulsion is made. 129. A twofold motion of the muscles, is proved. 130. The Convulsion is not properly, an affect of the head. 131. Example of parts convulsed. 132. A sight of a colicall contraction in a child. 133. An Artery, from whence it waxeth hard. 134. Divers contractions. 135. That the causes of the Cramp have layen hid. 136. The neglects of the Schooles. 137. The degrees of paines.

THe pain of the Stone in the kidneys, being one of the cheif and most troublesome of paines, is very great and cruel. For the Schooles are at rest in accusing the cause of so great a pain, to be a fretting or grating made by the Sand or Stone.

But I have perswaded my self, that there was nothing at all of satisfaction from that answer: And therefore I have made a further search: Because some one very small Stone sliding out of the kidney, doth at the first turnes, cause more cruel pain, than any the more big one afterwards: the which notwithstanding is undoubtedly, more than by its fretting, to wrest or wring, to excoriate or pluck of the skin of, and extend the urine-pipe.

For truly in persons grown to ripe years, the spermatick parts of the first constitution, do no longer dayly grow, and so neither is their Ureter enlarged afterwards, by the descending of the stones.

In the next place, the slender sand hath been oftentimes very troublesome through its paine, and hath cast down the howling man on his bed, before it proceeded out of the kidney, and the which therefore, was never as yet injurious by its rubbing on it or grating, of it: neither also, is it sufficient, to have spoken of fretting or grating, for the proper and total cause of so bitter a paine. For the Ureter, throughout its whole passage, hath not the commerce of a finew implanted in it; the which therefore, ought even to want sense or feeling, and by consequence, also pain.

For truly, the Schooles define pain to be a sorrowfull sensation, made by a hurtfull thing rushing on the part: If therefore the slender and un-savoury sand, be void of all tartnesse, and fretting or grating, or the smal clot is not guiltlesse, because neither without pain: certainly, to have toucht upon the causes and race of sense and pain, together with its circumstances, shall not be disagreeable to the treatise of the disease of the Stone. First therefore, and in the entrance of sense the, Touching of pain comes to be considered.

For therefore, the Schooles teach, that the Braine is the first and principal organ of all the senses and of all motions, and by consequence also, of pain and un-sensibility: To wit, the which should discern the objects of the senses, by the animal spirits, being on every side dismissed from it self, into all the propagations or Sprouts of the sinewes, and therefore, as into the patrons of all sensations, so also, as into the interposing messengers and discerners thereof. They presume to themselves, that they have spoken some great matter in this thing I will speak more distinctly. And moreover, I shall say nothing, or at least wise I will declare a matter, which is of no worth.

For indeed, the Schooles confesse: that the Braine doth in it self, feel nothing, or scarce any thing: and that therein, it is like the first universal Mover, which the moderns (also Catholiques) do with Aristotle, command that he ought to be unmoveable, if he ought to move all other things (as if the unutterable first mover, cannot move himself, or that he ought to be unmoved, and wholly unmoveable, yea, that he acts and perfecteth by his own touch of local motion, all things in a moment:) who in very deed, moveth not any thing but by an absolute and most abstracted becke of Omnipotency (and let this be an absurdity of the Schooles, by good men, accounted for blasphemy, by a Parenthesis here noted by the way.)

Notwithstanding, the Brain is not the primary, or adequate Organ of sense and motion: seeing that in it self, it is unmoved and deprived of sense. For the Schooles beholding, that a turning joynt of the back, being displaced; for that very cause, whatsoever was subjected to the Nerves and Sinewes beneath that turning joynt, was also, without sense and motion: therefore they straightway determined, the Brain it self, and the marrow of the Thorne of the Back, the Vicarlesse hereof, to be the adequate or suitable Organ or Instrument of sense and motion.

But other Writers being willing to give a nearer attention, since they acknowledged

Zzzzz

and

and confessed the substance of the Brain to be deprived of touching, nor to be voluntarily moved, but that the twofold membrane or filme, endowed with the name of *Meninx*, was of a most acute touching, although unmoved; They decreed that every sinew, how slender soever, was over-covered with such a double membrane, and did borrow it from both the *Meninx's* of the Brain; that this very membrane of the sinewes was (to wit consequently) formed under the one onely endeavour of Formation, and labour of the seed of *Fabrication*: Even to that also, these would have it, That every Nerve should draw its own feeling from the little filme that covered it, which did not any way answer from its substance, unto the marrowie substance of the Brain.

11 Perhaps they took notice, that in the stomach and womb, so great and so excellent vertue were inmates in the naked membranes thereof: and therefore that neither was it a wonder, that something very like unto those, had happened unto the filmes of the Brain, from a prerogative of the same Right.

12 I have altogether proceeded something otherwise, for the searching out of sense and pain, and the Organ, objects, and causes of motion and feeling. I considered first, that while a wound is as yet fresh, it scarce paineth; but anon, while the lips of the Wound do swell and rage with heat, that the wound causeth a sharp pain. And again, while its lips grow flabby and do pitch or settle, that though the wound be also open, yet it is almost without pain.

13 From whence, I collected, That the solution or loosing of the con-tinual or that which held together, causeth pain indeed in the time of its making; but that, in its being made, if that which is inconvenient, shall not have access to it, the thing solved doth scarce pain the party: Therefore I supposed with my self, that the solution doth not pain, as it is a separation of the con-tinual: and much lesse doth the heat cause pain, which arose in the wound the third day after; whose property indeed it is, onely to heat, but not to cause pain: But if any external or foreign heat, being extended into a degree, doth burn; it causeth pain indeed, but not as heat, but as it is that which stirs up, and at least, which nourisheth the solution of the Con-tinual: And besides, the indispositions of Acrimony or sharpnesse, and as proceeding from another Root, which vitiates our Family administration. Truly, because a body, or solid part doth not feel of it self; Because

14 it is rather a dead Carcase; Sensation or the act of feeling therefore, hath regard indeed unto the Life alone. And since the *Schools* knew that the Brain had none, or at leastwise, scarce an obscure Sensation: They therefore had rather believe, the sinew to be the primary subject of sence, motion, and pain: To wit, that the Brain was indeed the Fountainous Beginning of sence and motion: yet they made the Nerve the immediate subject of pain and sence. But notwithstanding, they would have motion, although something a more material thing, to depend on a deeper arbitration of the Will, and to be subjected thereunto: To wit, so, as that, the Will is the Commandative principle

15 of motion, but the sinew to be the derivative Organ of the command of the Will: And lastly, the muscle to be the executive Instrument of the Will: But they understand Sensation in the sinew, as in its subject, to be made through the mediation of the animal spirit, which they call *Animal*, being drawn indeed from the Arteries, but re-cocted in the Brain, for its own uses. They therefore acknowledged, that the Nerve is by it self, indeed without feeling, even as the Brain and other solid members are: wherefore they will

16 have the animal Spirits to be the primitive Feelers, and effective Movers of Sense and Motion it self: With whom; I do not as yet agree, as neither in this, That the sinew is the Organ and chief Subject of all Sensation: For who knows not, that in a healthy person, every part of his skin is sensible, yet that it carries not a sinew under it? For I do not grant, that a sensible object being conceived in the parts without a Nerve, the Spirit doth by a Retrograde motion, run back into the sinew, that it may communicate

17 that sensible Conception unto the Brain, as unto the original of the Senses; that by returning from thence, a sence of pain, or well-pleasing, may then at length be effected in the part that is hurt or touched on. For the Urine-pipe causeth exceeding pain in the Borders, without the implanting of any sinew: So also hollow Ulcers; are oftentimes filled with sensitive flesh, neither yet do Nerves grow anew therein; seeing the parts of the first Constitution, being once taken away, do not grow again; as neither are those parts which are of the first Constitution, being consumed by rottennesse, any more restored.

18 But the stupidity and unsensiblenesse of the *Leprosie*, do fitly offer themselves in this place. For truly, they at all feel not a Bodkin or Needle, being thrust into their flesh. Must we therefore believe, that Leprous persons are deprived of sinews? Or that in those the Nerves are cut off from the fleshy membrane? That they are deprived of Animal Spirit, and bereft of Life? and that they are stopped, even as they are said to be in those

those that have the Palsie? Shall therefore the sinews of touching be stopped up throughout their whole Body, and shall their sinews be serviceable onely for a free motion? Shall, I say, the motive sinews be now destitute of sense alone? I confesse indeed, that 19 from the formost part of the Brain, there are sinews dispersed unto the eyes, eares, Pallat and Tongue, which serve onely for feeling; neither that they do decline unto the muscles, which are as it were the proper Instruments of motion; But none can also deny, but that the sinews dedicated unto motion, and the which go out through both the turning joynts, do also bestow sense or feeling. For what if in the Leprosie, a sinew that is the effecter of motion, be now moved by the Animal spirit, neither yet hath the faculty of sense? Why therefore in the Palsie, under a hurting of the same sinew, is as well motion as sense, taken away; but in the Leprosie, is sense onely taken away?

First of all, The *Schooles* hold the Leprosie to be incurable, and also a universal Cancer of the Body: For while they suppose a particular Cancer to be incurable, much more, a universal one: Which prattle of *Galen* was to this purpose framed, That by the impossibilities of healing, he might excuse his own Ignorances, and the sloathfulnesses and dis-clemency of taking paines. For a Cancer in the flesh, is of a most sharp pain, and of a continual devouring; But a Leprosie in the flesh is without pain. I see not therefore, after what manner the Leprosie among the *Galenists*, shall be a Cancer. 20

In the next place, *Paracelsus* errs, who thinks the Leprosie to be deprived of all salt: 21 and for this cause, that an unsensible astonishment is proper unto it; As if the very sense of touching, were onely in Salt. For the Leprosie hath its own ulcers: and according to the same *Paracelsus*, there are as many Species of Ulcers, as there are of Salts: Therefore according to that his own Doctrine, the Leprosie flowes from a Salt abounding.

Let us grant to *Paracelsus* (yet without a diligent search of the Truth) that the Excrement of the paunch in a Leprous person, doth abound with small graines of Salt; and that the urine of the same person doth no longer dissolve any thing of Sea-salt: (both whereof, notwithstanding, are dreamed by *Paracelsus*) Yet that would not prove, that the flesh and blood of a Leprous person, do fail of their own salt: And much lesse also, that their flesh doth therefore fail of the sense of Touching. For first, This his opinion concerning the Leprosie, utterly overthrowes his own Doctrine concerning the three first principles of Bodies. And then, even as there are of un-savoury, and unsalt things, manifest salts daily concocted in us, from the Law of humane Digestion; so, although the excrements of Digestions were nothing but a meer salt, yet should not the venal blood therefore be deprived of its own salt: Because it is that, which borrowes not its salt, and the necessities of its own Constitution, from excrements: Yea, it should rather follow, that seeing the Leprosie is such an abundant productress of salt in the excrements, the venal Blood also shall not want its own salt: Even as, while there flowes a continual *Sanovie* or gleary water, and that plainly a salt one out of ulcers; the remaining blood doth not therefore want its salt, or sense is not diminished in the flesh, but rather encreaseth the pain and sharpness: So also in the Dropsie, a salt water doth sometimes forthwith extend the *Abdomen* or neather Belly, yet do not dropical persons want the sense of Touching.

For *Paracelsus* elsewhere, defineth the venal Blood to be the meer *Mercury* of man, 22 from which those excrements are sequestred in the shew of a putrified *sulphur*; and likewise, of a Whey-ie, unprofitable, and superfluous salt. Elsewhere again, as being unmindfull of himself, he defines the Blood to be the salt of the *Rubie*: As though salt were the Tincture of the *Rubie*, or that the Tincture of the Blood were from a salt: For he makes his three first things, mutable at pleasure; no otherwise than as the Humourists do accuse their Humours and Heats, at pleasure: and which more is, do say, that the same are the causes of Diseases, and Death; and also the Authors of sensation and motion. Eye! must we thus sport at pleasure with Nature, Diseases, the Blood, and Death of our Neighbour? For Medicine is plainly a serious thing; and man shall at sometime render skin for skin. For salt doth not appear in the Blood, flesh, solid parts, &c. except in the last and Artificial separation of those Beginnings, after Death, and that indeed by the fire: To wit, after that the sense of Touching hath been a good while extinct. Those Dreams of the principles do not serve for the Speculation of motion and sense. A mark imprinted by the Devil on Witches, is wont to bewray these, because the place of the Brand is voyd of feeling for their whole life: and that mark being once impressed, hath its own natural Causes of unsensibleness, after the manner of the Leprosie; yet enrouled in a certain and slender Center. For the Witch, her eyes being covered; if a Pin be in that place, of the Brand, thrust in even to the head, that prick is made without feeling.

At leastwise, that place should by a wonderful priviledge be preserved all her life time; without salt and putrefaction, seeing that otherwise, the life according to *Paracelsus*, is a Mummy, with a comixture of the Liquor of Salts.

Far more sound therefore is the doctrine of *Hippocrates*, which decreeth the Spirit, or airy and animal *flatus* or blast, to be the immediate instrument of Sense, Pain, Motion, Pleasures, Agreement, Co-resemblance, Attraction, Repulsing, Convulsions or Contractions, Releasement also of any successive alterations whatsoever: so that it appropriates to self, sensible Objects, and from thence frameth unto it self Sensations themselves: For it happens, that if by chance that Spirit be busied by reason of profound speculations, or madness, that the body doth not perceive Pains, Hunger, Cold, Thirst, &c.

23 For I remember, that a Robber deluded the torture of torment, by a draught of *Aqua vita*, and a piece of Garlick; the which, he at length wanting, confessed his crimes.

But the astonishment and unsensibleness of the Leprosie, is in the habit of the flesh and sinewes, subjectively, or as in their Subject; but not in the compass of imagination; but effectively and occasionally in a certain poyson: But that bloody Anodynous or stupefactive ice, and well nigh mortifying poyson, is communicable and effluxive through a horrid and stinking Contagion, whence the holy Scriptures command the Leprouse to be severed from the company of men: But this icie poyson begins from without, and therefore they feel inward pains, and likewise external cold and heat; yet not wounds or a stork.

24 The Mange and Scab is manifold, and the Pox or foul Disease infamous through a defiling poyson: But they differ in kind, as well through the nature of the poyson, as the diversity of Subjects: For indeed, the Scab infects only the skin; so as that the skin cannot turn the nourishment designed for it self, into a proper nourishment; but it translates the most part thereof, into a salt and contagious liquor; to wit, the which, is of the property of an itchive and nettlie or hot stinging salt, &c.

Therefore scabbedness doth not require internal remedies, but only local ones, which are for killing of that itchive salt.

But the Pox doth chiefly affect the venal blood, with a biting, mattery, and putrifying poyson.

But the Leprosie doth chiefly infect the inflowing spirit, with an Anodynous icie poyson.

26 Indulge me Reader, that through the scanty furniture of words, I am constrained to use an illusion unto names: Because, as the essences of things are unknown to us from a former cause, and therefore proper names do fail those essences, we are constrained to borrow and describe the conditions of poysons in diseases, from the similitude of their properties: that if not, [by reason whereof it is] yet at least [because it is] the definition may proceed from Cousin-Germaine Adjuncts or Properties.

So, I say, that the Poyson of the Falling Evil, is a be-drunkenning, sleepifying, and also a swooning one, together with an astringency, neither therefore is it contagious, because intrinsecal, and not fermental: so the Leprosie hath an anodynous or stupefactive Poyson; not indeed a sleepifying one, but an icie or freezing poyson, well nigh mortifying, together with an infection of the sensitive spirit, and therefore mightily contagious, especially in a hot and sudoriferous or sweaty Region: For even as cold takes away the sense of touching, by congealing and driving the faculties inward; so also the Leprosie hath chosen to it self, and prepared an anodynous or benumbing poyson, not a coolifying and sleepifying, but by another title, a Freezing one; no otherwise than as Kibes or Chilblanes, are bored with Ulcers, as if they were scorched with fire: the which notwithstanding, do oftentimes happen unto those before or after winter, who all the winter in the Chimneys, felt no cold.

The poyson of the Leprosie therefore, doth in this respect, co-agree with cold, effectually, although not in the first Elementary quality thereof: neither therefore doth it also totally mortifie after the manner of a Gangreen; but only the part which it scaleth with the Ulcer: Yea, neither also doth it straightway extend it self far from thence, because it is from a constringent icie poyson, the Author of unsensibleness.

But it is of a difficult curing, by reason of its freezing, and almost mortifying Contagion, and that an oppressive one of the sensitive spirit; because as it is intimately co-fermented with the sensitive spirit, while it hath issued forth unto the utmost parts; therefore it is difficultly taken away, unless by remedies which have access unto the first closers or privy Chambers of us: to wit, that so they may confirm the spirit of life; whereby it may

may overcome the aforesaid poyson, and also confound or dissolve the ice of the foregoing winter with a new Spring.

And although that poyson be fermental in respect of the poyson; and therefore also from a formal quantity of it self, it endeavours to creep into all places afterwards; yet it is not apt, as to be co-fermented equally with the spirit, by reason of the force and fighting nobleness of the Subject into which it is received, and the drowfie sluggishness of its icie disposition.

For such is the difference in contagious things, that the poysons of some things do voluntarily, or by art, depart, and are separated from, and forsake the bodies infected by them: But of others, that there is no voluntary division to be hoped for: for the ice of the Leprousie doth the rather besiege the more outward parts, because it is an icie malady, and is thrust forth abroad by the in-bred heat: for therefore it more defiles the Standers by towards their outward parts, than their more inward bowels which are co-touching with them in the root, in the unity of life.

But no Physitian ever cured the Leprousie, which obtained not the Liquor *Alkahest*.

The which, since it is of a most tedious preparation, none, although skilful in art, shall come unto the obtainment thereof, whom the most High shall not by a special gift conduct thither: For he must needs be chosen and endowed by a particular priviledge, if he ought to obtain that *Medium* or Mean: To wit, whereby as well sensitive as unsensitive sublunary bodies, are equally pierced even into the seminal and intrinsecal root of their first Being; therefore also it subdueth and changeth all things under it, without a re-acting of the Patient and impoverishing of the Agent: For otherwise it is vain, whatsoever hope the Leprousie shall perswade it self of from elsewhere.

Therefore in times past, the curing of those that had the Leprousie, was granted for a sign unto the Messias alone.

My first born daughter being now five years old, became leprous, and that more and more; and at length, wan Ulcers, and horny white scales grew throughout her whole body. But then the image of the Virgin Lady newly shewed it self by many Miracles in our City, famous for the Hospital of St. James: The Girle therefore, being now seven years of age, desired to go to the place, and the Grandmother with her Nephew, hasten thither, and she returns after an hour, sound, and forthwith the scales fall off.

Presently after a year, the same Leprousie suddenly returned; And I confessed my self guilty, that I had concealed the honour of the Lady Virgin: Therefore my little daughter returns with her Grandmother unto the sacred Image, and she again returned healed, and so afterwards remained.

But I fearing the return of the Leprousie, divulged the Miracle, and by a publick Writing, confessed the favour and clemency of God: unto whom be all praise and glory, with the sanctifying of his name for ever!

I have already said, that sensation or the act of feeling, (according to the mind of *Hippocrates*) doth as well effectively, as susceptively or receivingly, consist in the Animal spirit: But because all such spirit is dead, and a dead Carcass, unless it be illustrated from the life it self: And because life it self in that spirit is not proper unto it, and unseparable from it, but life is from the vital or animal spirit, (I now confound them both in name) it being distinct in the whole subject; (the which elsewhere more manifestly, concerning long life) therefore first of all, it is manifest, that that vital spirit doth not immediately feel; but that it is the very life it self, which doth the more nearly and immediately feel, and grieve or pain in that spirit.

For indeed, I have demonstrated in the Treatise *Concerning the Forms of Things*, 29 that the life or form of things, is a certain light, a special Creature shining in its own Inne, throughout all the Guardians of the parts; yet that it is not a substance, nor an accident, however; by reason of the so great Novelty of the thing, the School of the *Peripateticks* may crack: Which Paradox, I have demonstrated by Mathematical demonstration, and Mechanically in the book of the Elements: And so I here assume it, as being elsewhere sufficiently proved.

I will therefore speak much more nearly than *Hippocrates*, concerning Sensation and sense; That if Sensation or the act of Feeling were in times past, said to be made with a passion of the body, wherein the spirit making the assault, receiveth the impression of the thing to be felt; and the which therefore is abusively called the very Sensible *Species* it self. We now understand, that this impression is in one only moment, and in the same point insinuated into the life existing in it: To wit, under which Insinuation, Application, and

Suiting, Sensation doth then first arise, being made in the life it self, and by the life ; Of which life indeed, Sense it self is an unseparable property.

And seeing Life is not of a body, nor proper to a body, nor lastly, of the Off-spring of corporeal properties ; but is a light coming into it by the gift of the Creator, beyond the condition of the Elements and Heavens ; Hence also, Sensation is not of bodies, nor of matter, nor of a solution of the Continual, &c. But plainly, a vital property proceeding from the very trunk of life.

As also, it is not sufficient, that there be an Eye, a Mean, a vital Spirit, that Seeing may be made ; but moreover, there is required an application of the visual spirit unto the Life, and therefore, the effect of seeing, however altogether ordinary, doth exceed the whole Elementary nature ; because it contains the image and co-resemblance of the Life it self : for that, Seeing, Tasting, Smelling, Touching, &c. are the immediate effects of the Life sporting it self or playing thorow its own Organs : For in all sense, it must needs be, that the allurements of the spirits, and the *Species* of things perceived, are fitted immediately to the life, if sensible acts do at any time happen.

30 But indeed, in a matter so difficult, and so far separated from the common Doctrine, grant me Reader, that I may as yet talk more nearly with thee ; For thou hast perceived, that it is not sufficient unto Sense and Sensation, to have have said, that the Brain, and likewise, the Sinew, is the immediate Organ of Sense ; nor also, that it is enough to have implored for this purpose, the inflowing spirit, yea, or the spirit it self implanted in the parts, as it is cherished from the influxing vertue of the brain or nerves, unless unto all these, the life shall concur ; For Sensation it self is of so great a weight, that it easily exceeds the compass of all Sublunary things, together with the whole power of the Heavens and Elements.

Therefore since thou hast already perceived that, I will speak further : For what things I have now spoken concerning the Life, I have shewen in my whole book *Of long Life*, (whereunto I dismiss thee for speedy recourse) how variously the Life glistens in nature : to wit, as it is feminally in the very vital spirits ; but as it were fountainously, in the sensitive soul it self.

31 Therefore in speaking properly of Sense and Sensation, the Sensitive Soul it self, is the primary, and also the immediate Being, which acteth all Sensations, and in acting, undergoes them in it self : And therefore the spirit of the Brain is only the immediated Organ ; but the life is the Organ or *Medium*, whereby the Sensitive Soul perceiveth external Objects rushing on it : For Sensation is not immediately in the thing contained, nor in the things containing, nor also in the spirit diffused through the Sinews into the vital parts : Because that spirit which makes the assault, differs from the Sensitive Soul, no otherwise than as a fat material smoak doth from the flame by which it is enflamed ; But the Soul, the immortal Mind, is wholly unpassable by humane conceptions, as it is the Image of the very incomprehensible God himself.

But the Sensitive Soul, although it begins in nature from an occasional seed, that is, dispositively ; yet seeing it is the nearest Image of that Image, it is also after the manner of men, unknown, and altogether scanty : For therefore indeed, neither can it be defined by
32 its causes, but only is described by an absurd or incongruous Circle of reflexions own its own actions and properties : To wit, that the Sensitive Soul is a formal light whereunto the properties of a Sensitive life do chiefly agree ; but in man, that it is the Prop and Inn of the immortal Soul, and its immediate bond with other created corporeal Bodies, besides it self : Therefore there is as yet a more remote aspect or beholding of the Soul, as being related to the life : Seeing life and the Soul are distinct things, as it were the abstract and the Concrete ; or rather as the property of a Being, and a Being it self.

33 This same Soul therefore, through life, perceiveth in the animal Spirits, and seeth immediately, in the Optick or visual spirit which inhabits in the apple of the eye, the visible *Species* conceived : For the Optick Spirit there, is a transparent glass, the light whereof is the very Sensitive Soul it self, present in the same place, being the Seat and Chambermaide of the immortal mind : Therefore there is no need of a recourse of the received *Species*, that are to be perceived thorow the Sinews, to the Brain ; But the Soul being immediately present, and bestowing all vertue from it self upon the visual Spirit, she herself fees and discerns.

But the Brain is only the Shop and Cup of those spirits : wherefore the sinews do not
34 serve for the conveighing of the *Species* drawn unto the Brain in the act feeling or perceiving ; But for bedewing of the spirits illustrated in the Brain, for the refreshing and confirming of the parts wherein themselves are implanted : Neither is there also altogether

then a like reason of the external Senses, with the imaginative power and its Sisters: For the sensible *Species*, outwardly perceived by the Soul, are abstracted by sensibility, and then at length, as it were of the matter [whereof] *Species* or shapes are from thence forged into the Image of the thing to be perceived.

After another manner, Sensitive Objects entering from without, are conceived after a Concrete or conjoynd manner, in the Organs of the senses, and therefore they do not only displease, but moreover, do now also pain.

But concerning the seat of the Soul, it is variously disputed for the Heart and the Brain: But I may suppose, that the Sensitive Soul is conformable to its own seeds, and by a real Act, distinguished from the immortal mind, the image of the Divinity: Yet that the Sensitive Soul (which is the carnal, old, Adamical man, and Law of the flesh) is not on both sides distinguished from a formal and vital light, neither that it first immediately in the inflowing Spirit, the which indeed, is wholly slideable and flowing: But the Spirit which increased in the Organs, presently after their first constitution, although it live in the last life of the seeds; yet it doth not as yet truly live in the middle animal life (which is the Sensitive life) until that a vital light coming upon it, shall actually shine.

The dispositions whereof, are indeed gradually premised: But notwithstanding they are in one only instant, enlighthned by the divine goodness of the Creator; Even as in the Book of long life: For that happens no otherwise than as in the co-rubbing of the flint against the Steel: Therefore an undeclarable light is kindled by the Creator in the spirit of the more noble Bowels: and first indeed in the heart; which light, as it attaineth strength by degrees, is more powerfully enlarged, no otherwise, than as the smoak of a lower Candle doth visibly receive the dismissed flame from the upper Candle: So that although the Organs are divided in diversity of Offices, yet by a mutual conspiracy, they readily serve for the necessities and ends prefixed by the Lord the Creator: Notwithstanding, there is one only Harmony, and continued Homogenial Life, and Sensitive Soul of all the Bowels and Members, which in every one of them receiveth, and presently after cloatheth it self with certain limitations or properties which it had prepared for it self by the seeds.

For as the flame of a Candle is not extended above or without its own Sphear, nor perisheth as long as it lives within that Sphear, although the smoaky fumes arising from thence, being void of flame, did fly far away out of that Spheare: so likewise, the inflowing spirits, although they are illustrated by a participation of life, are puffed away, do wander far, and therefore are materially diminished in their Cup or Buttery; yea, and for this cause, the liveliness of a vital Light growes feeble; yet nothing of the essence of the Sensitive Soul perisheth, because Life is not attained by parts and degrees, as neither doth it subsist like accidents, but is alwayes life; although more or less liveliness may appear in that light: For no otherwise than as a fire, where it is never so small, is as well fire, as another that is heightned: In like manner also, whatsoever exaleth from the body, which before rejoyced in the participation of Life, yet loseth life, so soon as it departs out of its own limits: So also Excrements do not indeed keep Life, but a co-participation of the vital spirits: Wherefore also from thence, the order of the inferiour Harmony slides into disorder, according to that saying, *My spirit shall be diminished, and (therefore) my dayes shall be shortened*: Therefore a more immoderate evacuation of corrupt *Pur*, and the like, brings sudden death: As indeed they do not contain the Soul, but only the last seminal life of vital spirits.

For as concerning the immediate existence of the immortal Mind or Divine Image, the matter is as yet in controversie between the Heart and the Brain: For I, who know, that even Quickning is made at the very instant, wherein the Sensitive Soul is present; that is, while that formal, Animal and Sensitive Light is kindled, (even as elsewhere, concerning the Birth of Formes) believe also, that the immortal mind is present, and that it doth wholly sit immediately in the Sensitive Soul, as being associated or joyned thereunto; Not indeed, that it sits in a certain corner bowel, prison of the Body, or shop of the spirits.

But I conceive, that the mind is throughout the whole Sensitive Soul, and that it pierceth this Soul; nor that it doth exceed the Sphear thereof, as long as it lives: and in this respect, that it is subject unto many importunities of circumstances: But in death the mind is separated; because the Sensitive Soul it self departs into nothing as it were, the light of a Candle; which things surely were here to be fore-tasted of, before the explication of Sensation.

Pain therefore, as that which is chiefly to be felt, shall open unto us the way: For it 16

is a hurtful and sorrowful Sensation or act of feeling conceived in the vital Spirit, being by life implanted in the sensitive soul.

And in speaking most nearly, *Sense or Feeling is a Passion of the sensitive soul, conceived in the spirit of Life*, For nothing can be glad, sorrowful or in pain, besides the soul itself: And so that Sense, seeing it is the first conception of Pain, or well-pleasing, it is by all means made primarily in the Soul: And therefore Sense represents unto me, nothing besides that power of the Soul of conceiving and judging passively of external Objects rushing on it.

Therefore seeing that these Acts do depend on the Soul, the whole History whereof is blind unto us; it is no wonder, that it hath been hitherto, nought but carelessly treated by the Schools concerning the Soul and Sensation; Because they are those who have skipped over the Enquiries of far more manifest things, as untouched; yea through sloath they have neglected them, by subscribing to the dreams of Heathens.

In Pain therefore, the irrational Sensitive Soul, is first or chiefly sorrowful, is mad, is angry, is perplexed, doth itch, or fear; and as it is in the fountainous root of all vital actions, it naturally moves, and contracts not only the Muscles, but also any of the parts, unto the tone of its own passions.

37 Sense therefore is the action of external Objects that are to be perceived; the which, while they are conceived in the Soul, it self also suffers, no less than life its companion, than the animal spirit, and the rest of the guard. But the immortal mind suffers not any of these things in its own substance, but only in its Subject, Seat, Inn, to wit, the Sensitive Soul: Otherwise, all voluntary things at once, are too invalid, so as to be able to affect an immortal Being, which is Eternal in its future duration.

38 But it is as yet a very small matter, that the Sensitive Soul doth suffer by sensible Objects, unless it self be made as it were hostile to it self, while, as impatient, it is exorbitant or disorderly: For it begins to act, while it is provoked, and doth suffer by sensible Objects: For truly it shakes the vital Spirit, and the whole body, and at length, as prodigal, it disperseth the vital furniture, and breeds diseases on it self, and hastens its own death.

That even from hence also, the Proverb may be verified, *That none is more hurt, than by himself*, (as the Sensitive soul is a meer act:) And so that it being once spurred up by sensible conceptions, (for it is wholly irrational, brutal, wrongful, and greedy of desire) it leaps over into furies, and symptomatically or furiously shakes all things. Therefore sensible Objects are the occasions of hurts and diseases: But the sensitive Soul well perceiving the same occasions, nor being willing to suffer them, diversly stirs up its own Ministers, and by Idea's imprinted on them, estrangerth them from their Scope or Purpose: From whence afterwards proceed various seeds and Off-springs of Diseases.

The Soul therefore undergoes and suffers the aforesaid affects from the Object that is to be felt, from whence it being disturbed or tossed by the pricks of Sensations, doth act, and suffer, lastly, as being prodigal, it in a rage, disperseth its own family-order of Administration: And while it perceiveth sweet, plausible, helpful Objects, and those things which are grateful unto it self, it is not in this its acts of feeling, differing from the Judgement whereby it feelth hurtful, corrosive, pricking, rending, bruising Objects, not but by accident, which is plainly external to the life it self: From whence, it is easily discerned, that Sense is made by the Judgement of the sensitive Soul, being brought upon a conceived sensible object, it altering at first by it self, according to the Sensation conceived, and then it conveigheth it further unto another imaginative Judgement, which is separated from the sensitive Judgement, no otherwise than as Sense, and Phantasie or Imagination do disagree in their Faculties, but not in their Subject.

Spafe me, ye Readers, if I attribute all material perturbations and affections, immediately to the sensitive soul, and to the spirits its guardians; but not unto the organs of those: For there are some tickling things, which by their itching, and itch-gumme, do stir up laughter, and a small leaping in some, which in others do not move the least of these: For oft-times the Soul is inwardly overclouded with a natural Sensation, and is also sadned, the Subject thereof being scarce known; yea, it elsewhere, doates: And elsewhere the sensitive soul becomes unsensitive, as in those that have the Falling Sicknesse, for a time: but in the Palsey, oft-times, for Life; at leastwise in Organs that are hurt, although as yet alive: But in many, without Sense, Judgement, and Reason, although the animal spirits do issue forth, and being diffused into the habit of the body, do move, and in the mean time, do otherwise draw hurtful impressions.

So the life, and that sensitive soul have their own drownesse, madnesse, and trouble within,

Within, although nothing shake and burden them from without : because seeing that in sleep also, there is its own foolish Lust or Desire, Hunger, Thirst, Fear, Agony, and a wondrous dissolute liberty of irrational vain dreams.

And moreover, friendly things are presently changed into mixt, neutral or hostile ones, as the *Archeus* which never keeps Holiday or is idle, doth of sweet things make bitter, and corroding ones : For the Soul (as I have said) conceiveth of *sensible things* by the means of a Guard and Clients, unto whom she her self as present, is an Assistant, and by applying those objects unto her self, stirs up Sorrow, Love, Fear, &c. To wit, of which Ideas, she sealingly forms the Characters or Impressions in her own *Archeus*, whereby she changeth all things according to the Image feminally proposed unto her self. Which Character, being through a bedewing of the Sensitive Soul, made partakers of Life and Sense, do first cloath the seminal body of the *Archeus*, from whence at length, most prompt faculties or abilities for action, do spring : And there is sometimes made in these, so ready and stubborn a perseverance of affection, that it presents a Spectacle of Admiration to the Beholder, especially, if any one doth examine the attributes of the Life and spiritual Seed : For how most suddenly are Children, Women, and improvident people, angry, do weep and laugh ? For the sensitive Souls of those, do freshly, as it were immediately even adhere unto sensible things.

It is therefore a natural thing, that the sensitive Spirit is voluntarily and easily carried into these kinds of overflowings ; because that Soul being easily received by its own sensual judgement, slides into the voluntary passions of material Spirits ; and, as even from a Child, these same exorbitances have encreased, so afterwards, that Soul grows to ripeness, as wrothful, furious, and wholly symptomatical ; the which otherwise would far more safely perform all things under meekness or mildness, than as by reason of furies to aspire into *Diseases*, and now and then unto its own death ; which is frequent and most manifest in Exorbitances of the Womb, and in the Symptoms of some Wounds, and of other *Diseases*.

Anger therefore and Fury in this place, are not of the man, but of that Sensitive Soul brought into the Life, which begetteth the animosities of a natural Sensation, and the which therefore doth oftentimes ascend unto a great height, that it burns to an Eschar, and blasts the part with a *Sphacelus* or mortifying Inflammation, like fire. Pain therefore is an undoubted Passion of the Sense of Touching, wherein the sensitive Soul expresseth a displeasure with the Object, according to the differences of the conceived Injury brought on the parts.

Furthermore, Whether that Passion be the Office or Performance of a judicial power, from whence the Soul is by a proper Etymology, named *Sensitive*, no otherwise than as the motive faculty moveth only by the beck of the Soul, without an external or foreign Exciter : Or indeed, whether pain be a Passion immediately produced from a sensible painning cause, the Schools might have sifted out, if as great a care of diligent searching into the truth, as of receiving a Salary from the sick, had ever touched them : But with me, that thing hath long since wanted a doubt.

For truly, Seeing the Sense of Pain, is the Judgement of the Soul, expressed by the act of feeling in the Sensible Faculty, whereby the Soul bewails it self of the sensible, hurtful, and painning Object : Therefore both of them being connexed together, do almost every way concur ; and both also stand related after each its own manner, unto pain. For indeed, the cause being a sensible injury, is the motive of pain : But the sensitive Soul it self, gives judgement of the painful Object with a certain wrothfulness and impatiencie of Passion : The which indeed, in a wound, Contusion or Bruise, Extension or Straining, Burning and Cold, as being external Causes, is altogether easie to be seen.

But while the motive Causes of Pain are neither applied from the aforesaid impression of external Objects, or from a proper Exorbitancy within, and the Sensitive Spirit is from thence made wholly sharp, gnawing, biting, degenerate, and forms the blood like it self : Then indeed, the Sensitive Soul, in painning, doth not only give a simple judgement concerning Pain ; But moreover, she in her self being wholly disturbed, brings forth from her self a newly painful product, no otherwise, than if that Product proceeded from an external occasional Cause.

And although both these do in a greater Passion, and more grievous Sensation, for the most part concur ; yet in speaking properly, Pain doth more intimately respect the Censure brought from the Sensitive Soul, the Patient : Or Pain doth more nearly reflect it self on the property of the Soul, than on the painning cause ; Because many are

grievously wounded without manifest pain : even as also a furious man shewes, that he scarce feeleth Paines from hurtfull Causes. Some things also do oftentimes delude the paines of Torture, and Unctions do also deceive paines, although the parts are beaten with injury. Wherefore Sense, doth more intimately and properly respect the Censure of the power of the sensitive Soul, than the injury of the painfull Cause. But truly, I am diverted elsewhere as for the cause of the aforesaid unpainfulness in the Leprosie, and unmoveableness in the Apoplexy, &c.

- 41 The *Schools* indeed, contending for the Brain as the chief Organ of Sensation and pain, do therefore take notice, that the Brain being by its own property of passion immediately, and as it were by one stroke touched, doth lose even both sense and motion at once : yea that it doth contract either of the sides. But the manner of making they thus expresse :

The fourth bosom of the Brain (it being a very small little bosom) beginning from the *Cerebellum*, the beginning of the Thorny marrow is stopped up by phlegme : from whence ariseth an Apoplexy in an instant. For Nature being unwilling, or not able to draw back or reduce that phlegme once slidden down thither, being diligent, is at leastwise busie in laying aside that phlegme into either side of that pipe : from whence consequently, a Palsie of that side begins. These things indeed we read concerning the Apoplexy and Palsie : yet nothing of the contracture arising through the stroke of the Head. *Paracelsus* also, not being content with this drowsie Doctrine of three Diseases, is also tumbled in unconstancy.

- 43 For sometimes he saith, That the Apoplexy and Palsie following thereupon, is bred, for that the sensitive Spirit in the Nerves or Sinews, hath from the Law of the *Microcosme*, after the manner of sulphurous Mines, contracted like *Aquaviva*, a flame from the fire of *Aether*. Through which inflammation, the Sinews and Tendons being afterwards at it were adust, burnt, and as it were half dead, are dried up together with the muscles : and therefore they do thenceforth remain deprived of sense and motion : To wit, he Constitutes these two Diseases (considering nothing the while, of the Contracture or Convulsion from the stroke) not indeed in the Case of the Brain, but in the utmost Branches of the Nerves : as though, they were affects hastening from without to within. But in another place, he judgeth not a certain sulphurous or inflamed matter to be the cause of the Apoplexy : but he accuseth *Mercury* onely (to wit, one of the three things, which he calls *His own Beginnings of Nature*) as being too exactly Circulated, and affirms, that through its abounding subtility or fineness, it is the containing Cause of every sudden Death. Elsewhere, he recalls the Apoplexy unto the Stars of Heaven : And in another place again, being unconstant, he reacheth, That every Apoplexy is made of gross vapors stopping up the Arteries and restless beating Pipes of the Throat ; and that there is also an Eclipse of the Lunaries or Moon-lights of the Brain in us, from a *Microcosmicall necessity*.

- 44 Therefore hath he in like manner, whirl'd about the causes of the *Vertigo* or giddiness of the Head unto uncertainties : To wit, himself being wholly Vertiginous. But I have otherwise proceeded : Whatsoever doth primarily feel, that very thing is the first Receiver, and efficiently effector of pain : But a Sword, stroke, bruise, Corrosives, &c. are indeed the occasional, or effective Instrumentals, but not the chief efficient of pain.

And then, seeing pain is for the most part bred in an instant, Also that which is stir'd up by external objects : Therefore for pain, there is no need of recourse to the Brain, that by reflexion it should have need as it were of a Counsellour. Wherefore, the *Schools* going back a little from the Brain, had rather receive the sinew for the chief Organ which is to perceive of the objects of Sense, as they are besprinkled either with a Beam, of Light, or with a material bedewing of Spirits (for they have not yet resolved themselves in most things) continually dismissed from the Brain : And so, that the Brain doth deny sense and motion to the inferiour parts, unlesse it doth unnecessarily inspire its own favour, by the Spirits its Mediatours. But herein also I find many perplexities.

- 45 First of all, I spy out divers Touchings in man : To wit, almost particular Touchings to be in all particular members : yea in the Bowels and other parts that are almost destitute of all fellowship with sinews. Such as are the Teeth themselves : the Root whereof although a small Nerve toucheth, yet not the Teeth themselves, more outwardly : The which notwithstanding, to have a feeling, many against their wills will testify : So the Urine-pipes want a sinew, and the Scull it self, under the boring of the *Chirurgians* wimble, refounds a wonderful sense, even into the Toes. I have believed therefore, that there could not be so great a latitude of one Touching, distributed from one onely and common Fountain, the Brain, or from the Nerve of a simple Texture or Composure. Therefore

Therefore have I supposed that which I have before already proved; That Sense doth chiefly reside in the sensitive Soul, which is every where present; and for that cause also, immediately in the implanted Spirit of the parts: And that thing I have the more boldly asserted, because the Brain itself, which is the shop of the in-flowing Spirit, doth excell in so dull and irregular a Touching, as that it hath been thought to be without feeling. Therefore, either that *Maxime* falls to the ground: *For the which things sake, every thing is such, that thing it self, is more such: or the Brain is not the primary seat and fountain of Touching.*

In the next place, all pain is made in the place, and is felt as it were out of hand. Therefore also, Touching is made in the place, and not after an afore-made signification to the Head. And moreover, in Nature, or at leastwise in a round figure, there is not right and left: and so that, neither can there be a side kept for phlegme in the Palsie, by its sliding down, except there are in the one onely Thorny Marrow, especially in its Beginning, two pipes throughout its length, conteining the necessity of a side: which is ridiculous even to have thought, especially in the slender hollownesse of the fourth Bosom. For truly, Motion and Sense are in one and the same muscle, which receiveth a simple and slender sinew: Yet in fingers that are affected with benumbednesse, the feeling only is oftentimes suspended, Motion being in the mean time safe and free: Therefore, either it must needs be, that Sense and Motion do not depend on the same Nerve, on the inflowing Spirit, and the common principle of these: or it is of necessity, that from the same one onely small Nerve, Motion onely, and not Sense, or Sense onely, and not Motion, hath its dependance; or that there are other forreign things hitherto unknown, which take away or hurt Sense onely, and not Motion: but other things which stop Motion alone, and some things which affect both.

Wherefore, in a more thorow attention, I have beheld that the astonishment of Touching, unsensiblenesse, want, or defect in Motion, were passions that sometimes arose from a primitive mean: and that those passions were then also, of necessity privative: As in the straining of a turning joynt, in strangling, &c. For I have known an honest Citizen, to have been thrice hung up by Robbers, for the wiping him of his money's sake; and that he told me, that at that very moment, wherein the three-legged Stool was withdrawn from his feet, he had lost motion, sense, and every operation of his mind. At leastwise, the fourth little Bosome of his Brain was not then filled up, nor the Thorny marrow pressed together, which lived safe within the turning joynts: and the Cord being cut, the stopping phlegme was not again taken away out of that fourth Bosome, that those Functions of his Soul and Body might return into their antient state.

A certain *Astrologer* being willing to try whether the death of hanging was a painfull death, cast a Rope about his Neck, and bad his Son, a Youth, that he should give heed; when he moved his Thumb, after the stool was withdrawn from under his feet, so as presently to cut the Cord. The Lad therefore fixing his eyes on his Fathers fingers, and nor beholding motion in them, and looking up vards, he saw his Father black and blew, and his Tongue thrust forth. Therefore the Cord being cut, the *Astrologer* falls on the ground, and scarce recovered after a month. Almost after the same manner doth drowning proceed: Wherein, as soon as at the first drawing, the water is drawn through the mouth into the Lungs, the use of the mental faculties is lost; and by a repeated draught of water, the former effects are confirmed: Yet neither do they so quickly dye, but that if they lay on their Face, that the water may flow forth, even those who appear to have been a good while dead, do for the most part, revive or live again. The pipes of the Lungs therefore, being filled up with a forreign Guest, the vital Beam perpetually shining from the Midriffes into the Head, is intercepted; From whence consequently, as it were a privative Apoplexy straightway ariseth. Surely, it is a wonder, that the Functions of the mind should on both sides so quickly fail; And so that also, a continued importunity and dependance of necessity, from the aspiring and vital favour of Inferiour parts, not yet acknowledged in the *Schools*, is conjectured: wherefore I have promoted a Treatise, concerning the *Dum Virate*.

I considered therefore, if the Brain be the chief Fountain and Seat of the Immortal Soul, understanding, and memory: at least, as long as the Soul was in the Brain, those faculties ought to remain untouched: Seeing that for Cogitation, there is neither need of the Leg, nor of the Arm, nor of Breathing. Notwithstanding, hanging doth as it were at one stroak, totally take away the faculties of the mind. For while the jugular Arteries did deny a community with the inferiour parts, or the Lungs were

filled up with water : presently, not onely the faculties do stumble, but also such a stoppage did act by way of an universal Apoplexy, and suspended motion not in one side onely, even as in the Palsie : For from thence, I confirmed my self, that the influences and communion of the inferiour Bowels were taken away from the Brain, by the interception of a Bond or Obstacle : From whence also, I consequently supposed, that the first Conceptions were formed elsewhere than in the Head, according to that saying of Truth ; *Out of the heart proceed adulteries, murders, &c.*

- 48 I found moreover, that the Apoplexy, astonishment or unsensibleness, Palsie, giddiness of the Head, Falling-Evil, Convulsion, &c. were passions arising from a positive occasional Cause, and much differing from privative ones, the Constrictives or fast binders together of the sinews, passages, and Spirits ; which Causes have been hitherto neglected by the *Schools*, by subscribing in the aforesaid Diseases, to wit, unto Heathenish Doctrines, stablishing phlegme in the fourth little bosome of the Brain : When as in the mean time, the like and positive faculties do every where occur in Opiates, and likewise in sleepey and Epileptical Diseases.

I remember also, that I at sometime in my young Beginnings, distilled some poysonous things : the which, if at any time the junctures of the Vessels being not well stopped, there expired an odour from them ; or that afterwards, in separating the vessels from each other, they struck me at unawares ; I was at one onely instant, ready for a fall, together with a giddiness of the Head, and a benumbedness of my right side : So that, if the Odour had once onely again smitten me, without doubt I had fallen, as being Apoplectical. Indeed, an ardent desire of knowledge in times past, constrained me into so great rashness, that a thousand times, I have not spared my own life. Therefore in the terms proposed, truly that Odour did not stir up phlegme threatening to slide down, and a new and fresh blast of ayr again removed it not out of the bosome of the Brain. Therefore, if some Simples do bring a drowsie Evil, giddiness of the Head, a cessation of Motion, and an obscuring of Sense : it is not unlikely, that the like things to these, do also suddenly spring up within : Neither is it seemly, alwayes to dedicate all these effects to the depriving stoppage of one phlegme.

- 49 For I remember, that a person being smitten with an Apoplexy, dyed in two hours : and seeing there was a suspicion of poyson offered him, a Dissection was appointed. His Scull therefore being taken away, thirteen studious men pleasantly took away the *Meninges* or Coates of the Brain ; and then the *Cerebellum* or little Brain being modestly opened, not any thing of phlegme was found in the fourth Bosome ; as neither was there any thing found to have fallen downwards into the Thorny Marrow, by those diligently narrow Enquirers. Therefore I shall never be induced to believe with the *Schools*, that the Apoplexy is a phlegmy stoppage of the fourth bosome of the Brain : as neither can I believe, the Palsie to be an obstruction of either side of the Thorny marrow.

- First of all, the unprosperous healing of these Diseases, do bewray the sluggish Enquiries into Causes. And then, the Apoplexy hath so negligently and ignorantly been handled hitherto, that it is as yet, in the *Schools*, destitute of a proper word : For truly, it hath retained its Name, from a folding, or small Net of Arteries, dreamed by *Galen*, or being delivered to him, being credulous, from some other ; which small Net, Anatomy hath not as yet hitherto seen. But *Galen* his feigned fine Net hath forsaken him, as a rash Asserter of Trifles, and a ridiculous Dissector. So that, it is now clearly manifested by *Andrew Vesalius* being the Author, That *Galen* never saw a humane dead Carcase dissected : and that he described his Doctrine of Anatomy word for word out of some other, no otherwise than as he did his *Herbarisme* out of *Diascorides*.

- 51 Therefore I have easily learned, that of necessity, not onely the place and manner of making, but also that the whole Tragedy, and due Remedies of an Apoplexy are wholly unknown in the Galenical *Schools* : For the method of curing it, hath confirmed that thing unto me : For I have often seen in a new Apoplexy, by Vomitive Medicines, but otherwise, comforting ones being afterwards added, the Speech, Sense, and Motion to be restored : But all, either side of whom had failed, I have seen cured by the *Mercurius Diaphoreticus* of *Paracelsus*, elsewhere by me described. For that *Sudoriferous Mercury*, as it cures without any Evacuation : so also, it hath brought desired help without the Revulsion of phlegme out of the fourth bosome of the Brain. For, I having followed the Doctrine of the Holy Scriptures (*by their fruits ye shall know them*) Have learned, To wit, from the latter, and from the effect, That the original of the Apoplexy is positive, but not privative, or by a stopping up of the bosome of the *Cerebellum*.

lun made by phlegme suddenly falling down thither : Especially, because that from affects of the Womb, Apoplexies and Palsies do oftentimes arise ; They ceasing, Remedies being administred to the Womb : and those being neglected, they are either choaked, as being truly Apoplectical, or do also languish with a Palsie for their life-time.

Finally, I have known, that the entry of an Apoplexy is in the Midriff ; but in the Brain, not but by a secondary passion, whereby the Brain doth successively hearken unto the Government of inferiour parts : For neither do vomitive Medicines, as neither also the aforesaid *sudoriferous* one, withdraw any thing from the hinder little Bosome, and much lesse, from the hollownesse of the Thorny martow. And that thing, they have known, as many as have ever been present at the Dissection of those parts. And likewise, *Odoriferous* and succouring Essences being drunk, should never be derived unto the Head, if it were stopped or belet : yet they do presently, sensibly help ; Because there is in the Midriff their own taste, and their own proper smelling : And moreover, their own touching also, is from hence communicated to the body, by meanes of the sensitive soul being every where present : Which thing, although I have elsewhere, sufficiently proved concerning long Life ; yet it shall here be profitable to have confirmed it, at least by one Example : Therefore, if any one shall drink a Scammoneated poyson masked with sugar and spice, the Tongue and Pallat do indeed commend it for the first turn : but at a repeated one, the horrou of the Midriff, and aversnesse of drinking, will discover the error of the masked tast : And that which otherwise is sweet to the Tongue, is made horrid to the Midriff. Its no wonder therefore, that there is a singular Tast and Touching in the same place, and that it is from thence diffused into the members : and that those Senses of the Midriff are presently refreshed by the Essences of the Odour : but slowly and never, if they are applyed unto the Nostrils, Pallat, and seames of the Scull.

For I have taken notice of some things, which cause not onely the drowfie Evil, or Catalepsie, but also foolish madnesse, and which prostrate the most potent or chief Dignities of the mind, yet the Sense and Motion being unhurt : But after that the understanding returns, indeed as well Sense as Motion are abolished. Some things also, being outwardly anoynted on the Body, do take away the feeling, so as that there is a liberty for the Chyrurgion in cutting : and the Oyntments being afterwards withdrawn, the expelled feeling retutneth.

From hence indeed, I have believed, that the Apoplexy, drowfie Evils, Falling-sicknesse, and likewise stranglings of the Womb, and any Swoonings, are Diseases arising from a secondary passion, and action of Government : but not from a corporall confluence of humours and vapours bred in the bottles of the Brain. Truly, the Womb never ascends above the *Diaphragma*, but it causeth Apoplectical Affects. There is not therefore, a material Touching of the Womb and Head : For I have known a Perfume, whereby a Woman suddenly falls down as Apoplectical, together with the Palsie of her side, and she remains such, unlesse she be restored by the Fume of a *Horse-fg* sent thorow by a Funnel to the Womb. For I have seen also, the Circle of the neck in a Woman to have suddenly ascended above the height of her Chin, the which is subject neither to humours nor vapours : For truly there is an aspect of the Womb ; as it were of its own Basilisk : whereby the parts, by the afflux of the *Latex* (but what that *Latex* is shall be taught elsewhere) do swell ; even as is otherwise, proper to many poysons : Even so as the waters do ascend and swell, at both stations of the Moon, from the aspect of the Star alone.

I will decipher my own self in this respect. While I was in the 65 Year of my age, and was greatly occupied about the consideration of the Apoplexy, I discerned, To wit, that a positive one which should be made by a freezing poyson, had it self in such a manner, as that it could be known from another which afflicts by the stopping of a sinew : Even so that he, who sitting with his Leg Retorted or writhen back, loseth feeling in that Leg, by reason of a pressing together of the sinew : and while as Sense is restored unto it, that Lancings or prickings are felt from the vital or animal Spirit ; (which is Salt, as I have shewn in the *Book of long-Life*) but from an astonishment, which proceeds from a freezing poyson, if the feeling shall return, no pain of lancing or pricking offers it self. For I contemplated in my study, under the cold of the *Calends* of [the 11th. Month called] *January* : and an earthen Pan laden with a few live Coals, stood aloof off, whereby the most chilly cold season of the *Winter* might at least be a little mitigated. One of my Daughters seasonably coming to the place, sented the stink of the smoak, and presently withdrew the Pan ; But I forthwith perceived a fainting to be sorely threatened about the Orifice of my stomach : I arising therefore, and going forth in one instant, I

fell with a straight body, on a stony ground: therefore, as well by reason of the swooning; as of the stroak of the hinder part of my head; I was brought away for a dead carcase. I returned indeed after a quarter of an houre, unto the signes of life; but together with a swelling of the hinder part of my head; I felt the seames or futures of my scull notably to paine me, and that more and more: My tast also, and smelling to have been wholly taken away, and my eares continually to tingle. Moreover, at every of my conceptions, my head presently whirled round with a giddinesse, even my eyes being shut: straightway after, all my sinewes even unto the calves of my legs ached, so as that one only sneezing cruelly launced the whole body: indeed an appetite of eating, returned, but a whirling round exercised me for some months.

But I learned first, that in the evening before supper, the giddinesse of my head increased, to wit, about the bound of digestion.

2. That my judgment remayning, the giddinesse notwithstanding, was prevalent.

3. That from any kind of pot-herbs, and unsalted fishes, the whirling did the more cruelly, assault me.

4. I noted the *Gem Turcois*, to have remayned entire or neutral with me, having fallen, nor to have preserved me from the peril of falling: And that the *Turcois* doth not help any but those, whom a sudden fear in falling, surpriseth: The which happens not in those wherein a swooning precedes, and frameth the fall.

5. That my giddinesse was from meates subject to corruption.

6. And I seriously noted, that the *Apoplexy*, *Vertigo*, &c. do depend on the midriffe, although from the shaking of the stroake, my head alone seemed to be affected, and the *vertigo* did sensibly whirle about in my head. Yet seeing the giddinesse had respect unto meates, and a plenty of meates, I remarkeably perceived, that presently after the aforesaid swooning, a guest besides nature remayned about the stomach, being the occasional cause of the aforesaid giddinesse or *vertigo*, and that thing, I the more strongly confirmed, because as oft as I had in times past, sayled over the sea, I indeed, at the beginning of stormes, grew nauseous; but I never vomited, or desisted from eating: but after that I wandred about on Land, I always perceived an unconstant giddinesse, night and day resembling the motion of sayling upwards and downwards: Untill that I was alwayes at length freed by a vomite of white Vitriol. For at least wise, in sayling, there was no offence brought unto my head: yet, as if I had been drunk, I threatned a fall with a continual giddinesse, the operation of my judgment notwithstanding, remayning constant and unhurt. But I was always freed from that giddinesse, by one onely vomite. But now, in the aforesaid fall, the stroake indeed produced a tumour in the hinder part of my head, and in the seames of my scull, bewraying its effects in the organs of the senses and nerves.

But all these did least of all cause a wheeling about of my head, the which I observed to be chiefly stirred up or exasperated from the choice of meates; Most especially, because that whirling was restrained according to its custome, by one onely vomite.

From whence I experienced in my self, that the giddinesse of my head, although my head was hurt, was stirred up and nourished by the stomach, and so from the *Dumvirate*: But that the swooning it self gave a cause of the stroak, and also left a sealing mark in a forreigne guest there detained.

Again, that that whirling was not from a vapour lifted upwards from beneath: but from the corporeal occasion of a sealed excrement, as oft as something offered it self which was the lesse pleasing unto those inferiour shops, the force and impressive *Idea* of the same, redounded into the braine. From thence therefore I discerned, that be-drunkning things being derived from the stomach into the arteries, and co-mixed with vital spirit, did confound the family-administration of the spirit in the little cells of the Braine, and also disturb the imaginative power; because they actually proceeded through the arteries upwards, as forreigners and strangers: to wit, by be-giddyng things whereby indeed, whirlings only, how cruel ones soever, were presented, the understanding remayning safe. For the occasional causes also of these whirlings do remaine in the places about the short ribs: from whence, they by the power of government, vitiate the Brain it self: but not the abstracted faculties of the mind which are immediatly sealed in the spirits.

Even so as the *Elf's hoofs* being bound to the finger, restraines the same rigour of the *Dumvirate* in those that have the falling sicknesse. I also well weighed, as it were by an Opticall inspection, after what manner the first conceptions, might be formed in the midriffs

midriff, and from thence being sent unto the head polished. And at length, after what sort these midriffs might be diversly tossed in dotages, and Hypochondriacal madnesses, without any running round of the head. And, how in drunken persons, a whirling might accompany their foolish madnesse. But elsewhere, after what sort a whirling of the of the head might induce no stumbling of the minde: Even as otherwise, how the memory might stumble, the man remayning safe and sound. Truly as I seriously, and with much leisure, weighed these things with my self, I found, that qualities do follow their own *Idea's*, and by course act their own tragedies in the excrement themselves: to wit, which diverse properties of qualities I then at first clearly apprehended to be as it were seminal endowments, and true formal *Idea's*: whereby indeed, the strength of the sensitive soul (for why, they are companions of the same formal order) was vitiated, and variously subdued, and yielded to the importunities of active *Idea's*.

Alasse for grief! then the bottome of the soul (so called by *Taulerus*) manifested it self unto me, which was nothing else but the immortal minde it self; to wit, in what great utter darknesse, it might be involved, as it were in coates of skin, as it was fast tied to, and entertained in the Inne of the very sensitive soul, while the terme of life endures.

And so from hence I clearly knew him, whom I have also therefore (con- 55
cerning Long Life) by an unheard word explained, to the honour of God, the contempt of Satan, and the Magnificence or great Achievement of the whole Perigrination of man.

I have also taught concerning *Long Life*, that the Head is the fountain of the growth of the parts placed under it, (which thing Crump-backed persons do also confirm,) and so that from the head, the State and Duration of Growth is limited: That bounds also are described by the hairs, and therefore that heads void of care, do scarce wax gray.

I profess therefore with the Schools, *That a vital Light is indeed diffused from the Brain, as from a fountain, and dispersed through the sinews; and that, that Light being absent, the faculties that are silent in their proper Inns, are also straightway silent through a privative occasion*: For although Sense and Motion do after some sort, depend as well perceptively as executively on the implanted spirit of the parts: yet because all particular parts are vitally nourished by a besprinkled light of the Brain; The Thred also, or Beam of this Light being intercepted, Sense and Motion likewise are as soon as may be, intercepted.

But these things do shew only a privative Apoplexie, not indeed so truly a Disease, as an accidental one, even as I have shewn above, in the *Straying of the Turning-Joynts*: But not that therefore, the fountainous cause of the Senses and Motions in the spirit, dieth with that privation, although the functions thereof be suspended, while that Light from above is suspended: For a Fly doth sometimes frequently flie, when his head is taken off: Also the Head of a man being cut off, his joynts do oftentimes, for a good while, leap a little, and are contracted, and do as yet afford the signes of an in-bred motion.

But of a positive and disease Apoplexie, there is a far different cause and property: 56
For now and then a depriving of Sense and Astonishment straightway lights into the palm of the hand, or into the one only finger; the motion thereof, notwithstanding, remaining safe. Doth therefore Phlegm, a forreigner to that finger, fall into the middle or pith of the sinew? To wit, by a pipe, wherewith the small Nerve is throughout bored thorow, and conspirable with the Brain? Or perhaps, doth an unwonted Vapour of Phlegm run down thither? and the which otherwise was wont, or ought to climb upwards, the nature of Vapours so determining, and by a vital violent force, obeying.

But at leastwise, one only Nerve extended into the Tendon of the Palm, bestowes Sense 57
and Motion on the four fingers alike: Why therefore is the Feeling alone stupified in one finger only?

Again, What Vapour being ever lifted up even from the most tough snivel, was grosser, or not equal to that which ascends from the water? Let as many as have been Distillers in the Universe, answer. Why therefore shall a gross Vapour of Phlegm (the which I have sufficiently demonstrated elsewhere to be a non-being) be required for an astonishment, and not that of simple water, or of the blood? But if indeed a Vapour of the latex or blood, shall effect that thing, then also there shall be a necessary, ordinary, and continual general stupefaction of all parts without intermission. And then, if some forreign or excrementous humour or vapour be the occasional cause of such an
astonishment

astonishment, to wit, the privative, and stoppifying one of a nerve, surely it is sent, or runs down thither of its own accord: If it be sent, yet at least, not from the Brain, or the marrow its Vicars; For so it should not straightway affect, as neither, at leastwise, strike at one only finger, and the utmost part of the finger, which was but presently before, healthy: Neither is that Vapour sent from the spirit, the Family-administrater of Life, because it is that which should more willingly and readily go forth, as being banished by transpiration: Therefore that thing manifestly contradicteth providence, and a natural care of diligence, which alwayes dispenfeth all things for the best end: Because nature as too injurious to herself, should dash against the sinewes, those things which she according to her wonted manner, had more easily, better, and more nearly commanded away unto the natural and ordinary emunctory of the skin.

58 And so that vaporal Fable of the Schools, which is to be scourged, contains a manifold impossibility: For the Pipe of the Sinews ends into the thorny marrow with a straight thred, and a continued passage; neither hath it any transverse trunks, through which it should transmit that phlegmatish vapour sideways (for otherwise, there would be made a total loss of the spirits, before they could come down unto the Muscle, the Executer of Motion) so far is it, that it should suck the same vapour that way. That Humour or Vapour therefore cannot be transmitted or descend unto one only finger (and much less suddenly leap on it) unless through a passage of the sinewes, common with the thorny marrow.

59 But it is like to a dream, that in a sound body, but not in a complaining one, the sense of a finger doth forthwith fail through phlegm, which was not before perceived in the more nigh sinews; or otherwise, by a Vapour bred after an irregular manner, being not dismissed, or descending thither, as neither presently bred in the part; when as otherwise, all hospitality of a forreigner, is even from the beginning manifestly troublesome to nature.

But hath that Phlegm, or that Vapour perhaps, crept sideways into the utmost nerve of the finger? But then the Maxim of the Schools should perish, which ascribeth the dispensations of any Humours unto the Spirit making the assault: For those Humours are not in us, or in the nature of things, and if there were any, an ambulatory or walking power should not therefore belong unto them; and much less, in those being now excrementitious; because all natural motions in us, hearken unto the faculties of vital things: For if Phlegm, and the gross Vapour thereof were in nature, at leastwise in this place (as they are disease) they are reputed by the Schools to be Excrements, whereof there is not a going, nor voluntary Motion or Progress: Therefore they should of necessity be driven away by some other: Not indeed, by the *Archeus*, who seeing he acts all things, and that well, should not therefore drive that unto the sinews, which he was otherwise accustomed regularly to drive unto the skin. Doth therefore Phlegm, perhaps being extenuated into a Vapour by heat proceed upwards; But then, not downwards into the steep finger: At leastwise, according to the Theoreme of the Schools concerning Catarrhs, That Vapour should presently again grow together into drops; but it should not wander about in the shew of a Vapour unto the utmost parts of the Nerves, as neither should it hasten through the Palm of the Hand, unto one only finger. But why should it rush on a sudden, like a weight, into a small nerve more slender than a thred? Into one I say, and not into another?

But if the Vapour doth enter sideways, why in one only instant is it imbibed, without a foregoing trouble? Why is it not rather dashed into the flesh, than into the extrem part of a small nerve, which is encompassed with its own membrane? Why doth the cause which begat one only Atome of Phlegm, or of a gross vapour, continually produce no other besides that one only Atome? For that sudden stupefaction doth oft-times begin from the little finger, and ceaseth at length in that, when it hath reached to the third or fourth. Now and then also, all the fingers do suddenly assume the paleness of death, unto the half of their length, or beyond, even when it is without astonishment, a drowsie motion, &c.

If therefore that were from a vapourie matter, at least, that matter shall not be made in the brain or thorny marrow: For truly, then also it should portend an universal passion; Therefore that Vapour shall be bred in the sinew or tendon; but then they would be all stupified at once, but not successively.

Neither am I perswaded, why that Vapour existing without the sinew in the tranquility of health, should be pressed inwards unto the sinew or tendon, when as after another manner, there is in us an uncessant transpiration outwards: At leastwise, why this should

not

not continue, seeing it hath the same Workman, Matter and shop within it? Wherefore doth that astonishment presently cease, if a matter should subsist, such as should be one of the four Humours everywhere swimming together with the venal blood?

If the cause now defluxeth from the common Nerve of the Palm of the hand, into one finger already vanquished; Why therefore doth it afterwards flow down unto another healthy finger, and not stay in the first? Why if it be propagated from one only little Nerve into all of them, doth it not also molest all of them at once; but subsequently, and a good while after? Wherefore is the feeling hurt, and not the motion, if they are from one only and a like cause, if it be brought down through one only small sinew, the Author as well of Motion as Sense?

The cold of the hands alone causeth an astonishment from without, and a pain within, without any falling of vapours or humours thereinto. At length, the sinews are not inserted into the fingers, but into the tendons: Why therefore is the feeling hurt, and not the motion? Why is not the Stupescation extended throughout the whole palm of the hand at once, which is covered with one tendon? If the Tendons suffer this threatened Palsy, now that is to have departed from the communion of the Nerves unto the thick, not bored, nor pip-like trunks of the Tendons: Not passable ones, I say, if therefore not subject to the Incidencies of Phlegme.

A certain man had retained his Spleen affected from a Quartan Ague, and likewise a stupescation of his left hand, together with a mortal paleness frequently returning in haste: But what community of passages doth the Spleen hold with the Nerves of the fingers? to wit, that it may transmit Phlegm and gross Vapours unto the fingers alone? For doth the Milt send vapours into the Brain, which with the substitution of authority, and action, it will have to be from thence assigned unto the fingers of its own side, or unto those opposite thereunto? Shall therefore a stopped Spleen evaporate more unto the Brain and Marrow of the back, than an healthy one not being hindered and burdened with continual black Choler?

Certainly I have prosecuted the unsensibleness and astonishments of particular members, that we might the more rightly understand a total Apoplexie.

In the mean time I pity the Schools, that they have not more exactly examined their own fictions of Humours and Vapours, and the so speedied and ridiculous falling down of these; neither that they have once considered, that as the cold of the encompassing Air is stupefactive; so that they have not distinguished the nature of the Palsy, and the col-like positive passions of the sinews, from col-like privative ones: That from thence they might have learned, that positive effects can in no wise consist without a stupefying dead matter and quality: The which if it be sufficient for creating an astonishment, when it shall have touched at the Sensitive parts from without; what may it not be for effecting, if it locally stir the sinew it self. Truly, if that which toucheth thereat in manner of a Vapour (according to the Schools) shall presently afford an effect about to perish the Senses; Why have they not likewise once considered, that through a more tough matter, it shall be able to stir up a stubborn and durable Palsy?

Moreover, Wheresoever such an anodynous matter is enclosed in the *Dumvirate* of the body (I understand the Stomack and Spleen) it shall stir up a sudden swooning, and positive Apoplexie.

But the Palsie is for the most part, only of one side, and a defect invades as it were with the one only stroak of a dart: But the swiftness of the unexpected chance produceth a terrour in the brain and marrows; that is, in the spirit the inhabitant of these, and the Author of that act of feeling: Therefore by reason of its Terrour, the weaker side of the marrow is contracted: but surely, the Palsy is the Product of the Contracture: And in all, one side is always weaker than the other.

Therefore women, who as they are for the most part of a timorous mind, they by terrour do frequently rush also into a Palsy, without an Apoplexie: For Terrour or Affrightment hath that Property, that it straightway closeth the pores, if it shall be sudden; And the hairs hath stood an end, and the voice hath cleaved to the Jawes: Because it is natural for the gate to be shut against an approaching enemy: For in a stroak of the Scul, the side placed under it is resolved, and the opposite side is contracted: To wit, the Supposite one is resolved, because it is more terrified; and the Opposite one is drawn together, because provoked.

And indeed the Vulgar are wont to fore-divine an Apoplexie from the shortness of the neck: For the shortness of the neck doth not argue the fewer turning joynts to be, but a less depth of every one of them: But what hath that Common with Phlegm?

B b b b b

or

or with a sometimes future stoppage of the fourth bosome of the Brain? To wit, that one ought to be casually presaged by the other: For the shortness of the neck containeth not a naked sign, or prediction of Physiognomy: But besides, a certain occasional cause: For oft-times, after yesterdaies gluttony or drunkenness, a giddiness of the head, a dizzie dimness of sight, vomiting, astonishment of the fingers, &c. do happen; the which threaten and presage an Apoplexy, not indeed through occasion of a fit Organ (as concerning the shortness of the neck) but because they have their beginning from an Apoplexy, differing only in degree and intensness.

If therefore that giddiness and astonishment (after surfeiting) be from the Midriffes, as the occasional matter is as yet nourished by the Archeus in an inferiour degree: Therefore, wheresoever that Anodynous or stupifying poyson is carried up into a degree, it causeth an Apoplexy natively arising from the same seats, where through an error of the sixth digestion, that Anodynous poyson is made of the nourishment, from whence at length, there also is occasionally a Palsey.

The shortness therefore of the neck affordeth a brevity and readines of passage from the Midriffes into the head, requisite for an Apoplexy, that is, a more ready aptness of the Organ.

65 And also the Schools affirm, that in little and threatned Apoplexies, instituted rubbings of the utmost parts have sometimes profited, and they from thence conjecturing a revulsion of Phlegm, and Vapours of out the head, do command frictions or rubbings, even unto a cruel pilling off of the skin, and sharp Clysters: To wit, they excoriate the skin, that Sense or Feeling may not fail in the same place.

66 They being in the mean time forgetful of their own rule, that Sense depends wholly on the Brain; and that it is in vain to pill the legs, that they may revulse Phlegm out of the fourth bosome of the Brain; For they know not whither they may pull it back; whether they ought to allure it out of the bosome of the *Cerebellum* into the fundament, by Clysters: or indeed, whether they may by rubbing, require the same out of the bosome of the *Cerebellum* through the skin: All being ridiculous, because themselves also are ridiculous.

In the mean time, let those that stand by me, testifie, whether they can detract rather the skin, than vapours: Yet I certainly know, that though any one be wholly flead, the Apoplexy, or true Palsey, is notwithstanding, never in anywise to be removed.

67 Neither do I see, after what manner they can defend their own Theoreme: To wit, that Phlegm in the fourth bosome of the brain, is the containing and adequate cause of both these evils: For I confidently deliver, that frictions have little profited, where that stupefactive and deadly poyson was only in the habit of the body: but what will those cruel frictions do, if that Anodynous poyson be primarily seated in the Midriffes? and after what manner do they prove, that by rubbings, Phlegm is drawn out of the bosome of the *Cerebellum*? I know therefore, that frictions, as they were instituted without the discerning and knowledge of causes, and distinguishing of places; so also that they have been, and will be alwayes in vain: For it is a ridiculous and cruel thing to have rubbed the skin unto a fleaing thereof, and to have assigned the cause, to be a stoppage in the middle of the thorny marrow: Because how much rubbing soever there shall be, if there were any Phlegm in the world, and that slidden into the aforesaid bosome of the little Brain, it shall never take that phlegm away in one only grain: But rather those superstitions being granted, it should continually increase the same: Because Revulsion (if there be any truth in it) shall draw the matter rather downwards, and dash it into the pipe of the thorny marrow in what part it is alwayes made narrower than it self; and so much the rather, because there is ordinarily a dispensing of the greater vessels into the inferiour and lesser branches of them: Then also, because that Phlegm being sequestred from the rest of the blood, should be a meer excrement, nor therefore discussible without a dead head, or residence, far harder: And therefore rubbing, if it do draw, and revulse after any kind of manner, it shall feel also that ordinary endeavour of nature, that that stopping Phlegm should be drawn, not from the hinder and lower bosome upwards to the brain, by a retrograde motion: but unto the more straight and lower trunks of the *Nucha* or marrow of the back: Especially, while as in the Palsey, the sensitive spirits flow down sparingly, or plainly nothing at all, the which might otherwise be able to drive that Phlegm forth.

69 Rubbing therefore, as it exhausts it shall rather encrease a want of the sensitive spirits. But the Anodynous poyson of an Apoplexy, is generated after the manner of other natural ones; to wit, a certain excrement occasionally growes in the proper Conduit of

5. Every sinew is therefore marrowie within : but without, it is covered with its own little membrane.

6. The Thorny Marrow is believed to be passable through its middle as long as we live ; whereby the motive Spirit is dispensed , and equally extended throughout the length of that Marrow and the Nerves. For that its own vital light beaming forth, brings down the command of the Will, or its beck, unto the Muscles, the executive Organ of that motion which the Soul voluntarily proposeth to it self.

7. The Command of the Soul is *instantous* ; not indeed, that the Spirits, as being ennobled with the Characters of a Command , do run down (suppose thou in one that playes on the Harp) at all particular moments of motions. For although motions may happen to the administering Spirits, yet the obediences of these should be too slow. Wherefore the command or beck of the Soul is brought down in an instant, onely by a beam of Light : Even so as the Objects of sight are even at a far distance , perceived in a moment.

8. Seeing there is no Sense, or at leastwise a dull one, unto the Brain , but a most acute one unto the Coates thereof : therefore the light of Sense defluxeth not through the marrow and central substance of a sinew, and its Trunk : but the sensitive Soul beams forth Sense, and is especially communicated from the Coates of the Brain through the membranes, the coverings of the sinews, unto the parts co-touching with, and being the annexed Clients of the Nerve.

9. Therefore the light which beames forth unto the Guardians of Sense and Motion, is formed in a double substance, and by a double beck, sensitively. From hence it comes to pass, that Sense is hurt, Motion being safe ; or on the contrary, by reason of a diversity of participated light brought down through divers Organs. Wherefore the most High is never sufficiently to be praised, who hath placed so Noble Faculties in the Membranes of the Brain, Stomach, and Womb, containing the Life, Soul, and the whole Government of man in them ! For if there be a fundamental verity of *Palmeftry* and *Physiognomy*, there are Lines, as well in the forehead as in the hand, which do sometimes portend an Apoplexy to come : But such a Signate is from the thing signifying, which naturally constitutes us : But the *Archeus* of the Seed cannot fore-know those effects ; especially those which are to arise from a contingent Chance (to wit, if anger, an inordinate life, and the too much use of Tobacco, shall afford the Beginnings of an Apoplexy) Therefore at least, it must needs be, that the Beginnings of an Apoplexy, are not from a privative cause, if they are concealed in the Seminal Beginnings themselves, and are at sometime to break forth at the time of their own maturity : which is to say, that the Apoplexy doth actually lay hid in the *Archeus*, or Seed, after the manner of Hereditary Diseases : and so also, that it thus makes an assault through whole Families. At leastwise, be it known, that an Apoplexy is not a stopping up of the little Bosome, made by phlegme, as neither a privative effect : but that it consists of true and Seminal Beginnings : But the stopping phlegme (if there were any in man) or the stoppage depending thereupon, doth not fore-exist in the Seed ; and much lesse should it be fit to delineate in the Young, so late monstrous effects. And so, they most remotely exclude phlegme sliding into the fourth Bosome of the Brain : And by Consequence also, the *Universities*, who have been hitherto ignorant of the Disease and Remedy thereof.

In the next place, Neither is it to be understood, by what meanes, or middle distance, Nature could so detain the phlegme (a disobedient and not vital excrement) on the one side onely of that small and most narrow Bosome , that it should never issue unto the opposite side, through its own heap, and fluidnesse of moisture : Yea, when the Palsie is in the right side, the laying down, is then alwayes on the left side : therefore it should be impossible, but that, that phlegme should soon fall down into the left side, and extinguish the sick party himself, or at least, beget an *Ambulatory* or shaking Palsie. Why at length should that little bosome expell that phlegme alwayes unto the right or left side, but never forwards or backwards ? Especially, because in Nature, there is not right or left : but all things, in respect of the whole Body, are round : whence it is manifest, that in the very Organs, to wit, in the vital *Archeus*, but not in the feigned phlegme of that bosome, there is hid an effective reason, why the *Archeus* being Apoplectical, doth alwayes bend the Palsie its Lackey, unto the side : but it is a mockery, whatsoever the *Schools* have dreamed of the fourth little bosome.

The whole reason of Truth therefore depends in these same Diseases, as the *Archeus* forms and perfects a Seminal Idea ; the which he for the most part, finds somewhat cadaverous

verous or mortified in meats, and the transmutations of these. For then he causeth giddinesses of the head, and the more rough ones, if the same thing happens in the excrements, in the passage from Food into nourishment: and that Apoplexy is most exceeding readily inclined, which forms it sealing Idea in the very *Archeus* of the *Duumvirate*; Because the whole *Archeus* in the Bowels, is straightway as it were mortified.

- 80 At length from sundry particulars laid down, I conclude, That an Apoplexy is in no wise a privative Disease, and that the stoppages of the sinews do far differ here-from, as in the writhing or wresting aside of the turning Joynts, in hanging, &c. Also that neither of them doth arise from an obstruction of the fourth bosome in the *Cerebellum*, at the beginning of the Thorny marrow: But the Apoplexy is generated occasionally from a poysonous stupefactive and mortified beginning of matter fore-conceived in the Midriffs: The which, when it hath in the same place attained its perfection, and requisite maturity, it infects the *Archeus* of the place, which presently, for that very cause vanquisheth, and sore troubleth the powers of the Brain: but not that the Brain doth primarily labour, and draw the parts put under it, into the conspiracy of its own Death. But that the Palsie is a
- 82 Contracture of the sensitive parts, caused by Terror alone. But that thing is manifest in particular resolvings of the members; To wit, wherein the local Generations of the afore-said Apoplectical poyson are made.

- 83 Furthermore, the *Schools* have made mention of one onely Anodynous poyson, which is sleepifying, stupefactive, and distinguished onely in degree, between *Opium*, *Mandrake*, and *Henbane*; not that they therefore deny, although they pass by many others in Simples. For there are some, which in a small space of duration, do take away Sense, and the health of the Mind, Motion being left, even as in affects of the Falling-sicknesse. Some do overshadow or Eclipse the Motion onely, others both, and very many also do befool, Sense and Motion being left: Neither therefore are they to be named: even as, neither others, which are bedrunkening ones. But besides, the humour that is to be assimilated unto us, is easily infected from the Image of a mortal Anodynous poyson of the *Archeus* conceived in the Midriffs, wherewith a various condition of poyson is co-bred for Company, and is frequently beheld in the Plague: But elsewhere, it strikes not the head, but is sealed in the habit of the body; where also now and then, the freezing poyson of the Leprosie, is bred by the same priviledge of degenerating; But a stupefactive poyson in the *Duumvirate*, violently dejects the Brain, and according to its difference, generates giddiness, the Falling-Evil, Heart-beatings, Swoonings, *Catochus's*, and the Apoplexy; and as fears of the parts, so also Palseys accompany this Apoplexy. But out of the *Duumvirate*, it mortifies its Seat with an astonishment, and a cold Gangreen, &c.

- 84 They therefore notably err, who are busied in restraining madness by *Opiates*: seeing every *Opiate*, is in it self mad, because madness is nothing besides a waking Dream. For truly scarce a ten-fold Dose of *Opium*, procures sleep to a mad person, but in a lesser Dose, nothing is effected: But if indeed through increasing of the Dose, sleep creeps on the mad person, it shall now increase the waking sleep, and divers unlike vanities of
- 85 vain Dreames. But sleep coming on a mad man of its own free accord, hath deceived the *Schools*: For that, as it proceeds from a good cause, so also as a fore-running Betokener of health, it promiseth that the madness will be solved. Add thou, that in *Opium*, besides a sleepifying, there is another poyson connexed: whence deadly *Poppies* for sleep, are much sung of by *Poets*.

- 86 But in the *sulphur* of *Vitriol*, there is a Sugary sleepifying Being, which brings on sweet sleep, together with a restoring of the principal Faculties. There is the like in *Sulphur*, for which things sake, it is commended in affects of the Lungs, if it be so prepared, as that it may be able to play together with us. Sleep that brings labour or trouble (such as is from *Opiates*) is evil: Which poyson denotas sore disturbances and Tempests: Therefore sweet sleep creeping on the party, is to be dedicated unto favourable Causes. Therefore (I will say it again) the Apoplexy, Falling-sickness, *Coma* or sleeping-Evil, giddiness of the Head, trembling of the Heart, &c. have their own singular, and those anodynous poysons. The Vertigo indeed doth sometimes prostrate a man, like the Apoplexy, but without a Palsie: Because it hath not a Cadaverous stupefactive poyson, but a bedrunkening one, such as is in Tobacco: But if it shall become the more hurtfull in degree, number, or quantity, it is also made apoplectical.

But moreover, concerning *Garlick* and *Aqua vita*, I have spoken, and of the unsensibleness thereof: yet it is not apoplectical, because a poyson, and constant Root is absent. At least, by way of impertinency, I will add to this:

That

of the matter, But the *Archeus* perceiving that excrement, and abhorring it, flees from it, and conceiving the deadly Idea of the Excrement, impertinently imprints it on himself: From whence an Apoplexy is forthwith stirred up, as it were with the stroke of a dart: But some previous dispositions do for the most part go before the nativity of this stupifying poyson.

The which therefore, if it should happen in the Brain, the place should cease from complaint, to wit, because the Apoplexy is made in an instant, wherefore we call it [*Den Schlag*] or a stroak, indeed because it suddenly comes as at unawares after the manner of a stroak. The place therefore of the nativity of an Apoplexy is in the Midriſſs, and therefore it hath also the foreſhewing ſigns of giddineſs of the head, of benumbedneſs, nauſeouſneſs, &c. The place therefore of an Apoplexy is in the *Archeus* of the Midriſſs: but in every of the parts, for a particular aſtoniſhment: becauſe through the error of Diſteſtion, the Liquor that is immediately to be aſſimilated, by reaſon of the defect of the *Archeus*, degenerates into an Anodynous poyſon, and is made the occaſional matter of ſo great a malady; an excrement, I ſay, being ſealed by an Idea of the abhorring *Archeus*, is ſealed on the dreg, who is to ſhew forth an equally aged memory of his own hoſtility. But that it doth not depart from thence, nor obey Remedies known by the *Apothecary*, the very *Quartan-ague* teacheth; the which, hitherto repeates its Tragedy at pleaſure, to the diſgrace of *Phyſicians*. If a *Quartan-ague* be incurable by the *Schools*, much more an Apoplexy. For the ſtupefactive poyſon of an Apoplexy, is milder indeed in it ſelf, than that of the Falling-ſickeſs: but it far more cruelly moleſteth with its invaſion. For beſides aſtoniſhment, it ſtrikes the mind, begets a deep drowſineſſe, and a *Carochus* or unſenſible detainment. But if beſides, it alſo attaines a ſharpeſſe, it produceth malignant Ulcers, according to the mortifying of the Anodynous poyſon. But becauſe that poyſon is brackiſh, therefore it threatens *Atrophia's* or Conſumptions for lack of nourishment.

For I have obſerved a Chymiſt, who had been a good while occupied about *Aqua Regis's*, to have fallen into terrible beatings of the Heart; at length into paines of his armes, and his mouth was pulled on the right ſide; he ſuffered alſo reſtleſs nights, and deep paines of his armes: the which notwithstanding, were not exaſperated by touching. He had alſo conſumed with a notable leanneſs, by reaſon of the conceived brackiſhneſſes of the waters: in the mean time any the more external Remedies were attempted in vain (for neither did I ſpare coſts, or ſervice for him) but he being fully reſtored by a *Laudanum* onely, for thirteen dayes adminiſtred, ſoon after recovered the habit of his body, and former ſtrength. For becauſe the harſh brackiſhneſs of the Liquors had defiled the ſenſitive Spirit, the product whereof pierced the *Archeus*, his mouth being pulled together unto one ſide, and his fingers being writhed ſide-ways, reſembled a certain Apoplectical Being; But becauſe it aſcended not from the Governour of the Midriſſs, but onely the Odours of the waters had immingled themſelves with the inſlowing ſenſitive Spirit, there was not a perfect Apoplexy of that man, although otherwiſe, one giddie enough.

But becauſe I call that a brackiſh Anodynal or ſtupefactive, which in *Opium* is a bitter one, but not in *Henbane*, or *Mandrake*; and a very ſweet one in *Vitriol* and *Sulphur*: This firſt of all diſcovers the Errors of the *Schools*, while as from commonly known Savours, they divine of the faculties of Simples: But indeed I know, that the interchanges of things, or the maturities of days are not yet digeſted: nor likewise, That Truth inſtead of falſhood, will pleaſe every one: therefore I will ſubjoyn ſome Anguiſhes, which the Apoplectical Rules of the *Schools* have brought forth unto me. For while I inſiſted more than was meet, in the examination of Minerals, I felt from the Fume of ſome of them, an Apoplexy to be at hand, with a defect of my left ſide, and ſo that I had fallen headlong down, if I had as yet but one onely turn breathed in the ayr of that place. Wherefore I learned firſt of all, that the Paſſie is not more latter than an Apoplexy, in duration. Then again, that there is no ſtoppage in the boſomes of the Brain: For I was already almoſt proſtrated, and unleſſe I had turned away my head, from whence the ſtinking, cruel blaſt breathed, I, as Apoplectical, had ruſhed down; and I was ready to fall. And then, my arm did already decay, and my leg being ſtupified, failed of ſenſe and motion. But the *Schools* will never answer to theſe particulars: if nothing of phlegme had ever fallen into the fourth boſome of the Brain, how was the effect in me before its Cauſe? But if any thing thereof had fallen down, which had at leaſt, ſtopt up the half of its Boſome, which way retired that phlegme ſo ſpeedily? Or why is not every Apoplexy likewise, by the ſame endeavour, voluntarily cured, the phlegme which is the Effectreſſe thereof, vaniſhing? but if they had rather privily to eſcape, that my Apoplexy came from the miſchievous vapour,

and not that to be from phlegme. At leastwise, why was that cruel Fume brought sooner unto the fourth Bosome, than unto the former ones, and those nearer and more obedient unto the Nostrils? unlesse perhaps the former were Leprous, and sluggish, and without Sense? Yea, all the sinews which are deputed unto the Senses alone, receive their sensitive spirits from the former Bosomes: But in the former Ventricles of the Brain, there was no sign of the hurting of Sense: yet there is no coming from without, unto the fourth Bosom, but through all the foremost ones. Sense likewise (except that it was the more dull on one side) and motion remained, and also a Judgement perswading a departure. Therefore had the phlegme waited now for some years at the coast of the fourth Bosome: that the Odour of that Fume being once repeated, it (the signe as it were of a Trumpet being given) might rush headlong into the pit? Why therefore fell not the phlegme
 74 down in me a leaping Run-away? For in the Falling-sicknesse, the chief powers of the Soul, and Senses on both sides go to ruine, motion onely surviving, when as notwithstanding every sinew, even that which is dedicated to motion, feebleth: Therefore the Brain, and all its Bosoms ought to be affected on both sides, where the more internal senses, together with the more external ones, are laid asleep as if they were extinguished; How therefore doth motion alone remain? After what manner, in the Falling-Evil, Apoplexy, and Palsie are the senses laid asleep; when as in the Apoplexy and Palsie, the Organ of motion onely is besieged, for one half? They will say, that in the Epilepsie the foremost parts of the Brain do suffer, but the hinder ones remain safe.

First of all, Why therefore are the joynts contracted, if the Organs of motion are free? The memory is especially hurt in the Falling-sickness: shall therefore that also be onely in the forepart of the Head? But that which is required being granted: why therefore hath every sinew designed for motion, leaping through the Thorny marrow, from the hinder part of the Brain, lost Sense, but not Motion? Therefore the Brain in the Falling-Evil is sore smitten, as well behind as before, by Midriff-Causes. For oft-times some one that is about to dye, doth as yet feel or perceive, speak, and hear, motion in his lower parts being taken away a good while before, by the displayed sinewes of the Thorny marrow. The Brain being in good health, a sudden swooning oft-times rusheth on one from the lower parts, and as well Sense as Motion, failes in one onely instant. If that be made by Fumes, Sense ought first to fail, and afterwards motion, by degrees: Because the foremost Bosomes of the Brain are nearer to the mouth of the stomach, than that last very slender one is: And that thing should happen altogether most slowly, if the Apoplexy were from a stoppage.

Again, In most sharp gripings or wringings of the Bowels, the Joynts are drawn together, with an integrity of the Functions of the Mind, yea and without a pain in the Head; the which presently after, in the Palsie, are for the most part, at rest. Doth therefore the pain of the Belly stop up the Beginning of the Thorny marrow, without an Apoplexy? To wit, so as that often-times, both the hands and feet are resolved, and deprived of motion. Is now therefore the fourth bosome of the Brain stopped on both sides? Why are the Joynts onely deprived of Motion and Sense, not likewise the intermeduating Organs, begging their own Sense and Motion from the same Journey, mean, and middle space? For what affinity is there of a Bowel, with that last bosome of the *Cerebellum*? Or what agreement of this bosome, with the utmost Joynts? To wit, that these should pay the punishment deserved from elsewhere? For it is not yet sufficiently manifest, seeing Sense and Motion are made in one onely Nerve, yet how in most, either of the two may be hurt, the other being safe.

Wherefore I as the first, ought to clear up this Question by Positions.

- 75
1. The Brain doth not feel or perceive by it self, scarce in it self: But it is covered with two membranes, of a most sharp sense: so that there is every where a very sharp sense, and a majesty of great Authority in the stomach, womb, Coats of the Brain, Intestines; To wit, in naked membranes, &c.
 2. The Correlative thereof is; the Animal Spirit, as long as it is formed within the bosomes of the Brain, or wanders, it feebleth not, neither is the Brain made a partaker of Sense thereby.
 3. That Spirit receives not Sense from the Brain, seeing the Brain it self wants sense. And by Consequence, neither doth the spirit receive the last power of its perfection and Sensation, in the bosomes of the Brain.
 4. The Thorny Marrow in its inward kernel, is the continued substance of the Brain, and is therefore cloathed with a membrane, continual with the *Menynx's* or Coats thereof.
 5. Every

That Anodynes things, although they stupifie like cold; yet that they are erroneously placed by the *Schools* among things that are cold in the highest degree. 87

And moreover, neither is the sleepifying *sulphur* in *Opium*, cold: but it is exceeding bitter, and the salt thereof is sharp and Sudoriferous: But bitter things in the *Schools*, are notably Hot. Therefore the sleepifying matter as well in *Opium*, as elsewhere, is a power and specifical Gift of the Creatour, but not an effect of Cold: Even as I have elsewhere professedly manifested concerning sleep. 88

But the stupefactive poyson in the Epilepsie, differs from an Apoplectical one: because, in the chief part of it, it is a be-drunkening one. Spare me Reader, for that I denominate the faculties of things from the similitude of Simples, for truly, proper Names are wanting; as also the knowledge of Properties from a former Cause, which ought to dictate Names. 89

After the Treatises of unsensibility, of Anodynes things, and of some poysons, pain is to be re-sumed by me. I repeat therefore, *That pain and sense are made immediately in an injured place, or Center, a consent of the Brain being not required.* For it is sufficient that the vital Light of the sensitive Soul it self is diffused into all parts on every side, according to the requirance of necessity: For any Ruler of parts, ought also to be a Noter and Discerner of Objects: Because it hath the Soul on every side present with, and President over it. For after what sort shall the Soul manifest, that it feels things hurtfull, unlesse it shall stir up a pain or averseness, from thence conceived in its injured Center? The Spirits therefore, inserted in the Joynts, ought readily to serve the necessities of the Members, without consultation, and recourse had unto the Brain: seeing not the Brain, but the Soul it self, being every where present, doth immediately feel. For there was need of excessive swiftness for the averting and preventing of hurtfull things: therefore to send a Messenger unto the Brain, had been inconvenient. I grant indeed, that the pain of the Intestine draws other parts into a consent, and resolves them either with a stubborn Palsie, or contracts the parts serving for voluntary motion, that the Kidney being pained, the stomach is nauseous, and begins to vomit, the Bowels are writhed, and the Thigh placed under it, is astonished: That the Nail of ones Hand paining, stirs up a remote kernel. For truly, the presence of the Soul confirmeth, but doth not take away a consent of parts. 90

Therefore that consent in paines, is forreign unto pain, and by accident: neither therefore doth it touch at, or estrange the essence or cause of pain; Because that Consent is latter unto pain, and therefore also separable from it. Therefore all the particular Spirits of the parts, do feel, without the commerce of the inflowing Spirit; As in the Teeth, and in new flesh being restored in a hollow Ulcer. For because the parts do on both sides live in their own quarter, Sense is according to the diversities of the Organ; and therefore there are many paines con-centred in Seasons, and they answer unto the unequalities of the Moon, because they are centrally received in the Spirit which is *Astral* unto us. 91

Again, Neither the venal blood, nor the very blood of the *Arteries*, are strong in Sense and an animal Touching, although they being even hunted out of the Vessels, do Sympathetically feel; because they flourish onely with influous Spirit. Therefore it hath been hitherto questioned by *Divines*, whether the venal blood be informed by the Soul? I suppose therefore, under the Correction of a better Judgement, *That nothing is informed by the Soul of a living Creature, which doth not partake of the sensitive Soul; that is, that nothing is informed by the Soul which doth not feel by the Spirit implanted and quickned in the parts:* Because informing argues of necessity, life in the living Creature: as also Life argues a sense or feeling, at least a dull one, such as is in the Bones and Brain. But if indeed, meates in the stomach, an abounding of Seed in the seedy Kernels, Hunger, yea and the Urine, do produce their own dreams in the Soul, and stir up the Soul under sleep, according to their pleasure: Yet it followes not from thence, on the other hand, That therefore the Soul informeth the food or the urine: For although the Soul shall feel urine abounding and pressing it; yet this urine doth not feel its own Objects. For the Soul also, feels a pricking Knife, the which notwithstanding, it doth not inform. That therefore any thing may be informed by the Soul, it is necessary, that it lives and feels as it were the Subject of the life it self. 92

Sense therefore, and pain are in the parts or things containing, subjectively: but in those contained, objectively onely. Yea, although things contained are intimate with us, and after a most near manner, vital; yet in respect of their being things contained, and of the sensitive Soul, they are as it were external. 94

95 Notwithstanding, it is not sufficient to have said with the vulgar, *That a hurtful cause is painful*; yea, nor is it sufficient to know, that the Sensitive Live doth primarily feel, and from thence the spirit implanted in the parts, and at length the stable Organs: and so indeed that the Sense testifies of the presence of that which is hurtful; seeing these things, the Schools and the common people have after some sort known: But it ought more manifestly to appear, what may immediately cause pain, and after what sort Pain may be made in feeling.

As to the first, a Needle pricks, and from thence is pain. A little Bee stings, and wounds like a Needle; But both of them do pain after a far different manner: Therefore the solution or dividing of that which held together, it self, (otherwise common in both prickings) doth not primarily cause pain: For truly, the dividing or that which held together, effects no other thing, in respect of it self, than a Non-solution: The which in leprous affects and in the Palsey, is without Sense and Pain: But if indeed the solution of the Con-tinual, causeth pain, or doth not, that is to the knife by accident, neither doth this touch at the Solution primarily, except in the condition of an occasion, without which it is not: therefore because the stinging of a Bee causeth another manner of pain than an equal solution that is made by a Needle, surely it dependeth on a more piercing judgement of Sense or Feeling: And so it is even from thence, presently manifest, that the Sensitive Soul it self doth immediately feel, censure and judge of the Object of Pain.

But Sense in the Schools, is said to be made passively, even as motion, actively.

But I have already shewn, that Sense is made by a power, or by a primary sensitive Being, through action; Although the Members do suffer subjectively, through the application of sensible Objects: Therefore Sense or Feeling is made actively, because the Act of feeling it self, is an active censure of the Soul.

97 But in as much, in the mean time, as the members do suffer, seeing that is unto the act of feeling by accident, it cannot hinder, but that feeling is made sensitively. There is indeed the same proper agent in that sensitive action of Sense and Pain, because the Agent it self, is the Soul: And Sense or Feeling differs from pain, by the judgement of the Soul concerning sensible Objects: And so Sense is of the Soul it self; to wit, its action, but not its passion.

98 The Schools indeed have known with the common people, that violent causes do bring on Pain, even as also that the water is liquid; But to have shewn the internal animosity or courage of the sensitive faculty, and to have manifested pain in the root, that they have not yet hitherto been intent upon. To which end, the following consideration doth conduce.

99 Live flesh is most easily scorched, and is excoriated or flead by boyling water. But dead flesh is the more slowly burnt: And there is a different scorching, if a live hand, and that of a dead Carcase be burnt: For truly the former burning stirs up bladders with the least fervency of heat, so as that the same happens even under the Sun; But the latter burning parcheth the flesh, no otherwise than if it were roasted: namely, without little bladders and excoriation.

100 The Schools also have not yet registred that difference, because neither have they heeded it.

And perhaps they will say, that it is more easie to make hot, things already heated, and that therefore, live flesh is the more readily burnt. But let us suppose dead flesh to be first made lukewarm, and to be in the same degree of heat, no otherwise than if it did live; yet it is not therefore easily scorched or burnt, nor after the same manner wherein live-flesh is: Therefore the aforesaid evasion hath no place: Wherefore seeing that from the agent of a single degree of heat, divers operations do happen in the same subject of flesh, being distinct only in life: Therefore it must needs be, that the life is the only cause of that diversity: which is to say, that the life is the proper agent of Sensation in Sensitive Creatures; and that the life is such a cause, which besides, hath a power of making burnings or scorchings in live bodies, and in the matter of Medicine, yea also of resisting, or not; Wherefore I find Life to be the first or chief, and immediate Efficient of Sense and pain.

101 For truly, the force of fire being received and introduced into a dead Carcase, is not to be felt; yea, neither properly is it a Scorching or burning one, such as is in live bodies, but rather a roasting and parching one: For in live bodies, the liquor of flesh, is through an indignation of the Sensitive Soul, most speedily converted into a sharp liquor, and substantially transchanged: the which in dead bodies is not subject unto a vital transmutation

tion: And so, by boyling and frying, it parcheth and roasteth fleshes between the *Fibers*.

For flesh that is dead suffers by degrees, the which, other bodies not sensitive, do suffer after a single manner from the fire: But in live bodies, even boyling water presently produceth bladders, and then the solid part is swiftly contracted and burnt.

Therefore that action of scorching or burning in live and sensitive bodies, is made efficiently by the Life it self, but by the fire, effectively, by way of an active, occasional, and external mean: To wit, the life it self, feeling the rigour of the fire, sharpens its own liquor, and transchangeth it into a bladdering one, and afterwards into an Escharrorick liquor. And as much indeed as is snatched by the fire, so much afterwards is by a disposition that is left, corrupted, because it is dead: But because of sensible things known by Sense, touching is the chief Judge, therefore a demonstration hath scarce place, and the history and root of pain by its causes, hath hitherto remained neglected: Therefore I will repeat some things, which in so great a Paradox, I wrote before in a more contracted speech.

Wherefore for the searching into the proper agent in pain, I have considered, that *Frogwort*, *Smallage*, *Scarwort*, &c. do not embladder in a dead Carcase, yet they embladder live flesh; I judged therefore, that in the very sensitive soul the difference of this act consisted, and not primasily in the Scarwort: Because it is that which embladders only so far as by a biting more sharp than is meet, it thus molests the Sensitive spirits, the which, that they may mitigate, blunt, or extinguish the perceived sharpness, the soul rageth in them, and therefore resolveth the proper vital substance of the members into a corrosive liquor: (even as elsewhere concerning the Plague) wherefore the sensitive Soul it self, as it is the immediate sensitive substance, so it is the efficiently effective cause of the bladder: But the Scarwort which operates nothing in a dead Carcase, is the effective, occasional, external, and excitative cause.

By reason whereof the Schools being astonished, have taught, that Medicines are wholly sluggish, and as it were dead, unless they are first prepared by our heat, as it were by a Cook, and being stirred up, are sharpened thereby: The which thing surely, wants not its own perplexities: For they have determined of that very thing, as Medicines being assumed or applied, should not forthwith display their faculties on us like fire; but as they should have need of a certain space of time wherein they might produce their own effects by foregoing dispositions; notwithstanding, if a space be required, that an alteration may made, which is the effect of the medicine; Surely, that not any thing proves the action of a Medicine otherwise necessary, to be from our heat, that the Medicine may obtain the gift of its own nativity, or a liberty of acting, the which it obtained safe, full, and free to it self by Creation.

But (as I have said) it operates after another manner, yea oft-times, a far other thing in live bodies, than otherwise in dead, or unsensitive ones: And so the effects of Medicines are not wrought, unless they are first duly applied, and afterwards by a more exact appropriation, they do imprint their power on us, to wit, that from thence a disposition may arise, which the sensitive soul stirs up by its own judgement, and afterwards also unfolds, and perfects.

For the Schools have erred in Medicinal affairs, because they have beheld external and occasional causes for principal, and vital ones: Therefore they have neglected to connex in live bodies, and in cures themselves, things effected, unto their proper efficient, by the due journeys of degrees: Wherefore be it a foolish thing, that Pepper, Vinegar, &c. ought to borrow their activities and gifts received for acting, from our heat: As if one only heat should be the primary cause of so many-form effects: Because in very deed, that a thing may act on us, it hath no need of another forreign thing out of it self for this purpose; but as primarily, so it without delay presently uncloaths its faculties by the moments of dispositions, if it be duly applyed, (even as I have demonstrated at large, as well concerning the action of Government, as in the Treatise, that heat doth not digest in sensitive Creatures.)

But because the sensitive Soul (which the Schools shamefully confound with heat) applyeth the received faculties, and from thence frameth a certain new action proper to it self, and wholly vital: Therefore the faculties which the Sensitive soul receiveth from the medicine, are the effective and occasional causes only, and it might if it would, pass by, and neglect the same.

The which is manifest in the more strong persons, who digest laxative medicines, even violent ones, without trouble, and drink being in vain, as if they were foods: And likewise in dying persons, unto whom indeed, there is an application of Medicines, but

- not an appropriation, to wit, by reason of a neglect and defect of the sensitive power: For in the more strong folks, an exciting heat is not wanting, and yet there is no effect:
- 107 For otherwise, the vertues of a Medicine are presently received, and do proceed by degrees more and more, and then those powers being received into the sensitive Soul, this sensitive Soul presently behaves it self well or ill toward them: If well, then it useth its own Objects for the cherishment of their powers, or for the vanquishment of that which is hurtful: But if amiss, now the sensitive life carries it self foolishly, furiously, angrily, vexingly, &c. And it spreads the seminal Idea's of these Passions on the assaulting spirit, on the blood, and on the Organs affected by the Medicines, and effects remain agreeable unto the aforesaid Idea's.
- 108 The which, in the Treatise of Diseases, and likewise concerning the Plague, I have evidently demonstrated. And so if a delay interposeth between a Medicine being applied, and the effect of the same: that never happens by reason of a defect, or requirance of an activity of the things; but it happens by reason of the necessity of a vital activity, issuing, and following from the impression made by the Medicine: For a poysonous power is not wanting in the stroak of a Serpent, although it sometimes doth not operate, by reason of an impediment: For an Agent, that it may act on us, stands in need of an application, of an appropriated impression, and of a sensitive power, as it were the receiver of another acting power: And that, that it may bring forth a Product, which in very deed, and immediately, is a new, or vital fruit, as a testimony of the sensation or feeling act of the soul. For thus many do so accustom themselves to laxative medicines, that at length they operate nothing at all; not indeed, that heat failed in the man, or that the laxatives have lost their former faculties; but the soul hath contracted a familiarity from the frequent use of them, so that it is at length the more mildly wroth with those poysons, than at their first turnes.
- 109 For truly, in this respect, it is true and perpetual, that all sensation consisteth rather in a vital action and judgment, than in passion: whether in the meane time, that sensation shall happen in the more external sense, or in any passion of the mind; or in the next place, in the natural or Sympathetical sense of inanimate things.
- 110 At least wise it is manifest, that medicines do not want a foregoing heat of ours, that they may simply act: but the sensitive power which is the principal actresse, hath need of acting and sensible objects that it may feel, and in feeling, may act: And therefore the action of sensible things, hath it self on both sides after the manner of an occasional cause in respect of the sensitive soul; neither therefore do medicines operate in a dead carcase, by reason of a want of the principal and immediate agent which is the life, or soul.
- 111 Whence also it is sufficiently manifest, how disorderly the faculties of medicines have been hitherto attributed unto the agent, or vital, and principal efficient; and how neglected the principal agent hath stood, as well in the healing as in the effecting of diseases. Truly if otherwise, a medicine ought to be actuated by our heat as such every medicine should equally act always, and every where on every humane object that is actually hot; no otherwise then as a certain weight is always, uniformly, of equal weight with it self: But a laxative medicine being administered in the same dose, looseth in one, terribly, but in another, nothing at all: Yet it is on both sides sufficiently stirred up by heat: Yea, the same medicine for the most part rageth on the weaker sort, which in the more strong is without an effect. But that which I have said concerning *Coloquin-tida*, *Scarwort*, *Frogwort*, &c. Is also to be drawn promiscuously, unto other agents.
- 112 Yea, bright burning iron burnes a dead carcase, although not after an equal manner as it doth a live one: For in live bodies it primarily hurts the sensitive soul, the which therefore being impatient, rageth after a wonderfull manner, doth by degrees resolve and exasperate its own and vital liquours into a sharp poyson, and then contracts the fibers of the flesh, and turns them into an escharre, yea into the way of a coale: But a dead carcase is burnt by bright burning iron, no other wise than if wood, or any other unsensitive thing should be: That is, it burnes by a proper action of the fire, but not of the life.
- 113 For this prerogative the Schooles have not heeded, the which one only prerogative notwithstanding, is considerable in the Entrance of healing: But they according to their own manner, have considered only the proper action of the fire, even as also the abstracted powers of medicines. *Calx Vive*, as long as it remaineth dry, it gnawes not a dead

dead carcase : but it presently gnawes live flesh, and moves an escharre. A dead carcase is by lime wholly resolved into a liquour, and is combibed, except the bone & gristle thereof: But it doth not consume live flesh into a liquour, but translates it into an escharre. In general therefore, the sensitive vital power, is first affected by a sensible object : and from thence it at length frames an effect, or a new, that is, a proper Being, According to the passion conceived after the manner of the hurt or injury figured to it self : And this effect is proper to the sensitive soul, but mediate, in respect of the occasion exciting.

Consequently also, seeing pain consisteth subjectively in the injured and provoked part, but in the life, as in the first feeler, being troubled, judging, and displeased, as the primary agent ; I have accounted the essential diversity of paines to consist immediately in the affect of the motion of the soul :

To wit, that pricking, lancing, and walking paines, are bred from mixt affects, which proceeded from wrath and fear, or from agony. Truly, I took diligent notice, that there was a contracture almost in every pain ; So that, a hurting occasional matter being offered, the hurt part, being as it were presently drawn together, and co-wrinkled by a cramp, manifesteth its own pain : For nature is every where so prone to a Cramp, that no man is about to do his easement, whose cod, how loose soever it was, is not crisped and co-wrinkled. For by reason of the natural avernesse of the implanted spirit, from a payning object, pain hath continually a crisping of its own member, as it were a companion.

There is also moreover, a stable pain in a part, even as in an ulcer, wound, Impostume, &c. But this rageth from an only and meere indignation : For this doth not so properly contract it self, even as in convulsive paines : but it melts its own nourishable liquour, and changeth it into a sharp salt, a poysonsome one, and at length through an induced naughtinesse, translates it into an embladdering or escharring one. There are besides, some blunt, deep paines, modestly gnawing, and the more stupide ones, and the which are exorbitant through an error of the digestions, having followed rather a foolish wrathfulness, than the fury of the life. Therefore all paine is caused occasionally from a sorrowfull affection of objects : But it proceedes immediately, from the life it self, as it were a testimony of sense.

Yea, pain doth often denote the passions of the sensitive soul for a proper destruction of organs : Because that soul laies hold on those parts being badly affected, rising up as it were from a proper vice of themselves, and as if they murmuring, it endeavours to correct, chastise these parts, and oft-times also, to destroy them.

Therefore in the termes proposed concerning the disease of the Stone, the womb of *Duelech* moves at first, great paines only by a convulsion of it self : the which at length, become more mild unto those that are accustomed thereunto, to wit, by reason of a less indignation of the soul. For from hence, children make water afar off, but old folkes, nigh ; Because the bladder of children being impatient of the pain conceived from the retained urine, naturally contracts and presseth it self together : But the bladder of old men being now the lesse sorely smitten with the accustomed chance, suffers the urine of its own free accord to slide forth ; otherwise, the muscle of the bladder being loosed, there is no reason why children do pisse far off, and old folks nigh, unless the already said childish contracture of the bladder, and painfull, and voluntary pressing together thereof behind, were as yet unaccustomed.

Through occasion of pain, the Cramp or convulsion is not to be neglected. First of all (I will not repeate what I have taught concerning gripings or wringings of the bowells, in the treatise concerning windes) the part that is contracted, doth not grieve by reason of the contracture (as is manifest concerning the cod, it being contracted without pain) but by reason of an offence brought on the spirit and life : For the contracture is an effect of sensation or pain, although it happens, that the pain is also increased by the coming in of the contracture.

My age, because it is fruitfull in perverse wits, will laugh at this paradox, with many others : The which notwithstanding following posterity, will willingly embrace.

The Schooles indeed have thought that a convulsion is made by the executive instruments of voluntary motion, in that respect, because they say, that there are the healthy, and disease functions of the same faculty, although they are stirred up from diverse occasional causes. A *Muscle* therefore, seeing it is the only executive member of voluntary motion, and a finew the derivative organ of the command of the will, it followes (as they teach) that a *Muscle*, although it be acted in the Cramp, against our will, yet that it is never drawn together, unless by the very same voluntary motive faculty it self, which

120 moveth that muscle while it is in health ; wherein the Schools do erroneously contradict themselves; while as they define a Convulsion to be indeed the symptome of a voluntary motion; yet to arise from a fulness, or emptiness, as it were its immediate and containing causes.

Yet it is sufficiently known, that fulness and emptiness are natural causes, but not arbitral or voluntary ones ; which natural causes, if they shorten, or contract a sinew (as they manifestly teach) at leastwise the attraction of the sinews shall not be made by an arbitrary motion.

I admire also, the hitherto famous stupidities of the Schools in this respect.

For first of all, a sinew differs from a Muscle, no otherwise than as a vein doth: This indeed, carries blood unto the Muscle, and that motion: And then, besides the two causes of a Convulsion, perhaps invented by *Hypocrates*, *Galen* hath moreover added a third, which is admitted in the Schools, to wit, a poysonous quality: For *Galen* had seen the Convulsion to follow from the stroak of Serpents ; neither yet could he as yet believe, although the stricken member was swollen, that fulness caused the Convulsion.

121 He being defective, first of all, because he was ignorant, whether a nerve ought to be smitten, that it may be pull'd together, or indeed a Muscle.

Then, because mortal Convulsions are made in gripings or wringings of the bowels, and *Hellebour* being taken, without any hurting, emptying, fulness of the sinews, or a colical poyson.

Thirdly, He is also defective, because that seeing in a Convulsion, there is made a drawing back of the member, and a shortning of the Muscle, he hath not discerned (as it otherwise beseemed the Prince of Medicine to do) why a poyson doth contract or shorten the Muscle, thus leaving the former obscurity: For truly *Galen* saith, *That the name of a Physician, is the finder out of the occasion*; which name he hath not lost in this place.

122 Again, In the fourth place, if a Convulsion happens from an empried, and filled nerve, that is, from a proper Passion of the nerve: Ought therefore a poysonous quality to be imprinted on a sinew, or on a Muscle, that a Convulsion may from thence happen?

Fifthly, *Galen* hath remained defective, and together with him, the Schools his followers, why the stroak of a Serpent, the poysonous quality of a Medicine, &c. are made the proper Passion of a voluntary motion, and of its own Organs: For if the poyson ought to be imprinted on the Muscle, therefore the sinew shall cease to be the proper subject of the Cramp, and by consequence, the emptiness, or fulness thereof is vainly supposed and required.

But if the poyson dasheth against the nerve it self, after what manner shall *Hellebour* wandring through the bowels, primarily affect the sinew? After what manner shall a Medicine, being as yet detained in the stomach, cause a Convulsion, and give a freedom therefrom, by the vomiting thereof? At leastwise it is ridiculous, that the successive alteration of the affected Muscles shall effect the shew of the Malady, if the essence of the malady dependeth on the affected sinews.

And it is a foolish thing, That an *Emprostotonos* or a Convulsive Extension of the neck forwards, a *Tetanos* or straight Extension, and an *Opisthotonos* or an Extension thereof backwards, should differ specifically, by reason of a changing of the Muscle: For a Muscle draws its tail always after the same manner, to wit, towards the head.

123 Truly such childishnesses do of necessity proceed from the ignorance of a Disease, and the rashness of a childish judgement; wherefore nature hath distinguished of the *Species* of Diseases, according to the *Species* of occasional causes, but not by reason of the difference of situations.

124 And so, seeing emptiness and fulness are terms plainly opposite, they could not produce one only kind of Convulsion: And it is a hard matter to believe, that the emptiness of a sinew being wholly privative, is as equally occasional to the Cramp, as a fulness of the same sinew: Even as it is alike blockish, that a nerve is filled for so long a time, until it shortens that nerve, and that from a small nerve being extended in its breath by repletion or filling, the Muscle is shortened: As if all the sinews could be suddenly emptied, and likewise filled, and extended unto a hugeness, in every fit of the Falling sickness, to wit, by feigned humours? as if the Convulsion were only a shortning of the Muscle, following upon the abbreviating of a dried, or moistened sinew? and indeed, as if in regard that the unaccustomed repletion of a sinew did shorten that sinew, even as the other, which by its drying of the sinews, did diminish the sinews no less in their length, than in their breadth,

breadth, the nerves did suffer an unexcusable Palsey to be from the error of a convulsive Retraction, and not rather from that of both the supposed causes? To wit, as well through a stoppage of the nerve from Phlegm filling it, as they say, as by a pressing together of the dried sinew? and as if so great a sudden drying up thereof, were credible, or possible to be in a live body? Yea, after what manner doth a nerve being now once withered, (suppose thou by too much insolency, as they say, of laxative Hellebour) presently again admit of a restauration of its own radical moisture being dried up? Why hath it been necessary to feign, and admit of a filling, or emptying of a sinew, if a poisonous quality can afford the Convulsion without either of them?

The received opinion therefore of the *Schools* concerning the causes of the Convulsion or Cramp, registred to be from the emptiness, and fulness of the sinews, is ridiculous. For although, they with *Galen*, acknowledge also a third Cause, which is that of a malignant quality: Nevertheless, they stick as convicted, in the two former Causes: For they err in the Matter, Object, Efficient, and manner of making; That is, in the whole. As if a small Nerve being extended unto a Muscle, which oft-times scarce equalizeth the grossness of a threefold thred, being moistened more than is meet, and dryer than is fit to be, should be made by so much shorter than it self, by how much a muscle drawes the members together, perhaps to to the length of a span? Yea, as though, as well the be-dashing of an hostile Humour, as the emptying of a Nerve, should cause the paines of a Convulsion!

They bring hither the ridiculous Example of *dried Clay*: when as in live Bodies drynesses are impossible; and they also afford impossible Restorations: While as notwithstanding, those Cramps do oft-times cease of their own accord. The *Schools* have thought, that those feigned Moistnesses and Drynesses of a little sinew (which could scarce effect the latitude of a straw) do contract the Muscle, even into the Convulsion of a foot-length. Neither likewise is that Example of value, *That the string of a Lute, being wet with the Rain of Heaven, leaps assunder as broken, in regard that it is cut short by the imbibed Liquor.*

For first of all, it might have been extended longer by twofold, than the feigned extension thereof in its breadth had shortened the same.

The *Schools* do not take notice, that a moist membrane is brickle, as also a dry one: and therefore also that Lute-strings are kept fat in oyl, lest they should become wet, or wax dry.

Away with their examples, which have no place in a live body! For in a living body the sinews cannot be so dried, that their witheredness can cause any abbreviation.

2. They being once dried, can never afterwards receive a moistening any more, than drie old age it self.

3. They deny a Convulsion arisen from a laxative medicine to be made by a poyson: For if they should acknowledge a poyson to be in a solutive medicine, they should cut off their own purse.

A Convulsion therefore arising from a solutive Medicine, as from only an emptying, but not from a poysonous Medicine, should be indeed from an emptiness, or dryness of the sinews: But a Convulsion or Cramp arisen from a loosening Medicine, is oft-times restored: Therefore it is not bred from a dryness of the sinews.

4. Every lean old person should be drawn back by a perpetual and universal Convulsion.

5. Seeing a sinew is not the executive member of motion, therefore the shortening of a sinew, proves not a Convulsion of the joynts, as though an arm or leg ought to follow upon the cutting short of a sinew.

6. Seeing that a nerve being moistened, (so that it were made by so much the shorter, by how much, through a forreign humour being imbibed, it should be extended on its breadth) such a humour should be plainly contrary to nature, it should effect a Palsey rather than a Convulsion: But a Palsey is Diametrically opposite to a Convulsion it self, as well in Sense as in Motion.

7. How could a stroak of the Scull presently at one moment, dry up the sinews of one side, but by moistening the other sinews opposite unto them, forthwith enlarge them on their breadth, that they may cause the Convulsion and Palsey at once? And seeing as well Emptying as Filling are feigned for the cause of the Convulsion, the stroak of the Scull ought to produce the Cramp on both sides.

8. It is no wonder therefore, that so unsuccessfull remedies have been applied to the Convulsion, if the Universities are hitherto ignorant of all the Requisites of Diseases.

129 For they ought to have known, that every Convulsion is a vital Blas of the Muscles stirred up from the in-bred *Archeus*; The occasion whereof, is a certain Malignant matter rushing on the *Archeus*, as laying in wait for the life of the Muscles.

What if *Hippocrates* hath referred the cause of a Convulsion unto emptiness, and fullness? he hath had respect unto the occasions of the foregoing life: To wit, that there was a frequent Convulsion to riotous persons, and likewise through much emptying of the Veins.

And *Galen* not apprehending the mind of the old man, hath waxed lean at the humoural filling, and emptying of the sinews, by a succeeding, and that his own device.

Such old wives fictions therefore (which have been perswaded by the Schools unto credulous youth) being despised; I say, that there is in the Muscles, a twofold motion, to wit, one as it is the Organ of a voluntary motion; and another, as being proper to it self; whereby, although it draw back it self towards its head, yet it nothing hinders, but that the spirit implanted in those motive parts, doth retract or draw back, and move those parts; even as was already said before concerning the Cod.

For neither is it repugnant to nature, for the parts to leap a little by a local motion of their own, the soul being absent: to wit, for the parts which are moveable by another Commander, to be furiously contracted through a sorrowful sensation, seeing that another conspicuous motion is singularly wanting to the Muscles, whereby it may denote the hurt brought on them, besides that whereby it executes the voluntary motion of the Soul. And moreover, it is altogether natural to all the members, and proper to the common endeavour of the parts, for those to be drawn together by reason of the sorrowfull sense of an injury brought on them; which place the *Schools* have left untouched.

130 Wherefore I have accounted it an erroneous thing, to believe with the *Schools*, That the Convulsion is an affection of the Head. For now they depart herein from their own Positions, whereby they suppose the Cramp to be from filling, or emptying, or from a poysonous quality of the Nerves, unless they had rather, the Case being now altered, that the Convulsion should arise from the filling, or emptying of the Head: But the Cramp is an accident of the sensitive Spirit; Which thing, first of all, the prickings of the Sinewes or Tendons, and likewise Fevers, Laxative poysons being taken, the stroaks or stings of Serpents, and other things like unto these, do manifest.

131 Neither in the mean time doth it argue on the contrary, that a stroak of the Head doth also bring on a Convulsion: since there is no lesse Authority to the Head, than to the Intestine, in Torments, for the framing of a Convulsion.

Indeed, as well a Convulsion arising from the head, as that which is bred from the sensitive Soul much abhorring poyson, belongs to the muscles its Clients. In a stroak of the Head, what hath presently defiled the contracted side with a poyson? Or what hath straightway emptied, or filled all the sinewes of that side? Doth not the Brain shake in sneezing? Is not the membrane which compasseth the Lungs, drawn together in a dry *Asthma*? Is not the *Pleura* or Skin girding the Ribs, wrinkled, and contracted in a *Pleurisie*; and doth it not for this cause voluntarily pull it self away from the Ribs? And is not the *Mediastinum* or membrane of the middle Belly not unfrequently contracted? Also the *Diaphragma* or Midriff-muscle through a notable anguish of pressure, straightned? whereunto a Name is hitherto wanting; although that affect be frequent in the beating of the Heart. The sometimes dull paines of the Spleen also, are the Betokeners of that Bowel its being convulsed; The stomach also is drawn together in the Hicket, vomiting, and stomach-paines. Indeed Contractures are renewed in these membranes, as oft as the molesting occasional Cause is stirred, or returneth.

Also in the beginning of a Dropsie, or Jaundice, yea even before water or wind be bred, the *Abdomen* is oft-times drawn together, and waxeth hard on one side.

Lastly, The Bowels shew forth intermitting gripes, not onely through an extension of winds (which brings forth no paines if the Belly be not stopped) but rather through a Convulsion of themselves. The which, I have elsewhere written that I have contemplated of beyond the Navil of an Infant.

132 For I beheld, that as often as wringings or gripings of the Guts were exceeding urgent, fits of the Falling-sicknesse were stirred up: but the Intestines, according to the measure of pain, were as it were by walking or moving hither and thither, diversly

diversly rouled together and contracted ; otherwise, the Intestines being appeased, and plainly at rest: For a sharp and brackish Excrement in Colicks, pricks the sensitive Soul, and this produceth pain, and as it were by intervals, drawes the Bowel together, and the wind being then shut up therein by the chance of Fortune, stretcheth out the Bowels. Therefore the Wind-Colick (so called in distinction from *Du-lech* descending) hath not its name from the Cause , but from a latter and accidental Symptome.

So likewise from Laxatives, the pain of gripes or wringings of the Bowels doth oft-times return with a Convulsion, and it is cured by things mitigating the Convulsion: For Wind-Colicks are scarce discerned from the Stone-Colick : because the same Symptome of pain, through a crisping and contracting of the Bowels, appears alike in both: For so the Oyl of *Almonds* being drunk, asswageth paines, because it pacifieth the contracted Intestines by besmearing them. Therefore seeing pain produceth a Convulsion, and this likewise, a new pain ; we see that pain doth oft-times beget pain, and that which is like it self.

And then, as oft as an injury happens to the skin, veines, arteries, or nerves, they contract themselves into wrinkles through the power of the sensitive Soul : For how notably hard doth an Artery presently become, under any pain ? The hardness whereof doth not argue the dryness of an Artery (as the *Schools* judge) : but a singular extension or convulsion thereof ; and the which therefore, Sweat being at hand, doth again produce a re-loosening of the Contraction, together with a softness: Otherwise, there is as equal a possibility of re-moistening a dried and hardened Artery, as there is hope of taking away old age. Hath not also a contracted Bladder oft-times deceived expert Cutters for the Stone ; So the Kernels that are the vessels of the Seed, are drawn together in the *Gonorrhoea* or Running of the Reines ; they being stirred up by a spur of the Seed.

The privy part also, being drawn together inwards, doth now and then so vanish out of sight, that nothing stands out beside the Nut of the Yard : So also, the muscles have their own Cramps: And so a Travelling Woman suffers by intervals, her own and cruel Contractures, as oft as the Womb co-wrinkles it self behind, that it may expel the lurking Puddle. The bone of the Groyn also, unto the share, doth by a voluntary contracture of it self, open a passage for the coming Young, with cruel pain. 134

I have seen also in Women suffering a strangling of the Womb, the Tendons in the native place of a Ligament, voluntarily to have burst asunder, and to have been contracted with cruel pain, and likewise to have returned to their former place : and the which, when they had the oftner suffered that thing, I have noted them to have complained of the more mild pain : (do happily, the *Schools*, in that leaping, and wandring digression of the finewes, acknowledge a sudden emptying, filling, or entertainment of a poysonous quality ? and the sudden banishments of these ?) It is also familiar to the stone of the Kidneys, for the Urine-pipes to be drawn together with most cruel pain, nothing peradventure being urgent beside the more tender sand. 135

I have alwayes judged it the part of bold ignorance, that winds (according to the *Schools*) should arise in the Sinews and Tendons, or be conceived in the finewes from without, as the authors of a Cramp (for, for that cause, a flatulent one) yea, and to be taken away from thence almost at pleasure : For the sensitive Spirit abhorring pain, furiously contracteth the Veines, Arteries, Tendons, and Membranes: And while as under such Furies it finds not its hoped for succour, it stirs up an increase thereof : For so a Thorn being thrust into the finger, as it causeth pain, it crispeth and hardens the Artery, and it hardens the pulse thereof which before was not there easily to be discerned, by reason of an extension onely of the contracted Artery. For it is the property of pain, to pull together and to contract, so indeed, that the bone above the share, and in the loyns, is voluntarily contracted in a Travelling Woman, although no Muscle, being the Guider or mover : For why, pain is in its own nature a contractive of the members, and that by a natural motion, and in no wise an arbitral or voluntary one : the which is especially seen in the lips of Wounds: Because they are those which are without pain, as long as they have their lips flaggy, and not contracted.

But the *Schools* have passed by the contractures of pain in Nature, as also the sensitive Soul, by running over unto winds, to the falling down of excrementitious humours, unto their sharpness, unto the agreement, and secondary passion of parts : the which notwithstanding, are altogether divers from the scope of pain ; Because they are onely abstracted Names, and for the most part, not in the least point containing the cause. 136

cause thereof, even as I have demonstrated in the Treatise concerning *Diseaffying Causes*, as it were in the combating place of exercise. For in the Urine-pipes (for an Example in the terms of the Disease of the Stone) there is no necessity, dependency of Dominion, Clients-ship, Usurpation, Possession, Custome, and no community of the Pipes, and Excrements with the bowels, or stomach. For if when the left side of the Throat is in pain, not so much as the right side thereof, in such an *angiport* or narrow passage, be now and then, afflicted: why shall we not deservedly suspect the nearness and dependency of parts which are unlike, and differing in the Ordination of their Offices, and Scituation?

It is therefore sufficient hitherto that all pain, the author of a Convulsion or Contracture, presupposeth a hatefull Guest: For there are also unpainfull Contractures (as before, concerning the *Cod*) and the which, draw their original, not so much from pain, as from meer trouble: But painfull Convulsions are made from Hostile Causes:

137 For so, Those things cause paine which smite the Spirit called (for the Soul) Sensitive, with sharpness, brackishness, or degrees of heat, or cold: But the most intrenle pain is from fire, and then from *Alcalies*, and corroding things, because they are the nearest to fire; after that, from austere or harsh, brackish and sour things, because they are the nearest to Contracture; Presently after, from salt things, then next, from sharp things, and lastly from some bitter things. But from poysons, as such, cruel pain ariseth, the which, in the Plague is ordinary, and because so great pain oft-times ariseth without sharpness; a Truth is denoted: To wit, *That pain issues from the judgement of the Sensitive Soul.*

For *Corrosives*, since they gnaw the sensitive Soul it self, they wast the parts themselves like fire. But *Alume*, *Vitriol*, *Aqua Fortes*, next the juyce of unripe Grapes, and also any sharp things, as they do by themselves crisp, and pull together the Fibers of the Organs, therefore such Excrements are Convulsory and painfull.

There are also *Alcalies*, which sleeptie paines: To wit, in Cases where they break the greatest sharpnesses of Putrefactions: For under the *Dog-star*, while as Fleshes threaten corruption at hand, the Broaths of fleshes are made sharp with an ungratefull savour; whence in the Gout, Colick, and gnawing, and putrifying Ulcers, I conceived paines to proceed at first from a sharpness. Likewise the sensitive Soul, at first feelles pain, the which being at length accustomed, waxeth the less wroth: even so as an accustomed Horse refuseth Spurs; For Nature in her self, is wholly furious and Sumpromatical, and being by degrees accustomed to paines, waxeth mild: Wherefore, Self-love, and Revenge, are before or more antient than sense or feeling: because they are intimately in Seeds, in the bosome of Nature, before Sense. For the Characters or Images of anger, agony, fear, revenge, and sorrow, do bring forth Convulsions like to those their own Idea's. For from the knowledge whereby, a Mouse abhors a Cat not before seen, the Spirit being provoked, is stirred up into anger, fear, &c. The which, by its own Idea uttereth its fury on the members, as it were by a Brand.

1. The hand waxeth cold, because the heat there cherished by the Life, is extinguished by cold: but not that the vital Spirit retires inward, as having left the arterial blood which it had married: and much less, that heat as a naked quality passeth, departeth, and returneth inward, as it were in a Comedy.

2. The heat being now diminished, cold also persisting, the cold waxeth strong, and then Sense in the hand is stupified: For the sensitive abstracted Spirits are pressed together, To wit, those which are in the sinewes, but not those which are in the Arteries; because the Spirit hath the more firmly married the arterial Blood, and it is the property of the Veines, even after death, to preserve the Blood from Con-cretion or Coagulation: For the vital Spirit is sustained from behind, by the fewel or cherishing warmth of the heart as much as may be; and therefore in that stupefaction, Life is as yet de-reined.

3. Motion languisheth in the Hand, because the Spirits being grown together in the flesh, seeing they are not sufficiently nourished from behind, by the heart, they by degrees perish, and by degrees are altered.

4. And then, together with the perishing of Motion, Sense also is extinguished; To wit, while the Blood being chased out of the Veines, threatens a clotting, Life as yet remaining.

5. And so at length the joynts are by cold totally deprived of Life; To wit, when as the venal blood hath now departed into Clots, and dyed: Therefore in the third and fourth

fourth degree aforesaid, pain springs up in the Hand being heated : For as the Heart inspires a new sensitive Spirit from behind, the which, while it takes notice of death to be readily at hand, it being as it were enraged in the same place, presently frames the Idea of its own indignation, and so puts off its native sweetness, or Complacency : Even as in the *Treatise* concerning disease Ideas, in the work concerning the Rise or Original of Medicine, I will more clearly demonstrate. So the sensitive Spirit which was not trampled on by cold, but repulsed by pressing together, in its return stirs up another Idea of its own indignation, and another pain as it were like that of the pricking of a pin.

Let the Reader in the mean time pardon me, in that I ought to borrow the Name of an *Icy* or *freezing* *Poyson*, without the necessity of fore-going *Cold* : For I call not that an *Icy* *poyson*, as if it were made cold, as I have already spoken concerning the stupefying astonishment of the Hands : but I call it a *cooling*, and also a *stupefying* *poyson*, and that which takes away sense and motion. Therefore the similitude of the Name draws its Original, not from the Root, but from the Effect:

And last of all, in this By-work, for a Conclusion of this Work, and Sensation : Let us meditate at least, of the Remedies of *Physicians* in the Apoplexy, in astonishment or benumbedness, giddiness of the Head, in the Cataleptic, *Carochus*, *Coma*, Convulsions, plucking of the Eyelids, Eyes, Tongue, and Lips : For thou shalt find, that presently cutting of a vein, and a Clyster are prescribed : They doubting in the mean time, Whether the dung of the Fundament may pluck the Tongue and Lips in the mouth, may likewise stamp drowinesses, and astonishment in the sick ; As it hath brought forth blockishnesses and neglect in the *Physician* : Or indeed, whether these arise from the venal blood : therefore they are presently intent upon both at once. And then on the day following, they administer purging things : And thirdly, as being full of uncertainty, after Rubbings, they provoke Sweats. For their Succours are universal, because others are wanting, and they are ignorant of such : And therefore their total, usual Medicines are general ones : Through defect of the knowledge of efficient Causes, they wander onely about the Products : they not being solicitous of the Radical Framer and Cause, are onely busied about removing of the Effect : Not that they hope for a return of the Disease, by leaving the Roots, that they may thereby crop Fruit ; (for I will not suspect that of a good or honest man) but they being too earnestly bent upon Gain, nothing hath hitherto been considered by the *Schools* concerning the Framer of Diseases : For as much as Medicine (as I have said it from the Beginning : so I again end therewith) is the Gift of God. But this God hath withdrawn his Gifts from those that are intent upon Gain, nor those once thinking of his Command ; *Be ye mercifull as your Father which is in the Heavens, is mercifull, from whom every good and lightsome Gift descendeth.* This therefore is the mournfull modern Tragedy of *unsensibleness* and *pain*, which I have spoken of, with an event altogether Tragical to the Sick.

AN
UNHEARD-OF DOCTRINE
OF
FEVERS.

JOHN BAPTISTA VAN HELMONT Toparch in Royenborgh,
Pellines, &c. being the Author.

Whereunto is added,
A TREATISE
AGAINST
The four Humours
OF THE
SCHOOLES.

AN
ENHANCED OF DOCTRINE
OF
FEVERS.

which, &c. being the Author.

A TREATISE
OF THE
The four Humours
OF THE
SCHOOLS

To the Reader, John Baptista van Helmont, Toparch in
 Royenborgh, Pellines, &c. P. L. wisheth Science,
 Health, and Joy.

An Index of the Contents of the Preface.

1. This Treatise is rent out of the great Volume, which is inscribed, The new and unheard of Beginnings of natural Philosophy. 2. The Authour's Testimonies of Dispraise against Physicians that refuse to learn.

Have seen perhaps two hundred Authours concerning Fevers : therefore it hath shamed me of the Title : but when I more thorowly considered of the matter it self, I saw, that one and all of others, sung the Cuckow's Note, and that they have alwayes subscribed the same thing to themselves from others words. For from thence I discerned, that since the dayes of Hippocrates, Medicine hath stood at a stand, if it hath not gone back ; at leastwise that it hath not profited, because by new Centuries daily, it hath gone into a Circle. They have gone, not whither they ought to go, but whither they have followed blind Leaders which the most High hath not Created, or chosen for Physicians ; but who have entered into Nature through the toren windowes of Heathenisme and Atheisme. Surely, it hath shamed me, yea and grieved me, that a Fever, the most known or remarkeable of Diseases, is as yet to this day altogether unknown in the whole course of its Tragedy. Wherefore I seem to be the First who may determine of any thing of certainty concerning the knowledge and Remedy of a Fever. For I have written a great Volume, concerning the knowings and curings of Diseases : Surely great and unheard of, from the very first Beginnings of true Philosophy : indeed, I have demonstrated unwonted Principles to be true, and that by any kind of Demonstrations.

Out of this work I have rent this Treatise concerning Fevers ; and since I daily saw abuses to increase in curing, and I divined of no small destruction of mortals from thence : Therefore I have set forth this Treatise without the Doctrines of Diseases akinne thereunto, because I know that Paradoxall principles will offend very many, who have studied more in assenting than in diligently searching : although this kind of study attesteth a certain sloath and penurie of judgement. In the mean time, I hope, that there will not be Lovers of the Truth wanting, who earnestly breathing after the health of their Neighbour, will hear even from now the most antient Physician of the Dutch, those things which they never heard from any other. For it ought not to be burdensome to any, to be able to learn by others labours : although it be a tedious thing to those that are old, to swallow this Testimony of Dispraise : "None hath hitherto known Fevers from their essence : none hath begun the curing of them from Art, because all, in passing by the true knowledge of the Causes, and manner of their making, have neglected to seek out their Remedies. They have shot forth their Arrows against Heats, and have passed by

“the true mark of the thing. But since there is so great a malepartnesse, and a certain singular insolency of the judgements of this Age, indeed I have feared, that this Ulcerous Age will not admit of my work. This small Treatise will shew as it were a cast Lot, what the Lord hath determined concerning my Labours. In the mean time, they who have already grown old in their diminishments of the Veines and strength, peradventure it will be hard for them to have departed from things accustomed. I intreat them at least, that they would see in what manner they shall preserve their own Souls, and the cause of widowes, and Orphans, which is committed unto all.

Farewell.

A

A
Treatise
OF
FEVERS.

CHAP. I.

The definition of the *Fever* of the Antients,
is examined.

1. A *Fever* hath been hitherto, radically unknown. 2. The definition of a *Fever* according to the Schooles. 3. The chief clause cast forth even from the requisites of the Antients. 4. A second defect of the definition. 5. A vain private shift of the Schooles. 6. Some perplexities following from thence. 7. Other hiding places. 8. Others contradict things known by sense. 9. A wan argument of these men. 10. The thirst of feverish persons is examined. 11. An argument from the remedy of thirst. 12. An argument from a like thing, taken from the drowsie evil. 13. Another argument from thirst in the vigour of Fevers. 14. It is the part of deadly ignorance, badly to define a *Fever*. 15. An argument against the Schooles concerning feverish heat. 16. A second. 17. A third. 18. A fourth. 19. A fifth. 20. Feverish heat is not from the matter offending. 21. Another argument. 22. A third. 23. A fourth. 24. A fifth. 25. That a feverish heat is not of the peccant matter. 26. The matter of a *Fever* beates occasionally only. 27. Who is the workman of feverish heat. 28. The original of heat besides nature. 29. To make hot, and to be hot; how they differ. 30. Heat is a latter accident unto the essence of a *Fever*. 31. From whence a feverish heat is. 32. A *Fever* is not heat, essentially.

Fever, goes before, accompanes, or follows most diseases; Therefore I have owed a peculiar treatise unto a *Fever*, no lesse than to the disease of the Stone. Because although it be that which is most familiar, yet it most especially fats our burying places, and depopulates camps.

The disease is known indeed, even from its entrance or beginning: but not any thing hath been hitherto known by Physicians, in its causes, manner of making, seates, as neither in its remedies, even as in reading this li-

the book shall be clearly made manifest unto any one that is seasoned with the studies of Philosophy.

2 For indeed, the Schooles define a *Fever*; that it is a heat besides nature, being kindled first in the heart, and then derived throughout the whole body: I will add according to their mind, hurting most actions.

3 The top of the matter is, that they call the *Genus* or general kind of the thing defined, or the essence of a *Fever*; not any kind of heat whatsoever: but that which shall be besides nature, and which shall hurt in its own degree.

4 And so, seeing that heat is essential to a *Fever*, that it ought chiefly to be so inseparable from a *Fever*, that a *Fever* cannot be mentally conceived, but that, that heat is an individual companion thereunto. First of all, *Camp Fevers* have newly objected themselves, the which happen without thirst, and a manifest heat: That is, they finish their tragedy without heat, from the beginning even unto the end of life.

5 If they say, that these *Fevers* were unknown to the Antients, nor therefore to be comprehended under the definition; I at least conclude from thence, that neither can these *Fevers* therefore be *Fevers*, or that the essence of *Fevers* are not of necessity tied up to heat, but only by accident.

6 And then again, that the definition of *Fevers* from of old delivered, and even till this day observed in the Schooles, is not suitable to the nature of a *Fever*. And thirdly, that whosoever shall at the beginnings of *Fevers*, feel cold pithily to pierce him for some houres, may notwithstanding, not perswade himself that a *Fever* is begun or present with him, but some other affect hitherto unnamed. For although he be shaken with vehement cold, his teeth do shake, and his lips look wan by reason of cold, yet that he may perswade himself by those deformities, that those beginnings of *Fevers* are not the beginnings of *Fevers*: for neither is he extinct by a true *Fever*, who dies in such beginnings, the which for the most part, comes to passe in intermitting *Fevers*. Let him believe it that will; for I am not wont to call to me any other judge concerning contingent things known by sense, besides touching: For I am so stupid, that I stand to nought but the judgment of the senses, concerning sensible objects.

7 But Physicians which are the more tough in the opinion of the Antients, privily escape into lurking places, that they may defend those things which are perceived by *Galen*: for some will have it, that cold or rigour are not the beginnings of *Fevers*, but the beginnings of the fit. But *Galen* himself casts down these men; saying, *We understand first by the name of a Paroxysmus or fit, the worst part of the whole fit; which soundeth, that the fit and the Fever are Synonymalls.* But come on then, if cold bespeak the beginning of the fit, and not of the *Fever*, at leastwise, the fit shewes the *Fever* approaching: and so, the beginning of a fit shall of necessity be the beginning of a *Fever*.

8 Others therefore had rather, their eyes being opened, not to see, not to perceive; wherefore they say, that in very deed, no true, but a dissembling cold, and a deceitfull allurements of the senses is felt in the beginning of a *Fever*; and while they are externally cold, they will have it, that they are internally in a raging heat, and are burnt with true heat, although they perceive otherwise. But such doatages any one will easily hiss out of the middle of the Country: For a most intense or heightened cold besigeth their innermost parts for some houres.

9 For in so manifest, and undoubted an History of cold (which is that of the deed, and sense) they produce an argument wan enough: there is (they say) a great heat within, although not to be perceived; because they are pressed with continual thirst, the which, as it is chiefly the betokener of drynesse, yet this thirst in live bodies presupposeth an heat equal to itself: And so, thirst deserveth more Authority than sense or feeling.

10 But they know not that this thirst proceeds not from heat, as neither from drynesse, even as it otherwise happens in natural thirst: For therefore that neither is it appeased by drink being administred; The which ought regularly to be done, if that thirst did arise from drynesse or heat. The thirst therefore is deceitfull, but not the cold: For the thirst ariseth from an excrement which badly affecteth that sensitive faculty, and the organ thereof, and deludes it, no otherwise than as if great drynesse had suddenly come unto it.

11 For the sharp distillation of Sulphur (which in it self, is most dry and a corrosive) is wont to mitigate that deceitfull thirst, no otherwise than as water quenchem fire: But at leastwise our adversaries will not grant, that dryth is taken away by the most dry remedies; but not rather, by the drinking of moist and cold things: But why is it not lawfull, by

by a like reason to divine; that cold in the beginning of *Fevers* is from an unconquered drowfie affect? Since the Schooles determine that the drowfie evil doth no lesse proceed from unvanquished cold, than thirst from drynesse.

Neither doth that hinder, that the drowfie evil is not present with all that have a *Fever*: 12 For it is sufficient, and brings the greater confusion, that in some that have *Fevers*, there is a frequent drowfinesse.

But at length, whither will they escape, if in the vigour of *Fevers* (which is 13 the hottest station of *Fevers*) they grant not so great thirst to be, as in the beginning thereof; yet that the more inward parts do then according to sense, especially burn with much perplexity: wherefore if thirst bewray heat, and the betokening hereof be unseperable from heat, so as that those who tremble by reason of cold are nevertheless said to burn, the greatest thirst ought to presse under the hottest season of *Fevers*: But they deny that; what therefore will they do, being taken in their own net? Therefore they largely erre, as many as give their judgments concerning the native roots of things from accidents following by accident.

It is therefore the part of deadly ignorance, badly to have defined a *Fever*, if they shall 14 cure a *Fever* according to its definition. Yea we must treat against them by the Law of *Cornelius*, concerning privie Murderers, who obstinately, badly cure those who have committed their life unto them: because that through the guilt of whom, so many ten thousands of millions are so unhappily killed.

And indeed, if a *Fever*, or *Feverish* heat (for these two are in the Schooles, Sunony- 15 mals or of one and the same name) ought to be kindled first in the heart, nor yet that the matter of *Fevers* (which they say doth proceed from one of the four humours being putrified) consisteth in the bowmes of the heart: therefore the heat, or *Fever*, is not kindled at first, in a *Feverish* matter; and putrefaction is vainely enquired into, that they may finde out the intimate, and immediate cause of heat besides nature: And by consequence, the definition of a *Fever* from thence, falls to the ground.

Yea it followes from thence, that a *Fever* doth not primarily, intimately, and immedi- 16 atly exist in its own matter from whence it is caused (as they will have it) materially, and originally: but in some other place, namely, in the heart alone.

Again, from the same position, it followes, that, that there may be a *Fever*, it is not- required that the offending and feverish matter be enflamed: but some other inflame- able thing primarily residing in the heart, and from thence slideable throughout the whole body: For this inflameable body, I (together with *Hippocrates*) call the spirit which maketh the assault.

But this last matter, I have brought hither, not from the minde of the Antients; but it 17 is extorted, and by force I have commanded it to be granted me: Whereof in its own place, when I shall discourse of the efficient cause of *Fevers*: At least wise that being now violently begged, it followes, that the peccant matter of *Fevers* is not properly enflamed, neither that it is in it self, primarily, or efficiently hot, nor indeed, that it makes hot besides nature, if the first inflameable body ought to be kindled in the heart. Therefore neither is the peccant or offensive matter in a *Fever* hot beyond, or besides the degree of nature. But that which is kindled in the heart, was not kindled before the comming of the *Fever*: and so it every way differs from the peccant matter in *Fevers*.

At length it is also from hence fitly concluded, that in whomsoever they intend 18 to slay a *Fever* by cooling things, as such, they do not intend to cure by a removal of the causes, by a cutting up of the Root, and a plucking out of the fountaine, and fewel of the *Fever*: but only they intend to take away, and correct the heat, which is a certaine latter product entertained with-out the feverish matter: To wit, they apply their remedies unto the effect, but not unto the cause.

For truly the heat of *Fevers* is kindled in the Archeus which maketh the assault, and the 19 root of *Fevers* is the peccant matter it self. They have regard therefore, only unto the taking away of the effect following upon, and resulting from the placing of that root, for the sake whereof, the Archeus is enflamed not indeed by the root, but by heat drawn from elsewhere, while as indeed he enflames himself by a proper animosity, and by his own heat being beyond a requirance extended unto a degree, wherein he is wholly troublesome, as he is enlarged beyond the amplenesse of his own necessity.

For neither must we think that any heat is so in a hateful feverish matter, which with me 20 they name the offensive one, that it afterwards makes feverishly hot the whole entire body.

- body: "For truly, that for which every thing is such, that very thing, they will have to be
 21 "more such. And then also, because every calefactive or heating agent doth throughout its own species, more strongly act on a near object, than on an object at a distance; wherefore if a feverish matter should make the other parts hot by its own heat, it should of necessity be, that the center or nest wherein that peccant matter of a Fever is recieved, should be first roasted into a fried substance, before that any distant object should be made hot thereby.
- 22 Yea, if the peccant matter should be hot of its own free accord, and the Fever should be that meer heat besides nature, every Fever as such, ought to be continual, nor should it have intermission, until that all the offensive matter were wholly consumed into ashes. Neither therefore should there be any reason of a repetition, or relapse, seeing
 23 the peccant matter should even from a general property, always make hot, for the consuming of it self. And moreover a dead carcase also should be hot as well after death,
 24 and be more ardently tortured or writhed with a Fever, than while it lived, because the same matter in number from the obedience whereof death happens, even still persisteth in the dead carcase: and seeing they suppose it to be hot by a proper heat of putrefaction, and since it is more putrified after death, as also after death more powerfully putrifying, and affecteth more parts co-bordering upon it, than while it lived; therefore also it should be more actually hot after death, than in the life time: But surely this error is bewrayed: For a Fever which made a live body hot, ceaseth presently after death, and all heat expires with the life.
- 25 The which ought to instruct us, that the heat of a Fever is not proper unto the peccant matter, or its inmate: and that the heat of the offensive matter doth not efficiently, and effectually make hot in Fevers: Therefore it is perpetually true that the peccant matter makes hot occasionally only; but that the Archeus is the workman of every alteration, and so by this title, that which efficiently, primarily, immediatly, always, every
 26 where, maketh the assault, and that he alone doth not make hot according to the maxime:
 27 "Whatsoever utters healthy actions in healthy bodies, that very thing utters vitiated ones "in diseases: For that spirit heats man naturally in health, it being the same which in Fevers rageth with heat.
- 28 For example: The thorne or splinter of an oake being thrust into the finger, and actually, and potentially cold, presently stirs up a heat besides nature in the finger. Not indeed, that hot humours do flow thither, as if they being called together thither by the thorne, had expected the wound of the splinter, and the which otherwise as moderate, had resided in their own seates: For truly the blood next to the wound, first runs to it, and preventeth the passage for other blood coming thither: And that blood also, by itself is not hot; but for the sake of the vital spirit: Therefore the inflammation, and swelling, together with an hard pulse, pain, and heat, do proceed from the spirit alone causally; but from the infixed thorn, occasionally only. Surely it is an example sufficient for the position, manner, knowledg, and cure of a Fever: To wit the cause offending in a Fever is not hot of it self, but it makes hot only occasionally, and upon the pulling out of the
 29 thorne or occasional cause, health followes: The Archeus alone every where effectually stirs up the Fever, and the which departing by death, the Fever ceaseth with it: Therefore heat is a latter accident, and subsequent upon the essence of a Fever. For indeed
 30 the Archeus enflames himself in his endeavour, whereby he could earnestly desire to expel the occasional matter, as it were a thorne thrust into himself. But whosoever takes
 31 away this thorne, whether that be done by hot meanes, or by temperate ones, or at length, by cold ones, he takes away the disease by the Root, and it is unto nature as it were indifferent: Because for that very cause the animosity of the Archeus is appeased, and ceaseth: Wherefore heat, however it being besides nature increased, may be a token of
 32 Fevers; yet it is not the Fever it self, neither therefore must we greatly labour about it in time of healing: For from hence Hippocrates hath seriously admonished, that heat and cold are not diseases, as neither the causes of these: but that the causes (to wit, the occasional ones) of diseases, are bitter, sharp, salt, brackish, &c. But that the spirit is he that maketh all assaults. Galen, Juniour unto Hippocrates by five hundred years, afterwards easily stained much paper, and by his prate allured followers unto himself: But posterity having admired this prattle, followed the same: it hath always had that in the greatest esteem which was of the least worth: And then the world every where grew aged in frivolous judgments, always esteeming that to be of great weight, which was most like unto its own unconstancy.

CHAP. II.

The Schools Nodding or Doubling, have introduced Putrefaction.

1. The Schools have been constrained to devise another thing in Fevers beside heat.
2. Another defect in the definition of a Fever.
3. The Schools contradict the principles laid down by themselves.
4. That the essence of Fevers is not from heat.
5. They by degrees are forgetful of their own positions.
6. The spiciness of Roses is most hot.
7. Whether a Feverish heat be rightly judged by the Schools, to arise from Putrefaction.
8. A malignant Fever, wherein it differs from other Fevers.
9. A Crisis of Fevers by sweat, is most wholesome.
10. Why the Schools have fled back unto Putrefaction.
11. A blockish comparison of heat in horse-dung.
12. Why horse-dung is hot.
13. A degree of the heat of a putrifying matter is not sufficient for heating the whole man in a Fever.
14. Putrefaction is no where the cause of heat.
15. Dung waxeth not hot from Putrefaction.
16. Why they have not drawn a feverish heat from hot Baths.
17. The ignorance of the Roots hath wrested the Schools aside unto the considerations, and remedies of effects.
18. Dung looseth its heat, while it begins to putrefie.
19. The great blindness of the Schools.
20. Galen convicted of error.
21. That the blood doth never putrefie in the veins, and so whatsoever they trifle concerning a Sunochus or putrefied Fever, is erroneous.
22. The foregoing particulars are proved.
23. The natural endowments of the veins.
24. Either Nature goes to ruine, or the Doctrine of the Schools.
25. An example from the variety of blood.
26. A ridiculous table of blood let out of the veins.
27. An argument from the Plague, against the Use of the Schools.
28. Again, from the Pleurisie.
29. The heats, and turbulencies of the blood do not testifie the vices thereof.
30. A wan deceit of the Schools.
31. To suppose putrefied humours in Fevers, is ridiculous.
32. Against the definition of Fevers of the foregoing Chapter, some absurdities are alledged.
33. A frivolous excuse, by a Diary.
34. The foregoing definition of Fevers is again resisted.
35. The unconstancy of the Schools.
36. That the blood doth not putrefie in the veins.
37. Corruption, from whence it is.
38. That the blood of the Hemeroides is not putrefied.
39. A wonderful remedy against the Hemeroides or Piles, by a ring: And likewise for other Diseases.

THE Schools meditated, that an heat did oft-times spring up through exercises, not unlike to the heat of feverish persons; the which notwithstanding, seeing it was not a feverish one, they indeed judged heat to be, of necessity, in Fevers; not any one in differently, but that which should be stirred up by putrefaction.

Now they are no longer careful concerning heat, as neither concerning the degrees, or distemperature thereof; but rather concerning the containing cause thereof; For neither hath a heat graduated besides nature, seemed to be sufficient for a Fever, unless that heat also spring up from putrefaction; which particle surely, hath been dully omitted in the aforesaid definition of Fevers.

Therefore the essence of a Fever, is now no longer a naked heat, neither shall this heat distinguish Fevers from the diversity of heat, (although a Species doth result from thence, whence the essence is) but from the varieties of the putrefied, or at leastwise from the putrefying humours.

It was finely indeed begun, thus to wander from the terms proposed, that when as they before respected nothing but heat which should exceed the accustomed temper of nature, they afterwards require heat, and a subject of putrefaction, which heat they will have

have to be kindled in an offensive putrified matter; but not any longer, first in the heart.

4 But seeing that of heat, there is not but only Species in degree, but very many moments, or extensions of the same; and there are very many particular kinds of Fevers; neither that the specificall multitude of Fevers can proceed from one only Species of heat besides nature: Therefore in the Essence or Being of heat, another thing is beheld besides the degree of the same.

Heat therefore shall not constitute the Essence of a Fever, but that other thing, by reason whereof the diversity of Fevers breaks forth. If therefore putrefying of divers matters be the efficient cause of the diversity of Fevers, heat shall be thing as well caused from putrefaction, as the Fever it self; and so seeing the action of causality of the putrified matter involveth some other thing in it besides heat it self, a Fever shall not be heat.

Now the Schools do confusedly adjoyn very many things on both sides, that if one thing
5 do not help, at leastwise, another may help them: So that although they toughly maintain the aforesaid definition, and adore it; yet they by degrees decline from the naked distemper of heat, unto the putrefaction of Humours. Neither do they stay in these trifles, but moreover, they flee back unto hot remedies, as having forgotten their own Positions: And that, whether they attempt Purgations, or next, whether they shall convert themselves unto the proper specificall Remedies of Fevers.

9 For what is now more solemn in healing, than to have given *Apozemes* of *Hop*, *Asparagus*, &c. and to have seasoned the same with Sugar? For what is more hot, than the spiciness included in *Roses*, whether thou respectest its savour, or application; without which notwithstanding, the *Rose* it self is a meer dead carcase? what doth every where more frequently offer it self, than to have mingled the corrosive liquor of *Sulphur*, or *Vitriol* (being through the perswasion of gain, manifoldly adulterated) with *Juleps*, for Fevers?

In the next place, to have drawn forth those which they feign to be guilty humours, by *Rhubarb*, and *Scammoneated* Medicines? Therefore before all, we must profesly examine, whether the heat of a Fever owes its Original to Putrefaction: Wherefore first
7 of all I have plainly taught, That a feverish heat doth in no wise causally depend on the peccant matter. And then I have learned, that a malignant Fever alone, differs from
8 other Fevers in this, that its own offensive matter hath a beginning-putrefaction adjoined unto it: The which, if it shall afterwards creep unto its height, until the putrefaction be actually made, and shall remain within, it straightway brings death of necessity: But if it be driven forth in the making of the Putrefaction, (as in the *Measles*, an *Erisipelas*, &c.) it is for the most part cured: Because health for the most part accompanies a motion to without.

From hence it is, that Fevers do about their end, provoke voluntary sweats. And a
9 Crisis or judicial sign which is terminated by sweats, is most exceeding wholesome, and by consequence also, sudoriferous Remedies: But they fled together unto Putrefaction, that they might find the cause from whence they might confirm, first, cold, and presently afterwards, heat.

10 They therefore assume, that Horse-dung which is actually cold, doth voluntarily wax hot by reason of putrefaction: But how blockishly do they on both sides deceive the credulous world! For Cowes-dung of the same nourishments, hath better putrified, and
11 been digested than Horse-dung, yet it waxeth not hot: Also the dung of an Horse which is fed with grass, or Fetches, waxeth not hot, even as while he is fed with grain; yet that hath putrified no less than this.

They have not known therefore, that heat follows the eaten grain, but not the nature of Putrefaction: Therefore they foolishly transfer a feverish heat unto humours
12 putrified in a Fever, from the heat of the dung not yet putrefying.

The Schools thefore have not known, that by how much the nearer Horse-dung is unto a beginning-putrefaction, by so much the more it is deprived of all heat: And neither therefore shall the same dung ever putrifie, if it be spread broad; But only while as being moist, it is contracted into an heap, no otherwise than as Hay, or Flowers, if they are pressed together being moist, are inflamed before putrefaction: They have been ignorant I say, that dung waxeth hot by its own spirits of salt being pressed together.

Again, although dung do wax hot in the making of Putrefaction, yet all heat ceaseth before the Putrefaction begun is in its [being made:] And so the heat of the dung squares not with a feverish matter, if the putrified matter (as they say) layes hid long before in Receptacles, and indeed, in a *Quartane*, always, and very long.

Yea, neither is the degree of the heat of dung suitable, that it may be dispersed from its putrefied center, even unto the soles of the feet; but that it should first burn up the center of the body, where that putrefied humour should overflow: Therefore the example of dung is plainly impertinent to *Fevers*, and so much the rather, because they do not teach, that Cold is before Heat in time.

And moreover in nature, Putrefaction no where causeth heat, and much less in vital things: For in a putrefying body, Cold must needs be, if it be spoiled of life; which life in us, is the fountain of heat: For in the interposing dayes of intermitting *Fevers*, we complain not of heat, or Cold molests us; when as notwithstanding, they suppose the humours to be putrefied: Therefore if Heat, and Cold do causally succeed in that which is putrefied, and Cold be always before Heat, in the coming of *Fevers*, Cold is more native to a putrefied matter than Heat: For therefore we measure the long continuance of the Disease, by the duration of cold in an Ague or Fever, but not by heat.

At length, I have shewn that all feverish heat is wholly from the *Archens*, and therefore that it ceaseth before death; when as notwithstanding, Cold, and Putrefaction do the more prevail. It implies also, that the heat of a Fever should be from a putrefied matter, and that it should be first kindled in the heart it self, from whence the Putrefaction is banished.

In the next place, Heat is not kindled in dung from the Putrefaction it self; For if it be daily be-sprinkled with the new urine of a horse, it will not so much as wax hot in a years time: But it is certain, that urine doth not preserve from putrefaction, but more truly, that it should increase it: For they should more truly have drawn heats out of Baths, or Lime: But they were rather ignorant of the Causes of these Heats: Wherefore they have judged it a more easie matter to have accused the putrefaction of one horse-dung: Neither was there any reason why they should borrow the essence of a Fever, rather from heat than from cold, and other symptoms; Seeing they are the alike, and fellow accidents of *Fevers*: Therefore they have always endeavoured to beat down the accidents of the Product; because they have been ignorant of the roots: But since it is now manifest, that material things are the matter it self, after what manner will they cure, who convert the whole hinge of healing only unto heats? At leastwise, the similitude of horse-dung, and of a feverish heat ascribed unto putrefaction, hath fallen: For dung when it begins never so little to putrifie, it puts off heat: And as long as it can be hot, Artificers extract Salt-peter from thence: But if it shall wax cold, they leave it to Countrey Folks, as unprofitable for themselves.

But the Schools accuse the Putrefaction or Corruption of Humours; and indeed of one and the same Humour, as well for Cold, as for Heat, and both in a heightened degree; And by consequence, that one and the same thing should immediately effect two Opposites out of it self: Therefore it must needs be, that either of these two, is by it self, but the other by accident.

If therefore Cold be the Off-spring of Putrefaction by it self, it cannot in any wise essentially include heat, but only by accident.

But if Heat be the son of Putrefaction by it self, verily, neither then should a Fever begin from Cold.

Nevertheless, it is clear enough from the aforesaid particulars, that the Schools do suppose Putrefaction to be the essence of *Fevers*; But Heat, and Cold to be accidents accompanying the Putrefaction: Wherefore *Galen* saith, *When blood putrifies, Choler is made*: which Text if they shall admit of, that Choler shall be putrified in its own birth, or not: If putrified, it should cause a Tertian; but not a *Synochus* or putrified burning Fever.

Let the Schools therefore know, that the blood is never putrified in the veins, but that the vein it self also putrifies, as in a Gangrene, and in Mortifications: And so they beg the principle, who let forth the blood, lest it should putrifie in the veins. Likewise they who affirm a *Synochus* to arise from the blood of the veins being putrified: And also they who say, that the blood while it putrifies, is turned into Choler: The which particulars I thus prove.

The veins retain their blood fluid, even in a dead carcase, by the consent of all Anatomy; but the blood being chased out of the veins, straightway grows together into a clot: But the coagulation of the blood, is only a beginning of Corruption, and way of separation of the whole: Therefore if a vein preserves its blood from corruption in a dead carcase, much more doth it do that in live bodies; It being an argument from the less to the greater.

Forreign excrements indeed putrifie in the veins; to wit, they being the Retents as

well of their own, as of another digestion, (as concerning digestions elsewhere) but the blood never; Because it is that which according to the Scriptures, is the seat and treasure of life.

If therefore the life it self cannot preserve its own seat, and treasure from corruption, as long as it is in the veins, when shall it preserve it? and how shall it ever be free from corruption? And likewise, if the life doth not preserve the blood from corruption wherein it glistens, after what manner shall the bones be preserved? The veins therefore are ordained by the Creator, that they may preserve the blood from corruption, because the life is co-fermented with the blood of the veins: Therefore under this Question; the ornament, and appointment of nature goes to ruine; or the whole order of healing hitherto adored by Physicians, falls to the ground: But be it so, by what sign do Physicians judge of putrified blood? Is it not from the more white, black, yellow, somewhat green, or dusky colour? Is it not from a slimy, gross, watery, thin matter? And lastly, Is it not from a consistence not threddy or fibrous, scarce cleaving together, &c.

But I declare under the penalty of a convicted lye, if any one will make tryal, that I have examined the bloods of two hundred wanton countrey and healthy people in one only day, and many of them were exceeding unlike in their aspect, colour, matter, and consistence; many whereof I distilled, and found them to be alike profitable in healing: For our Countrey Boores are wont at every Whitsontide to let out their blood, whereby they might drink the more largely: For although many of them seemed to be putrefied, others cankerly, or black chole-ry; yet especially, the Countrymen from whence they had issued, were very healthy: Therefore they confirmed by the cause, the tokens of corruption not withstanding them, that their bloods were not any thing estranged from the nature of a Balsame: Wherefore I have laughed at the Table of judgements, from the beholding of blood let out of the veins; and so I confirmed it with my self, that the venal blood is commanded by Physicians to be kept, that at least in his regard, they may reckon one visit to the sick: For if the corruption of the blood hath any where place, and betokeneth the letting forth of it self from that Title; surely that must be in the Plague: But in the Plague, the cutting of a vein is destructive; Therefore there is no where putrefaction in the blood of the veins; and a fear, lest the putrefaction of that blood should prevail, and by consequence, the scope of letting out the blood, is in this respect, erroneous.

I suppose also thirty men to be oppressed with an equal Pleurisie; but ten of them to pour forth blood out of a vein apparently vitiated, (for the blood of those that have the Pleurisie, is like red wine, whereunto clots of Milk have a Conflux) but the remaining twenty, I will cure without shedding of their blood. It is certain in the mean time, that those twenty have their blood no otherwise affected, than the ten whose vein was cut.

And again, That if in those twenty that were cured, a vein be opened, their blood shall be found rectified, restored into its former state, and far estranged from a pleuritical error: Therefore the blood of him that hath a Pleurisie, is not corrupted, although it may seem to be such: The which I prove, Because from that which is corrupted, or deprived of life, there is not granted a return unto life, health, or an habit: Therefore black, blew, or wan, green, &c. blood, do not testifie of its corruption, but they afford signes of its fermental angry heat, or turbulency alone.

For first of all, if the more waterish, and yellow blood should betoken a vice, the arterial blood should be far worse than the blood of the veins; which thing is erroneous: For the blood of the veins is no otherwise distinguished by the aforesaid signs, than as wine is troubled while the Vine flourish; for it is not therefore corrupted, because the tempest being withdrawn, it voluntarily cleers up again: So likewise a Fever doth variously disturb the blood, and discolour it with strange faces: But these masks cease, the Fever being taken away.

Truly I am wont to compare the Lookers into the blood, unto those who give their judgement concerning Spanish Wine, and who give their thoughts in beholding of the urine.

But they will say, If putrefaction be not in the blood, why then doth purely red blood leap out of a vein at the third, and not at the first turn; or at the first, and not at the third turn? But that argument at least convinceth, that one part of the blood is more, and sooner disturbed than another; not the whole, or all at once: For it is certain, that nature tends by degrees in a lineal path, unto the perfection appointed for her: Therefore that the blood

blood nigh the heart is more pure than that which is about the first shop thereof: Therefore they say, (and err therein) *That a Tertian, as well as that which is Continual, as that which is renewed by Intervals, consisteth of yellow Choler, a Quartan of black Choler, as also a Quotidian of phlegm, but putrified ones.*

For why was it of necessity to suppose these Humours (the which I have elsewhere demonstrated to be feigned ones) to be putrified, seeing they confess a non-putrified Sunochus to be continual, and more cruel than the three aforesaid Fevers: Which particulars surely, if they are compared with the definition of Fevers proposed, now of necessity the blood in every Sunochus or continual Fever, and the vital spirit in a diary Fever shall putrifie, the life remaining; to wit, they shall attain the bound of putrefaction:

And then, seeing the Schools confess that such putrified humours do not consist in the sheath of the heart, and that therefore they are not primarily inflamed in a Fever, and so by consequence, that putrefaction is in vain required for a feverish heart to be kindled in the heart.

If therefore putrified Humours do enflame the spirit in the heart from far, that thing shall by every law of nature be made nigh, before afar off, and they shall the rather, or more fully enflame all the blood that lyes between the heart, and themselves, with the heat of Putrefaction, and so all Fevers shall of necessity afford a putrified continual Fever: Wherefore neither shall a Quartan Ague stop its course, and repeat its return, if the same putrified matter thereof waiteth safe in the Spleen for a years space.

Gangrens certainly teach me, that nothing of a putrified matter (for every putrified matter is dead) can long persist without a further Contagion of it self: Neither do I apprehend how the *Archens* of life: it self shall putrifie, that it may give satisfaction to *Galen* for a diary Fever? But if they understand a diary Fever to be the daughter of that Putrefaction, which at length is implanted in the spirit of life; But thus all Fevers in the Schools, should be Diaries.

Again, If a diary or one dayes Fever be the daughter of Putrefaction; therefore Putrefaction is presupposed to be fermented to the spirit of life: From whence there is a relapse unto the same Straights.

But if they understand Putrefaction beginning onely, or a Disposition unto Putrefaction, and that the Heat is an Effect of Putrefaction, therefore it followes, that a diary Fever shall have onely a Disposition unto Heat; but not a true heat, even as, that neither therefore shall it be a true Fever.

But the Schools require a formal, and absolute putrefaction, that they may find out the cause of a feverish Heat; Having forgotten, that then heat shall be an effect of the Putrefaction, and not of the Fever; and so they shall constrainedly distinguish Heat from a Fever: For why; seeing a non-putrified continual Fever, is a true Fever, without putrefaction, and by consequence ought to be without Heat.

In the mean time, they by little and little lay aside the fear of heat; neither must we in healing employ our selves thereabout, while as a greater damage is to be feared from the contagion of putrefaction in those things which have a co-resemblance: And therefore it would be better to divert the putrefaction, than vainly to have smeared over a Fever with cooling things.

But surely, whatsoever things resist putrefaction, are hot: For Myrrhe preserveth the dead Carcases of *Egypt* for now two thousand years; The which otherwise, with Succory, Plantain, and their Coolers had putrified long since: Therefore the putrefactions of putrified Humours, likewise of the blood, and spirit, are so like unto Fables, that I should scarce believe that the Schools spake in earnest, unless they did fatally even unto this day, confirm those Positions by the practical part.

For a Conclusion, I will as yet add one thing: *Whatsoever hath been once corrupted in the body, never returns again into favour; but the blood of the veins, however corrupted it may seem to be, returns again into favour:* Therefore it was not once corrupted.

The Major proposition is proved, because Corruption in us is an effect of the sequestration of vital dispositions, and so it presupposeth a privation, and death of the corrupted body, or matter it self.

The Minor proposition is proved, by those who are cured of the Plague, Pleurisie, and

38 and a Fever, without the drawing out of blood. And likewise, if the blood be ever to be reckoned putrefied or corrupted while existing in the veins, that blood shall especially be that of the Hemeroides; but this is not corrupted, although it be as it were almost hunted out of the veins: Therefore the blood is never to be reckoned putrefied in the veins.

39 Whole Chyrurgery proves the *Major* proposition concerning Ulcers bred from an accidental happening of the Hemeroides or Piles: But I prove the *Minor*, because I compound or compose a mettall: A Ring made whereof, if it be carried about one, the pain of the Hemeroides is taken away in the very space of the Lords Prayer: and the Piles, as well those within, as without, vanish away in twenty four hours space, how greatly soever those veins may tumefie or burgen; Therefore that blood is received into favour, and they have themselves well at ease.

That Ring also prevails in the strangling, and motions of the womb, and very many Diseases: The Description, and manner of composing whereof, I deliver in the Treatise upon those words; In Words, Herbs, and Stones, there is great vertue, where I speak of the great vertue of things.

CHAP. III.

The Doctrine of the Antients concerning Circuits, is examined.

1. The causes of Feverish Circuits in the Schools. 2. The first error. 3. Galen is accused of error. 4. A quaternary of humours, why suspected. 5. The great and stubborn blindness of the Schools. 6. Galen is hissed out of the place of intermitting Fevers, by many perplexities issuing from thence. 7. An account of Cholera necessary for the Fit or coming of a Tertian Ague according to the Schools. 8. He is refuted. 9. From their Suppositions it is concluded, that there cannot be a Plethora in a Fever or Ague on every other day. 10. A begging of the principle in the Galenists. 11. Galen being ignorant of Anatomy, hath copied out many books concerning Anatomy. 12. Unhappy Speculations of healing invented by the Devil to the destruction of Mortals. 13. An argument on the contrary drawn from Cases or Receptacles. 14. That yellow, and black Cholera are not entertained in the Spleen, and little bag of the Gawl. 15. Against Astrologers who derive the Circle of a Fever on the Stars. 16. The similitudes afore-read in the Schools, do not square. 17. Some arguments against the Doctrine of the Schools. 18. The desert of Fernelius. 19. The rashness and unconstancy of Paracelsus. 20. That man is not a Microcosm or little world, if the holy Scriptures are to be obeyed. 21. Paracelsus deceived.

1 THE Shools say, the causes of set Circuits are, to wit, because as much Phlegm is [daily] generated, as there is of Cholera every other day, and as there is of black Cholera every third day.

I gratulate the language of our Countrey, which would willingly want these same names drawn from a Grecisme: But the Schools do not thus teach the effective cause, but only the remote cause, which they call that of [Sine qua non] or that without which it is not: Therefore I am deservedly angry, that the Schools have not feigned a fifth Humour for a Quintan Ague, nor an half, and a one and a half humour for the

the Fever *Epiolos*, and for Semiterrians. Likewise, that they have neglected a doubled yellow Choler for a double Tertian, nor that they have made mention of a doubled black Choler for a double Quartan: That they have not invented a wandring, and uncertain humour for a wandring Fever; or Humours continuing, and undessantly substituted for continual Fevers, exasperating themselves every day, every other day, or every third day: And lastly, a slow humour for a slow Fever. At leastwise, they ought to have explained, if putrifying blood be changed into yellow Choler, why it is wholly converted into corrupt Pus: Why doth not purulent, thick, or mattery blood cause a burning Fever in a Consumption of the Lungs; and why do not yellow expectorations or spittings out of the breast, produce a Tertian, but an Heetick Fever; and that presently after meat: Wherefore a Quaternary of Humours for so great a Catalogue of Fevers, and other diseases, being as yet daily increased, ought to be suspected of every one.

But as to what belongs unto the seat of the putrified humours of Fevers, *Galen* is so alike stupid herein, that it had shamed me to lay open his errour, if the Schools did not as yet to this day risily defend the same unto the destruction of Mortals: they craving respect rather from Antiquity than from the Truth: as if the fountain of Wisdom were drawn out in *Galen*, who that he might find the Causes of a fet trembling in Fevers, hath writ nothing but old wives Fables; the which as oft as I call to mind, I ingeniously admire that so many wits could subscribe thereunto ever since the dayes of *Galen*: wherein surely I am amazed at the great sluggishness of wits as to a diligent search, they assenting unto false principles lest the right of disputing against denyers should be forestalled from them.

I will therefore no longer speak to *Galen*, but unto the *Schools*: I wish therefore that they may explain to me, by what Conduiter, manner, and passage, a putrified humour may at every fit, come from the shops of the humours unto the utmost parts of the veines which are terminated into the habit of the Body, or into the flesh and skin? For if it were putrified before it came unto the slender, and utmost extremities of the veines; why is one alone (to wit, Choler, or Phlegm) separated from its three fellowes, that as a banished humour, it may putrifie far from its own Cottages? Or who is that silly Separater, which plucks the harmless humour from its own composed body for so absurd ends? Why therefore, the same Separater remaining for Life, doth not the same Fever continue for Life? What *School-master* admonisheth this Separater of his Errour, that he may seasonably repent? At leastwise, if the utmost parts of the veines do not corrupt that putrified humour, the veines themselves shall be more putrified, and so they shall labour with an unexcusable Gangreen. But if the Cause which calleth the guiltless humour unto it self, subsisteth in the very extremities of the veines, that it may putrifie the same in its own possession: Yet by a greater *breviary*, it should execute that in the Blood nigh to it self, over which it hath a stronger Right, and from whence it hath as well a liberty to separate Choler, or phlegm, as the same thing is otherwise proper unto a solutive Medicine.

Again, If it listeth it to have prepared a putrified humour out of the righ blood, it shall in vain expect an agreeable quantity of Choler for full two dayes space: But if that humour shall putrifie before it could reach to the utmost parts of the veines, then the *Schools* contradict themselves, and the seat of intermitting Fevers shall not be in the habit of the Body, but in the first shops of the Humours.

In the next place, If at one onely turn of a fit, the whole putrified humour be dispersed out of the veines into the habit of the Body, even for the consumption of it self, why at least, shall that *Separater* or *Driver* (seeing nothing is moved by it self which is not vital) be less generous in the Bowels, than he that is placed in the utmost parts of the veines? At length, for what end of Doatage, shall there be this passage of the putrified Humour from the *Mesentery*, through the Liver, and Heart, even unto the extremities of the veines? It is a matter full of danger; and it is to be feared, but that by its frequent passage it may soon defile the whole blood with its corruptions, and deadly gore: For let it either be a great lye of *Galen*; or humane nature voluntarily meditates of its own ruine. And by this meanes, the necessity of Revulsion boasted of, by cutting of a veine, falls to the ground. For truly, the putrified humour is by the voluntary force of intermitting Fevers, at set hours Revulsed, or pulled back from the Nest of its Generation; Yea it issues of its own accord unto the utmost parts of the veines: unless perhaps, that Revulsion be accounted dangerous, which wholly ought to be made by the Heart through the hollow vein, as well in intermitting Fevers, as by the cutting of

a vein. And then, either the feverish matter is at every fit wholly drawn out of the Nest of its nativity, or not wholly; if totally, there shall be no cause of return; if not totally, it is exhausted. Why shall a new humour which putrifies at every future fit, no more move an Aguish fit by its putrefaction, than by its expulsion? For truly, there is greater labour and pain while corrupt *pūs* is in making, than when the *pūs* is made. Why in that case, shall not the seat of Fevers be rather in the place of putrefaction, than in places through which it passeth while it is expelled? Why, I say, the appetite returning, Thirst and Watchings being absent (To wit, in the resting dayes of intermitting Fevers) shall Choler, or phlegm putrifie in the Bowels? And why doth not the putrefaction thereof disturb the Family administration of the shops of the Humours? Why shall black Choler, which should be made on the second day of the week, putrifie in two dayes space into a ripe putrefaction; and that which should be made on the following day, putrifie as much in one onely day, as the former putrified in two dayes? If that which was joyned of them both, causeth the fit of a *Quartane* on the fourth day of the week? Why doth not that which is made on the second day, stir up its own fit on the fourth day; and that which is made on the third day, not likewise stir up its own Tumult on the fifth day? And consequently, if any be made on the fourth day of the week; why doth it not frame a fit on the sixth day? The shoulders of *Physicians* are lifted up, their Browes are bent, and hidden properties are accused, while as they are constrained to answer unto things known by Sense, by believed, and supposed madneses.

Why at length in the rigours or shaking fits of a *Tertian*, will they have that which is vomited up about their Beginnings, to be Gail: and say, that Nature bends that same way, if on the contrary, the guidance of Nature doth in the same interval of time, proceed from the Center unto the utmost parts of the Veines? because Nature doth not at one onely instant, stir up two opposite motions within, and without, especially from the cause of one Excrement, which is accounted the Gail: Why doth not that vomiting take away as much from the sharpness of the fit, as there is a plentiful expulsion of that excrement which they suppose to be the very matter of a *Tertian*? But if in a *Tertian*, a residing Choler remaineth in its own shops after the fit, why doth it rather putrifie new Choler, than the humours radically annexed to it self? After what manner do bitter Vomiting, Thirst, and so great Tokens of hurts molest the stomach, while as most of the Balast of the malady shall passe over unto the extreame parts of the veines that it may provoke Rigours. But those who carry the marks of a *Cautery*, do see, that two dayes after Fevers, a spare quantity of, or no excrements are wiped off: the which surely, should be many, if so many feverish filths should at every fit slide unto the utmost parts of the veines and habit of the Body.

The *Schools* triumph in the Causes of *Rigour*, they being as prettily feigned, as blockishly believed. But why doth *Galen* give more heed unto the quantity of an humour, than to the ready obedience of the same? Should not Choler, although lesse in quantity, by reason of its heat, and flowing, be more inclinably obedient unto the Clientship of a putrefactive humour, than phlegm otherwise was? But why doth not Choler move a fit daily, if a lesse moiety thereof be sufficient for a *Tertian*? To wit, while as the greater moiety thereof is rejected by Vomit?

Lastly, They ought to have told, how many ounces of a putrified humour should be required for every fit: whether six, or seven? Truly, oft-times a double quantity thereof is rejected by vomit about the beginning of a *Tertian*, and the fit is nothing the lesse: Therefore if as yet, seven ounces have proceeded unto the mouthes of the Veines, and twelve ounces were voided by vomit, Therefore 19 ounces are requisite for a *Tertian*: Whereof, if thou shalt take the half: To wit, 8 ounces of yellow Choler every day; and by consequence, a double quantity of phlegm, there shall be 17 ounces thereof, and at least 4 ounces of black Choler every day, and at least as much of Bloud every day, as there is of phlegme; That is, 17 ounces, which being joyned together, 46 ounces shall be daily made, even in an abstinentious Feverish person; Let him give credit to these Fables that will, and let the *Musitian* make an Harmony of these pipes, that can.

I at least conclude, from the supposed dreams of the *Schools*, That there ought in no wise to be the cutting of a Veine; as neither a laxative Medicine for those that have a Fever, if so much of humours be bred in him; seeing as much is consumed in an abstinent Feverish person; because his appetite, digestion, and Food failing; Yet it is of necessity, that this weight be recompensed out of the Masse of the Bloud. Therefore an emptying is not to be instituted in a Feverish or Aguish person, who abstaineth

eth for the space of two dayes. But I pray, from whence hath *Galen* known; That as much of yellow Choler is made every other day, as there is of phlegm daily, and of black Choler every third day: Especially, who is proved by *Andrem Vesalius* of *Bruxels*, and the Prince of *Anatomists*, in 106 places, never to have pryed into a humane dead Carcase? For if *Galen* writeth this without proof, at leastwise, the *Schools* were not bound to subscribe to his Doatage. But if he learned this, as being perfectly instructed by *Fevers* themselves: Verily, he could not refer this same thing into the effect, and also into the cause of one thing. For it must needs contain an absurd and blockish begging of the Principle, to produce the same thing to be for a cause, and effect for it self: Namely, That a *Tertian* happens from yellow Choler putrified every other day, and a *Quartane* from black Choler putrified every third day, because as much of yellow Choler is made every other day, as there is of black Choler in full three dayes space. 10

And again, Let him prove the truth of this matter, That a *Tertian* assaults us every other day, and a *Quartane* in the space of three dayes, because as much yellow Choler is made every other day, as there is of black Choler in three dayes space. Surely, miserable are the Speculations of Healing, which are handed forth in the spring of young men, being commanded to serve the sick, and hitherto adored by the *Schools*: To wit, From whence unprosperous curings of Diseases daily succeed, to the destruction of the Christian World, and salvation of Souls. 11

But at leastwise, if yellow Choler should exceed Melancholly or black Choler in one part and an half of its proportion, the Spleen exceeds the little bag of the Gaul six times at least: If therefore it be supposed, that the *Schools* do teach with *Galen*, That as much of Gaul or yellow Choler is made every other day, as there is of black Choler every three dayes; and the Spleen be the Case or Recepracle of black Choler, and the little bag of the Gaul be the sheath of yellow Choler; the Creatour hath either erred in his Ends, in framing the very Recepracles of those otherwise than *Galen* hath determined: or the Gaul, and Spleen were not the *Butteries* of the *Fables* of the *School* of *Medicine*. 12

Therefore others whom the devices of *Galen* concerning the Circuit of *Fevers* did not satisfie, have begged *Astrology* for their ayd; because a *Fever* doth sometimes return at set hours. But these also are dashed against other straits, while as *Fevers* begin at all houres: and likewise, do delay, or forestall for some houres, yea are silent, and sleep for some tuns. Whence they have not sufficiently confirmed, That mans nature is constrained at the pleasure of the Stars: as neither that there is a wedlock of the matter of a *Fever*, with the Stars: They are Rubbish and vain Tinklings poured over credulous eares. 13

Others also, at length suppose, that they have given themselves satisfaction to the Question by Similitudes, if they shall say, that *Fevers* have themselves after the manner of other Seeds: To wit, some whereof do quickly bud, as the *Water-cresse*, but that of *Parfly* far more slow. But the example availes not, because it resolves one doubt by another: For Seeds which are the more slowly resolved in moisture by reason of their Gummy oyliness, do also more slowly bud, as also others more readily, which obtain a nutriment nearer to the juyce of the earth: wherefore such a Similitude hath no way regard unto *Fevers*, wherein, they will not have fits to be made by reason of an easie or difficult resolving, but by reason of a scanty, or plentiful afflux of putrified humours. 14

Otherwise surely, phlegm being the most estranged from putrefaction, should scarce afflict on the seventh day: whereas in the mean time, black Choler (which is reckoned to be most like unto a dead Carcase, or flesh) should far sooner putrifie. But at leastwise, the Doctrine of the *Schools* concerning the cold fit and circuit of *Fevers*, standing, it must needs be, That a *Tertian* is cured by exhausting of the matter in the fit, and by a defect of new Chole r requisite for a future fit, if the Patient shall abstain from meat and drink for full two dayes space; But the Consequence is false, therefore also the position of *Galen*. But if the *Schools* do teach and say, that then new Choler is dissolved out of the venal blond; Yet this is to feign Nature to be more solicitous, that she may preserve the *Fever*, than otherwise the Life, and Bloud the Treasure of Life. 15

Again, That Choler being separated or made out of the Bloud if it be putrified, why is it not banished by the veines, together with the Choler of the foregoing fit, the which was already before deteined in the veines with the Bloud? or hath perhaps that remaining and putrified Choler, fore-known that there would happen an abstinence of two days: 16

To wit, that it might reserve it self for this defect, for a continuance of the *Fever* or *Ague*, which otherwise should perish through want of *Choler*? Or hath Nature well pleased her self in the preserving of putrified *Choler*? But if indeed that *Choler* issuing out of the veines be not putrified; truly, now Nature is mad and outrageous, because she rather dissolves the *Bloud*, that she may have that which may putrifie for the continuation of a future *Fever*. But the Schooles of *Galen* confess that *Choler* to be putrified, and that a putrified humour is poured out through the veines at every fit, and brought into the slender extremities of the veines, and that is the cause of the trembling of the fits, and great cold; To wit, the putrefaction of which humour, when it is the more intense or heightened in the same place, that it straightway after causeth so great a heat.

18 I have accounted these Doctrines to be dry stubbles, unworthy Fables, miserable old Wives Fictions, and ignorances most pernicious unto mankind. But surely, *Fernelius* first discovered this Ignorance of the Schooles: Wherefore, *Rondeletius* and the followers of *Galen*, inveigh against *Fernelius* as a forsaker of, and an Apostate from the School of Medicine.

Fernelius therefore first smelt out the Nest of intermitting Fevers to be about the stomach, *Duodenum*, and *Crow*, and indeed he fixed the seat of continual Fevers about the heart: but he durst not to decline from the ancient Rule of curing Fevers: For he had begun openly to dispute against the foregoing Schooles, for the Nest of Fevers; but afterwards he hid himself among retired places: for he not being able to rid himself of the strawy Bonds of putrified Humours, suffered the essence and knowledge of Fevers to be snatched away from him.

19 But *Paracelsus* being affrighted with the Rigour of Fevers, perswading himself that he held the knowledge of a Fever by the eares, and pleasing himself with his own Allegorical invention of a *Microcosme*, defines a Fever to be a Disease of *Sulphur* and *Niter*: and elsewhere again, to be the Earth-quake of the *Microcosme*: As if *Sulphur* and *Nitre* were made far more cold than themselves, while they are separated from the mud (or *Limbus* as he saith) of the *Microcosme*; and moreover, after some hours, were of their own accord inflamed with the fire of *Aetna*. For as *Galen* every where stumbled in the searching into Causes, and so therein bewrayed himself not to be a *Physitian*; (the Name of whom he saith, is the Finder out of the occasion) So *Paracelsus* by a wonderfull Liberty, slid into the Similitudes or Allusions of a *Microcosme* or little World, unworthy a *Physitian*: Because that was a hard Law, which had violently thrust man into the miserable necessities of all Diseases, nakedly, that he might resemble the *Microcosme* or great World.

21 I certainly gratifie my Soul, that I shew forth the Figure of the living God, but not of the World. This good man was deceived, because he knew not that fire doth nowhere kindle, unless it be first inflamed; neither however he hath feigned, that there is a Flint and Steel in us, and also a Smiter in the point of rubbing of the Flint. Surely, there was no need of these things, as neither of Gun-powder, for a feverish heat, unless we are burnt at the first stroak, and cleave asunder in the middle. An actual matter therefore of *Sulphur* and *Salt-peter* is wanting in us, a connexion of them both is wanting, an actual fire is wanting: And lastly, a Body is wanting which may undergo that kindling at one onely moment. Therefore, let the Causes and originals of Fevers in the Schooles, be Trifles and Fables.

CHAP. IV.

Phlebotomy or Blood-letting in Fevers, is examined.

1. One onely reason against humours, others elsewhere.
2. A universal proposition for Blood-letting, Galen being the Author.
3. A Syllogisme against the same Galen.
4. A Logistical or rational proof.
5. That a Plethora or abounding fulnesse of good blood, is impossible.
6. That corrupted blood doth never subsist in the veines.
7. That there cannot be said to be a Plethora, in a neutral state of the blood.
8. That cutting of a vein is never betokened by the Positions of the Schooles.
9. What a Cachochymia or state of bad juyce in the veines may properly be.
10. That co-indications instead of a proper indication, and those opposite to a contrary indication or betokening, do square amisse.
11. A proposition of the Author against cutting of a veine in a Fever.
12. The Schooles disgrace their own laxative Medicines, by their tryals of the cutting of a veine.
13. The ends of co-betokenings.
14. A fore-warning of the Author.
15. After what manner, the letting out of blood cooleth.
16. A miserable History of a Cardinal Infanto.
17. We must take special notice against Physitians that are greedy of blood.
18. A guilty mind, is athousand witnesses.
19. An argument drawn from thence.
20. The essential state of Fevers.
21. An explaining of the foregoing argument, concerning cooling, and the privy shifts of the Schooles.
22. That there is not a proceeding from one extream unto another, is badly drawn from Science Mathematical into Medicine.
23. It is a faulty argument in healing.
24. The argument from the position of the Schooles is opposed.
25. The false paint of the Schooles, from stubborn ignorance.
26. The faculties obtain the chiefdom of betokening.
27. Hippocrates, concerning great Wrestlers or Champions, is opposed: but being badly understood.
28. The differences of emptyings.
29. A Fever hurts lesse than the cutting of a veine.
30. The obligation of Physitians.
31. A general intention in Fevers, and the cutting of a veine opposite thereunto.
32. Science Mathematical proveth, that cutting of a veine, doth alwayes hurt.
33. The uncertainty of Physitians proves a defect of Principles.
34. Cutting of a veine cannot diminish the cause of Fevers.
35. An argument from a sufficient enumeration.
36. Another from the quality of the blood.
37. Whither the Schooles are driven.
38. Vain hope in the changes of blood let out.
39. That the co-indication of Phlebotomy for Revulsion, is vain, as well in a Fever, as in the menstrues.
40. Derivation in local Diseases is sometimes profitable: but in Fevers impertinent.
41. Cutting of a vein is hurtfull in a Pleurisie.
42. The Schooles may learn from the Country Folk, that their Maximes are false.
43. Revulsion a Rule in Fevers.
44. What Physitians ought to learn by this Chapter.

BEfore I proceed unto further Scopes, I ought to repeat what things I have elsewhere demonstrated in a large Treatise: To wit, That there are not two Cholers, and phlegme in Nature, as the constitutive parts of the venal blood; but that the Treatise of Fevers required me to be more brief: especially, because those very things do of themselves go to ruine in this place; where there is no mention made of Humours, except putrified ones, since an Animal or living Creature that is putrified, is no longer an Animal.

I will therefore examine onely the two universal Succours: To wit, Blood-letting and Purging, as the two pillars of Medicine; and the which being dashed in pieces, the whole Edifice falls down of its own accord, as it were into Rubbish: and these Succours being taken away, Physitians may forsake the sick, they not having Remedies, besides the Diminishers of the body and strength; all which I will peculiarly touch at.

For indeed according to the consent of Galen, in every Fever (a Heftick one excepted) cutting of a vein is required. Therefore for the Schooles, and custome of this destructive Age, I state this Syllogisme.

Phle-

3 *Phlebotomy* or Bloud-letting, is unprofitable wheresoever it is not shewn to be necessary: or where a proper Indication is wanting unto it; But in *Fevers* it is not signified to be necessary: Therefore Bloud-letting in *Fevers* is unprofitable. The Major proposition is proved, because the end is the chief Directress of Causes, and the Disposer of the means unto it. Wheresoever therefore the end sheweth not a necessity of the means, things not requisite are in vain provided for that end, especially where from a contrary betokening, it is manifest that the blood is not let out without a losse of the strength: such means therefore are rashly instituted, which the end shews to be vain, unprofitable, and to be done with a diminishment of the strength.

But the Minor proposition, *Horatius Augenus de monte Sancto*, professeth in three Books; Teaching with the consent of the *Universities*, That a *Plethora* or a too much fullness of the veines alone, that is, the too much abounding of Bloud is the betokener of *Phlebotomy*; nor that indeed directly for the curing of *Fevers*, but for the Evacuation of a fullness: But a *Plethora* never subsisteth in *Fevers*, therefore Bloud-letting is never betokened in *Fevers*; and by consequence this is altogether unprofitable. The Conclusion is indeed new and Paradoxal, yet true, Which thing therefore for that cause shall be therefore to be proved by many Arguments.

Galen himself proves the Sublimption: Teaching, That at every fit of *Fevers*, more *Choler* is pufft away than is generated in two dayes. In the mean time, the other members do not cease to be nourished with accustomed blood: That is, besides the consuming Caused by the *Fever*, they also consume their own allotted quantity of wonted Blood:

4 The which, in the foregoing Chapter, from the humour cast up by vomit, I have reduced into a Computation. But now that very thing is to be pressed with a greater connivance: Wherefore, if in him that is in good health, eight ounces of blood are daily made, it must needs be, that as many also are daily spent for nourishment: or otherwise, that a man should soon swell up into an huge heap. What if therefore eight ounces of blood do daily depart from him that is in good health: certainly, the *Fever* shall consume no less. Therefore, seeing there is none, or but a little appetite and digestion of meats, and sanguification, of necessity also, too much abundance of blood, if there were any at the beginning, shall fail presently after two dayes, and the betokening thereof shall cease for the letting forth of blood in him that hath a *Fever*. But that presently in *Fevers*, there is no longer a *Plethora*; as many do see this, as do undergo ulcers by a *Cantery*: To wit, the which presently after *Fevers* are dried up, nor do they afford their wonted pus.

5 But first of all we must take notice, that the Strength or Faculties can never offend through abundance, nor so much as in *Mathuselah*: so neither doth good blood offend through a too much abounding; because the vital Faculties, and Blood are Correlatives: Because according to the Scripture, the *Soul* or *vital Spirit* is in the blood.

6 By Consequence therefore, there can never be a *Plethora* in good blood.

7 But on the other extream, I have demonstrated in a foregoing Chapter, That corrupt blood is never contained in the veines: therefore if there be ever any possible *plethora* of the veines, that ought to consist in a middle state of the blood, between a corrupted and very healthy one: whether we consider the same state of decay, and neutrality, or next, as it is mixed of both: at leastwise the *Galenists* may remember, that good proceeds from an entire cause, but evil from every defect. And so that this state of the blood is not called a *Plethorical* or abounding one, but a *Cacochymical* one or state of a bad juyce: Nor that it desires the cutting of a vein, but rather a Purgation, which may selectively draw forth the bad, but leave the good.

8 And so, that by their Positions it is not yet proved, That the cutting of a vein is in any wise betokened: For according to the truth of the matter, I have already shewn before, That a state of ill juyce doth not consist in the veins, the which indeed is onely a disturbing of the Blood: for the easing whereof, an exhausting of the troubled blood is not so much signified, as a taking away of the affect of the Disturber: Especially, because it is the more pure blood, which passing through the Center of the heart, hath obtained its own refinement: and therefore, that which is drawn out of the Elbow, and is first brought forth, shall be the more pure, but the more impure blood shall be left within.

Furthermore, since it is now manifest, that a *Plethora* is wanting in *Fevers*, which may require a letting out of blood, and that thing the Schools have after some sort smelt out; they have instead of an indication or betokening sign, substituted some co-indications or mutual betokenings, as if they were of an equal weight with a surable indication

cation in nature; and out-weighing a contrary indication; the which, after another manner, surely, seeing it is drawn from a conserving of the strength, ought wholly to obtain the Chief-dome altogether by that Title, that every *Fever* is quickly, safely, and perfectly curable without cutting of a vein; For indeed, for all so divers putrefactions of retaining Humours, and *Fevers* issuing from thence, they presently make use of the one only succour of cutting of a vein, because it abundantly (as they say) succours, and is stopped at pleasure: By which distinction at least, they after some sort defame their own laxative medicines: For they say, although the cutting of a vein by a natural, and one only indication of itself, seems to be required by reason of a Plethora: yea nor that it doth properly take away putrified humours; yet it cooleth, it unloads the Fardle of the veins, reneweth, or refresheth the strength, takes away part of the bad Humour together with the good, and by derivation, and revulsion, stops, pacifies, and calls away the flux of humours made unto the nest of putrefaction: wherefore nature feeling refreshment, is the more prosperously, and easily busied about the rest.

They are good words (saith the Sow) while she eats up the penitential Psalms, but they do not profit a hunger-starved swine.

Such indeed are co-indications, whereby they perswade the destruction of Mortals to be continued, and whereunto I will give satisfaction in order.

But before all, I will have it to be fore-admonished, that although in a more strong and full body, there is not a notable hurt by letting out the blood, yea although the sick may oft-times seem presently to be eased, and also to be cured: yet cutting of a vein cannot but be disallowed, seeing that *Feverish* persons are more successfully cured without the same: For however at the first, or repeated cuttings of a vein, the cruelty of *Fevers* shall oft-times slacken: Surely that doth no otherwise happen, than because the *Archeus* much abhorreth a sudden emptying of the strength, and an undue cooling, and so neglects to expell the *Feverish* matter, and to perform his office: But they who seem to be cured by blood-letting, surely they suffer a relapse, at least they obtain a more lingering, and less firm health: which Assertion the *Turks* do prove, and a great part of the world, who with me are ignorant of the opening of a vein, because it is that which God is no where read to have instituted, or approved of, yea not so much as to have made mention thereof.

But as to what belongs unto the first scope of a co-betokening sign, which is called, *Cooling*;

Truly the letting out of the blood, cooleth by no other title, than as it filcheth from the vital heat: But not that it obtains a coolifying, and positive power: In which respect at least, such a cooling ought to be hurtful. Why I pray in a *Hedrick Fever* do they not open a vein? Doth not that *Fever* want cooling? or doth it cease to be a *Fever*? But blood is wanting in *Hedrick Fevers*; wherefore through defect of blood, and strength, there is an easie Judgement of hurt brought by *Phlebotomy*, which otherwise the more strong faculties do cover.

In the year 1641. Novemb. 8. the body of Prince *Ferdinand*, brother to the King of Spain, and Cardinal of *Toledo*, was dissected, who being molested with a *Tertian* ague for 89 dayes, dyed at 32. years of age: For his heart, liver, and lungs being lifted up, and so the veins, and arteries being dissected, scarce a spoonful of blood flowed into the hollow of his breast: Indeed he shewed a liver plainly bloodless, but a heart flaggy like a purse: For but two dayes before his death, he had eaten more if it had been granted unto him. He was indeed, by the cuttings of a vein, purges, and leeches so exhausted, as I have said, yet the *Tertian* ceased not to observe the order of its intention, and remission. What therefore hath so great an evacuation of blood profited? or what hath that cooling plainly done, unless that those evacuatorers were vain, which could not take away so much as a point of the *Fevers*.

Is that the method of healing which makes a Physician, whom the Almighty hath created, and commanded to be honoured, by reason of the necessity of him? If that method knows not how to cure a *Tertian* ague in a young man, to what end shall it conduce? Is that the art whereof the infirm and unhealthy person stands in need? I wish, and wish again, that that good Prince had not made use of it! who when he returning from *Corbrachum*, was saluted by the Senate of *Bruxells*, recovering from the agony of death, by reason of the diminishment of his blood, and strength, then walked in good health about his Chamber.

Physicians therefore abhor to expose their feverish persons to the encountering of cold things, to wit, whereby they might presently, and abundantly experience the vertue of cooling

cooling things by a manifest token, because they put not much trust in their own rules of Heats and Coolers : For since it is already manifest, that the whole heat in a Fever is that of the very vital spirit itself ; it follows also, that the cooling which is made by cutting of a vein, is meerly that of the vital spirit, and together also an exhausting of the blood, and an impoverishment thereof : For if a Fever be to be cured as a distemper, by cutting of a vein as a cooling remedy : Alas, the contrary is manifest ! by the exhausting of all the blood out of the Prince the Infante of *Spain* : In whom as yet, but the day before his death, the Tertian Ague kept its fits : (so great cooling not hindering it) and

19 if others intend a curing even in a Quotidian, only by cold (which they write to be kindled of putrified Phlegm) at leastwise that cooling should be far more easily obtained by exposing the sick half naked unto the blowing of the North, or West wind, or by hanging him up in water, or a deep well, until he should testify that he were sufficiently cooled : For so they should presently, and abundantly perfect a cure, if their conscious ignorance did not within condemn their own feverish essence of heat : Therefore a Fever is not a naked Tempest of heat, but an occasional vitiated matter is present ; for the

20 expelling whereof, the *Archeus* being as it were wroth, doth by accident inflame himself : The which as long as it shall be neglected in the Schools, the curings of Fevers will be rash, destructive, and conjectural, therefore none shall owe any thing worthy of giving thanks unto Physicians, seeing they are cured by the voluntary goodness of nature : and I wish they were not put back by Physicians.

21 But unto the argument of curing by sudden cold, the Schools will answer, that there is a perilous departure from one extremum unto another : By which excuse of their ignorance they stop the mouth of the people, as if they spake something worthy of credit : not taking notice, that they therein contradict themselves, while as they praise, and prefer the cutting of a vein before laxative medicines, chiefly for that end, because it presently and abundantly succours by cooling, and therefore they have given it the surname of a speedy and universal succour : For they constrain their own impotency founded in ignorance, unto the will of a Maxim badly understood, and worse applied.

22 For truly, it is not to be doubted but that it is lawful presently to cut the halter of him that is hanged, that he who was deprived of air, may enjoy it as soon as may be : Likewise that it is lawful presently to place him that is drowned, in a steep situation, that he may cast back the water out of his lungs : That it is lawful, I say, to draw any one presently to the bank : and that it is lawful presently to free a wound from its indisposition, and to close it with a scar : For so very many wounds are closed in one only day, because a solution of that which held together, wants nothing besides a re-uniting of it self : That it is lawful presently to repose a broken, or displaced bone : Likewise, that it is lawful in the Falling Sickness, Swooning, Fainting, Cramp, to recall the weak as soon as one can, presently to loosen the detentions of excrements, and presently to stop the excessive flux of womens issues : For neither must we think, that nature rejoiceth in her own destruction, and that from an healthy state, she indeed lets in sudden death, but refuseth a remedy, which may suddenly repell a disease ; otherwise she should not do that which in things possible, is most exceeding good to be done, as neither should every thing desire to be, and be preserved.

In Science Mathematical indeed, it is determined as impossible to proceed from extremum to extremum without a mean, and that *Medium* wholly denies all interruption : the which, if we shall grant in natural things with a certain latitude, we shall as yet be accounted to have done it out of hand, and that in the best manner : And so that neither is it lawful to wrest that of Science Mathematical unto curings.

I confess indeed, that it is not lawful to draw out a dropie abundantly by an incision of the Navil, at one only turn ; as neither to allure forth all the corrupt *pus* out of a great Aposteme, nor to bring one that is frozen by reason of cold immediately to the Chimney, nor abundantly to nourish him that is almost dead with hunger : Yet surely a slow and

23 necessary progress of Mediocrity, as such, or a proceeding from one extremum unto another, doth not conclude that thing, as if nature were averse unto a speedy help : Since this betokening is natural, nearly allied, pithy, and intimately proper unto her self : But those things are forbidden, because a faintness of the strength depending thereupon, would not bear those speedy motions.

The Schools therefore by a faulty argument, of the cause, as not of the cause, drive the sick from a sudden aid which they have not, that they may veil their ignorance among the vulgar, with a certain Maxim being badly directed : For as often as a Cure can be

had

had without the loss of strength (for the faculties do always obtain a chiefdome in indications) by how much the more speedily that is done, it is also snatched with the greater Jubily or joy of nature : Even as also in Fevers, I have with a profitable admiration observed it to be done with much delight: Therefore (in the terms proposed) if a Fever be a meer heat besides nature, and all curing ought to be perfected by contrary sub-
 24
 duers; Therefore it requires a cooling besides nature, to wit, that contraries may stand under the same general kind; That is, every Fever should of necessity be cured by much cold of the encompassing air, & especially, because the cold of the encompassing air collects the faculties, but doth not disperse them: But the consequence is false; Therefore also the Antecedent. Therefore the Schools do not intend by cutting of a vein, the cooling of heat, but chiefly a taking away of the blood it self, and a mitigation of accidents which follows the weakened powers, or they primarily intend a diminishment of the strength, and blood: It being that which with a large false point, they call a more free breathing of the Arteries.

But I do alwayes greatly esteem of an indication which concerns a preserving of the strength, and which is opposite unto any emptying of the veins whatsoever, because the strength or powers being diminished, and prostrated, the Disease cannot neither be put to
 25
 flight, neither doth any thing remain to be done by the Physician: Therefore Hippocrates decreeth, That Natures themselves are the Physitaneesses of Diseases; because the indication or betokening sign which is drawn from a preserving of the faculties, governs the
 26
 whole scope of curing: As therefore Reason perswades, that the strength is to be preserved; so also the blood, because this containeth that.

Hippocrates indeed in a Plethora of great Wrestlers or Champions, hath commanded blood to be presently, and heapingly let out; and that saying the Schools do every where
 27
 thunder out in the behalf of the cutting of a vein: But that is ridiculously alledged for the curing of Diseases, and Fevers: For he had not that thing to be done for fear of a Plethora, however their veins may sufficiently abound with blood: but only, lest the vessels being filled, they should burst, and cleave asunder in the exercises of strength: otherwise, what interposeth as common between healthy Champions, and the curing of Fevers: For there is no fear of a Plethora in him that hath a Fever, neither that a vein should be broken through exercises; and moreover we must note, that the emptyings of the blood are on this wise:

That the exhausting of the strength or faculties which is made by carnal lust, is unrepairable, because it takes away from the in-bred spirit of the heart: But the exhausting which
 28
 is made by the cuttings of a vein, is nigh to this, because it readily filcheth away the in-flowing *Archeus*, and that abundantly. But a Disease, although it also directly oppose the strength, yet because it doth not effect that thing abundantly, but by degrees, therefore it rather shakes, and wears out the strength, than that it truly exhausteth it: Therefore the restoring of the faculties which are worn or battered by a Disease, is more easie than that of those which are exhausted by cutting of a vein.

For they who in Diseases are weakened by the cutting of a vein, are for the most part
 29
 destitute of a Crisis; and if they do revive from the disease, they recover by little and little, and being subject to be sick with many anguishes, in a long course of dayes, and not without the fear of Relapses. But they who lay by it with a Disease, without cutting of a vein, are easily restored, and recovering, they soon attain unto their former state: But if they being destitute of remedies, shall also sometimes come unto an extremity; yet Nature attempts a Crisis, and refresheth them, because their strength, although it was sore shaken by the Disease, yet it perished not, as not being abundantly exhausted by the lettings out of blood.

Wherefore a Phyitian is out of conscience, and in charity bound to heal, not by a sudden lavishment of the faculties, as neither by dangers following from thence, nor
 30
 also by a necessary abbreviation of life; according to the Psalm, *My spirit shall be lessened, therefore my days shall be shortened.*

And seeing that according to the Holy Scriptures, the life glistens in the blood; however plentifully thou shalt dismiss this, thou shalt not let it forth but with the prejudice of life: For the perpetual intent of nature in curing of Fevers, is by sweats; And therefore the fits are for the most part ended by sweats: But the cutting of a vein is Diametrically opposed unto this intention.

For truly, this pulls the blood inwards, for to replenish the vessels that were emptied of blood; but the motion of nature that is requisite for the curing of Fevers,
 31
 proceeds from the Center to without, from the noble parts, and bowels unto the skin: But that the cutting of a vein doth of necessity weaken, although the more strong and ple-

thorick persons may seem to experience, and witness that thing to be otherwise. If the sacred Text, which admonisheth us, *That the life inhabiteth in the blood, hath not sufficient weight in it*; at leastwise that shall be made manifest, if thou shalt offend in a more liberal emission of blood: For the strength and sick person do presently faint or go to ruine: Therefore in Science Mathematical, if six do notably hurt, three cannot but hurt, although not so sensibly.

- 32 But it is not permitted him to hurt nature, who ought to heal and restore the same, if nature her self ought to be the Physitianeſſe to her self, and by so much the more prosperous, by how much the more strong: For it is sufficient for a Physitian that the sick doth otherwise decay through the disease, with hungers, lack of appetites, disquietnesses, pains, anguiſhes, watchings, sweats, and with an unexcusable weakness; Neither therefore ought a faithful helper to add weakness unto weakness.

- It is a deceitful succour which the *cutting* of a vein brings, and the remedy thereof is so uncertain, that no Physitian hath hitherto dared to promise a future cure from thence. Every Artificer doth what he promiseth: For a Statuary undoubtedly prepares an Image, and a Shoemaker shoes: But the Physitian alone dares to promise nothing from his Art, because he is supported with uncertain foundations, being only by accident now and then, and painfully profitable; Because however thou shalt interpret the matter, that is full of ignorance which would cure by procured weakness: For by a sudden emptying out of the blood made by heaps, nature for the most part neglects the expulsion of her enemy; which expulsion notwithstanding, I have demonstrated to contain the whole Tragedy of Fevers, and Nature: Besides it is confessed, That the matter of a Fever doth not consist in a vein above the heart; and by consequence, that neither doth the *cutting* of a vein any way exhaust the occasional matter, or effectively cure by a direct intention of healing.

- 34 Again, If blood be to be let forth for a more easie transpiration of the Arteries, That at leastwise shall be in vain in the beginnings, and increases of Fevers, whenas the heat is not yet vigorous.

- 35 And seeing that blood is not to be let out in the state, as neither in the declining thereof; Therefore never: But that, not in their state or height it is proved, because a Crisis or judicial sign is hindered; seeing Nature (as they write) being very greatly letted or cumbered, strives with the disease, and being for the most part the Conqueresse, doth then least of all endure the loss of strength, and a calling away from the Duel: But if nature be conquered in the state of the Fever, what other thing shall the *cutting* of a vein then be besides meer Murder? If therefore it is not convenient to open a vein in the height of Fevers, while as there is the greatest heat, perplexity, and a most especial breathing of the arteries is required: Surely much less shall it be convenient in their beginnings, and increases; especially, because presently after the first days, the fear of a Plethora or too much fulness departs, and so there is a sufficiently easie Transpiration of the Arteries: But that diseases in their declining, do neither require, nor endure the *cutting* of a vein, it is so clear, and testified by the voice of all; That none ever attempts the *cutting* of a vein at the declining of a Disease.

- 36 Let us consider further, That in Fevers the blood in the veins is either good, or evil, or neutral: If it be good, it shall be good to have the good detained, because it addeth to the strength.

For as I have shewn elsewhere, the fear of a Plethora, if there were any, hath ceased, even presently after the beginning: But for that they will have good blood to be let out for cooling, and discussing of putrefaction; Truly both of them hath already been sufficiently taken away, and the imaginary good which they suppose, brings a real and necessary loss of the strength or faculties.

But moreover, the Schools teach, That the *cutting* of a vein is not commanded in a Fever, by reason of the goodness of the blood, the which indeed, they suppose to be evil, and putrefaction.

But I have sufficiently taught, That corrupted blood is not afforded in the veins as long as we live; and by consequence, that this scope of the Schools in *cutting* of a vein, falls to the ground: It behooves therefore that they demonstrate unto me a naughtiness of the blood, which may be without the corruption of the same: And then, that that blood is detained in a vein from the heart unto the hand, if they will have the *cutting* of a vein to be confirmed in as much as it is such, or as to revulsion: Let them teach I say, That bad blood is not in the first shops, and that blood being drawn out through the vein of the elbow, worse blood is not drawn to the heart, where the *vina cava* or hollow vein makes the right bosome of the heart.

Let

Let them likewise instruct me, that the upper veines being emptied, there is not a greater liberty, and impunity, whereby the hurtfull, and feverish matter may reach unto the heart, than before: So that instead of a discussing of the putrefaction (which in the truth of the matter, I have proved to be none,) a free passage of putrified ayr unto the heart, is not rather occasioned: whither indeed the vacuity of the emptied veines attracteth the blood from beneath. Let them shew I say, by what reason an afflux of blood, and diminishment of the strength through the Elbow, may hinder putrefaction, or may import a Correction, and renewing of that which is putrified. Let them also explain themselves what they will have meant, that cutting of a vein should be made, whereby the Arteries may the more freely breath; since putrefaction (if there were any possible to be in the veines) doth not affect the arterial blood, the Buttery of whole Nature.

And moreover, Let them prove, that the good blood being diminished, and the strength proportionally, that there is a greater power in the impure blood that is left, and which is defiled by corruption (as they suppose) of preserving it self from putrefaction hanging over its head.

Let them likewise teach, contrary to the sacred Text: *that the Life and Soul are rather, and more willingly in the remaining defiled blood, than in the more pure blood which was taken away by the cutting of a vein.* Otherwise regularly the drawing out of good blood includes an increased proportion, and unbridled liberty of the bad blood remaining.

What if at length in a Fever, and in the veines there be bad blood, and they say it is good (as a sign, or effect) which in the letting out of blood flowes forth as evil; and they think that so much bad blood at least, is taken away: First let them prove the blood which they account hurtfull to be truly hurtfull, even as I have already before proved it to be harmlesse.

And then, let them teach, that by such an hasty and full emission of bad blood, nothing that is of prejudice is taken from the strength; and that the remaining blood being defiled, and the Faculties being now diminished, the emptying out of blood that is made, shall be for a cause, why a putrifying of the remaining blood is the less able to proceed; and whether they hope that blood being at sometime, after what manner soever once putrified in the veines, there is afforded in Nature, a going back or return: To wit, from such a privation? For let them shew that it is not a contradiction, that it is proper to a Fever to defile the blood it self, and for this property to be taken away by the effect, to wit, by a removal of that which is putrified? For if the more impure blood be at first drawn out of the vein, and they repeatedly open a vein, in the mean time they prostrate and disturb the Faculties: hence also they take away the hope of a Crisis: what if then the more red blood shall flow forth? Surely they cry out as if the whole Troop of the Maledy were taken away at the first turn, and as if the Seat of Fevers had been extended only from the Heart unto the Elbow; but that the good blood resided about the Liver. But I have alwayes discerned evacuations of the last excrements to be fearfull in the Drop sic; and therefore, much more in a naked snatching away of the blood, which withdrawes in a direct passage, the vital spirits from the Heart through the Wound, whether that blood be accounted bad, or good, or neutral.

First of all, I have proved, that as well those things offend in begging of the principle, which are supposed concerning a putrified continual, and burning Fever, as those which are supposed concerning the emissions of putrified blood. Wherefore, in speaking according to Numbers, I have alwayes found Succours that are made for the snatching away of the strength, to be full of deceit, as that for a very little ease, the Faculties the Porters of Diseases, are weakened: For even so as drink at the beginning of Fevers seemeth to comfort Thirst for a little space: but who is so mad that he would then drink, if he knew that the drink would flie away his necessary powers? Therefore the ayd of cooling by cutting of a vein, is unfaithfull, deceitfull, and momentary.

At length, concerning neutral blood, which in respect of cutting of a vein, is neither good, nor evil, it is not worth ones labour to speak any thing: seeing that which is denyed under a disjoyning, may also be denyed copulatively. For whether that be neutral blood which consisteth of a co-mixture of the good with that which is depraved (by supposing that to be depraved which is not) or that wherein a neutral alteration is introduced, for both events, the particulars aforesaid do satisfie.

Lastly, That I may cut off the hope that is in Revulsion, and so equally take away all co-indications, as the wretched privy shifts of obstinacy. It is a mad ayd to have cut a vein (for this end, they for the most part require a plenteous one) whether in Fevers, or next in the Menstrues for Revulsion: because a Feverish matter

- swims not in the blood, or floats in the veins as a Fish doth in the water : but it adheres or sticks fast within, to the vessel, even as in its own place, concerning the occasionall matter, I will declare : But for the *Menstrues* in like manner, because a separation thereof is made from the whole, and that, not but by a separating hand of the *Archeus*. But *Bloud-letting* separates nothing of the separable things : because it acts without a foreknowledge of the end, and so without choyce : But presently after the vessel is opened, the more nigh and harmless blood alway flowes forth : the which, because other afterwards follows by a continual thred for fear of a vacuum : therefore the *Menstrues* otherwise by the endeavour of Nature collected about the Womb, are by cutting of a vein drawn away from thence ; and go back into the whole Body. But if *Phlebotomy* shall sometimes well succeed in a Woman that is plethorick, and full of joyce ; yet surely in many others it hath given a miserable overthrow. For if the *Menstrues* should offend onely in its quantity (while as it is now collected, and separated in the veins about the Womb) I shall willingly admit of an individual betokening of *Phlebotomy*, and onely in the Case supposed. But the *Menstrues*, if it shall flow in a well-constituted Womb, it abundantly satisfies its own ends, and in this respect Revulsion is in vain, although the Supposition supposeth it to be even an impossible thing. For *Bloud-letting* is nothing but a meen, and undistinct emptying out of the blood : But the veins being emptyed, they out of hand recall unto themselves any kind of blood whatsoever from on every side : Because as they are the greedy sheaths of blood, so also are they impatient of Vacuity or emptiness : And therefore the veins that are emptyed do allure the *Menstrues* designed for utterance ; That is, being in this respect once enrouled by Nature in the Catalogue of Excrements,
- 40 But Derivation, because it is a sparing effusion of blood, so it be made out of veines convenient, it hath often profited in many locall Diseases, and so in Fevers it is impertinent.
- 41 But they urge, that the cutting of a vein is so necessary in a Pleurisie, that it is enjoyned under a Capital punishment. For truly they say, that *unlesse the blood flowing together into the Ribs, be pulled back by the effusion of much blood, there is danger least the Pleurisie do soon kill the man by choaking of him.* Surely, I let out the blood of no person that hath a Pleurisie, and such a cure is safe, certain, profitable, and sound : None of them perissheth : whereas in the mean time, under *Phlebotomy* many do at length perish with a long or lingering Consumption, and experience a Relapse every Year : For according to *Galen* : *Whosoever they be that are not perfectly cured on the fortieth day, become Consumptions* : But I perfectly cure them within few dayes : neither do they feel a Relapse. Neither indeed have I alone my secrets for this purpose :
- 42 But moreover, I have seen a Country man curing all Pleuritical persons at the third draught. For he used the dung of an Horse for a man, and of a Nag for a woman, which he dissolved in Ale, and gave the expressed straying to drink. Such indeed is the ignorance of *Physicians*, and so great the obstinacy of the *Schools*, That *God gives knowledge to Rusticks, and Little ones, which he denyes to those that are blown up with Heathenish Learning.*
- 43 We must now see, if there be any use of Revulsion in Fevers. For indeed, since the work of Revulsion is not primarily any other thing than the cutting of a vein, whereunto the succeeding blood is by accident hoped to come, and that by the benefit of that thing, it should not flow unto the place affected : Upon this Position it follows : That by such an Evacuation, the offensive Feverish blood (so I connivingly speak) shall be drawn as dispersed into the veines, which otherwise lurking in its own Nest far from the Heart, could not so cruelly communicate the Ferment of its own hurt unto the Heart : which is to say, that it should be drawn from a more ignoble part, unto a more noble one. For the more crude, and dreggish blood is in the *Meseraick veins* : but the more refined blood is that which hath the more nearly approached unto the Court of the Heart. For otherwise, Nature as undiscereet, had placed the chief Weapons of *Parricide* nigh the Fountain of Life. Seeing therefore the matter of a Fever, floats not in the veins, nor sits nigh the Heart : Far be it to believe, that that is fetch'd out, or moved from its place by the cuttings of a vein ; however, divers coloured blood be sometimes wiped out by the repeated emissions of blood. It is therefore a cruel Remedy, if unto the place of the blood let forth, other blood shall come from remote parts : For so the contagion of one place should be dispersed into the whole body, and unto the more noble parts ; and otherwise there is an easie co-defilement in things or parts that have a co-resemblance.
- 44 Lastly, if the Errors of the Heathens being once renounced, Modern *Physicians* would have respect unto the Life of their Neighbour, verily they should know that the devices of

of Revulsion are vain, that it is a pernicious wasting of the Treasure of blood and strength; that no hurt doth insule from the blood within the veins, but onely from hostile, and foreign excrements: that God also hath made sufficient Emunctories or avoyding places of any filths whatsoever, neither that there is need of a renting of the veins for a victory over Fevers.

CHAP. V.

Purging is Examined.

1. The first confession of the Schooles concerning their purging Medicines.
2. The de-
ceits of Corrections.
3. Another confession.
4. A third.
5. Shamefull excuses.
6. A fourth confession.
7. A frequent History.
8. Deceit in the name.
9. It
is explained, what it is for a laxative medicine to be given, while the humours
do swell or are disturbed, and how full of deceit it is.
10. A History of the re-
pentance of the Author.
11. A conclusion drawn from thence.
12. Nine re-
markable things for the destruction of the Schooles.
13. A History of a certain
chief man.
14. A fifth confession.
15. An examination of the aforesaid parti-
culars.
16. A sixth confession.
17. Vain and foul privy shifts.
18. weapons
retorted from a seventh confession.
19. An argument of poyson from stink.
20. A mechanical proof.
21. The same out of Galen.
22. A proof from the
effect.
23. The Schooles oppose their own Theoremes.
24. The suppositions of
the Schooles being granted, none could dye of a Fever, and it should be false,
that purging things are not to be given in the beginning of Fevers.
25. That
this Aphorisme includes a deceit, and an unadvisednesse of Hippocrates.
26. Cotion in Diseases is the abuse of a Name.

THE Schooles acknowledge that their Purgers, even unto *Agarick*, have need of Cor-
rection, because they enforce Nature. And I wish those Corrections were not slug-
gish, nor blockish, and that they did rather serve for obtaining the innocency of a Me-
dicine, than for a gelding thereof. For truly, a gelding of the Faculties in a Medicine in-
cludes a deceit: To wit, least the sick should understand that a poyson sublieth therein.
For the Tamed Remedies of the shops are like an Household Wolf; who when an occa-
sion is given him, while he is trusted in, returns unto the wonted cruelty of his own Na-
ture. For from hence, neither dare they to call their corrected purging Medicines by
their proper *Etymologie*; To wit, They vail *Scammony* with the name of *Diagridium*;
as also they mask *Coliquintida* with the name of *Alhandal*.

In the next place, Laxative Compounds in *Dispensatories*, war under the dissembled Title
of a Captain or Leader.

In the mean time, They cannot deny, but that in every solutive, *Scammony* and *Colo-
quintida* are the two pillars, whereby the whole Edifice of Purging is supported: and
the which being dashed in pieces, all of whatsoever was superstructed thereon falls to the
ground.

Next, The more mild Solutives: as *Manna*, *Cassia*, *Senna*, *Rhubarb*, &c. have given
up their names unto those two Standard-defending Leaders.

The Schooles confess, I say, That a laxative Medicine being administred, it is no longer in
the power of the Physitian: and so, they hereby defame their Laxatives, and therefore put
them behind *Phlebotomy*. For if a laxative Medicine shall commit any the more cruel
thing, They accuse either the Dose, or the Correction, or the fluid nature of the sick, or
the Apothecary, or his Wife, least otherwise the name should perish from a Solutive Me-
dicine.

- 6 Yet in the mean time, will they, nill they, they confesse, that all Solutives do enclose in them a consuming poyson: and they in the Proverb, call Aloes alone, harmlesse. But the others are to be administred with an additament, Correction, and Circumspection, as neither rashly, nor fore-timely.
- 7 For of late, a judicious man of the privy Council of *Brabant*, that he might preserve his health, had taken a usual Pill of washed Aloes (To wit, gelded or Corrected) wherof, while he found not the effect: he declares it to a *Physitian* passing by, who blames the sluggishnesse of the Aloes, and so turns [*picron*] or bitter, into [*pigrum*] or slow. I will prescribe, saith he, corrected pills of greater vertue: The which being taken, he miserably perished; because it was in vain endeavoured by him for a whole week, that he might restrain the unbridled effect of the Laxative Remedy: For he, that he might free himself from a future Disease, perished by the deceit of the *Physitian*, and left eleven Children, From whence it is first manifest, That it is as well free for a loosening Medicine to Tyrannize on him that is in good health, as otherwise on a sick person: To wit, it is lawfull under the name of a *Physitian*, and deceit of a purging Medicine, to prey even upon the life of Princes without punishment; Because the earth covers the cruel ignorance of *Physicians*..
- 8 A Purgation or purifying is indeed a Specious Title, but full of deceit. And I wish that the purgatory of the *Physitian* were able to expiate Diseases! I wish in as much as this is not done, that the sick would not expect a purgatory Medicine from the Hand of *Physicians*!
- 9 Surely it is a thing most worthy of lamentation, what they say, That a Laxative Medicine being administred before the Coction of a Disease, the same humours indeed are drawn forth (for they will have loosening things to draw out one humour, and not another, by Selection or Choyce) which otherwise, after the aforesaid Concoction of the Disease, is notwithstanding unprofitable, yea and hurtfull. Neither yet do they from thence hitherto learn, That the humours brought forth by Laxative things, are not Humours, nor offensive ones; (for otherwise at both stations of the Disease, and from the things supposed by one onely Laxative, they ought of necessity equally to profit, if they detract from the same offensive matter) but a meer putrefaction, and a meer Liquor corruptively dissolved through the poyson of the Laxatives: And by so much the more unhappily is this Enemy drunk in, that it may exercise this brutish Butchery within, in the flesh, and blood.
- 10 For by an History of the Fact, I will declare the Beginnings of my own Repentance and Knowledge in Healing. For indeed, I was scarce past my striplings, but that I had took hold of the Glove of a Gentlewoman infected with a dry Scab: From whence, I contracted a Scab, first on that Hand, and afterwards on the other Hand, being infamous with corrupt pus, and wheals. The Seniour *Physitians* of our City being called unto me: They first commanded the cutting of a vein for the cooling of the Liver: And then, they prepared an *Apozeme* of three dayes continuance, for the bringing of yellow torride Choler, and salt phlegm out of the Body. And at length they began the purging of the aforesaid Humours by the Pills of *Fumitory*, and provoked many stools abundantly. I was glad, because I had voyded an heap of stinking Liquor: They therefore admonished, that the same Medicine was to be taken next day after the morrow; and likewise again, after three dayes, with the like success: and in my judgement, if the putrified, and stinking matter had all been joyned together, it had easily filled two buckets; which I thought to be Humours: For I who before was healthy, chearfull, of entire strength, light in leaping, and running, was now reduced into leanness, my Knees trembled, my Cheeks were slid together, and my voyce was hoarse. I said therefore, and too late, in what place were those Humours entertained in me? For neither did I find Room for so great a Hotch-potch mixture in my Head, Breast, or in my Belly: For although I had been deprived of all my Bowels, yet the whole hollowness could scarce have contained the half part thereof: Therefore I concluded with my self, that those Humours had not fore-existed in me, but were made in me. And I clearly knew, that that putrified Liquor was made by the received Laxative Medicine; That the same thing was to be done as oft as I should take it: in the mean time the same scabbedness assailed me as before.
- 11 Whence 1. I knew, That scabbedness is a contagion of the skin, but not a distemper of the Liver.
2. That the vice of those Humours in the Scab, was feigned: The which was gotten onely by a co-touching of the Glove.
3. That

3. That purging Medicines did not purge or cleanse, but putrifie.
4. That they had melted the lively substance of my Body, and had resolved it into putrefaction.
5. That they did indifferently defile whatsoever they did any way touch at, whether it were blood, or next, the lively flesh it self : but that they did not selectively draw out, and separate one thing instead of another.
6. That the matter defiled did denote its Defiler to be a meer liquefactive or melting, and putrifying poyson of the Body.
7. That the defiled matter flowed forth, Nature expelling it, untill that the force of the purging Medicine was spent.
8. That this was done no otherwise in an healthy, than as in a sick person.
9. And that therefore a Solutive Medicine was dangerous, before that Nature was the Conqueresse in Diseases: but afterwards, that the hurt thereof did not so manifestly appear.

Which things I having long, and seriously weighed with my self, I desisted from *Galen*, who was wholly so incumbred about those Humours, that he affirms all Diseases to consist thereof. But seeing better things were as yet wanting unto me, which I might substitute in the room of Humours, and Laxatives; I was willing with an admiration, and compassion of mankind, at length to suspend the study of Healing, untill the most High of his own good pleasure, after much expence of Monyes, and Yeares, vouchsafed to grant understanding unto me that sought it; The which, I wish the World might by my works apply unto it self for profit. Boldnesse increased in me in proceeding, and I was daily the more confirmed by the daily observations of the Errours of *Physitians*.

Among other things, I remember, that chief *Physitians* had administered to a Prince, a purging Medicine with *Scammony*, whence in one onely day, forty and one stools had succeeded: The which, being by my Command weighed together with the urine of that day, weighed eighteen pounds, and seven ounces of yellow and putrified Liquor, I therefore said unto him, and to his *Physitians*: Truly, if that Liquor be yellow Choler, and one of the four Humours, now the phlegm remaining from thence in the Body (it according to *Galen* exceeding Choler, in one third part) shall weigh twenty and seven pound, and ten ounces, and by the same account nine pound and three ounces of meer black Choler remained: That is, thirty six pound, and thirteen ounces of phlegm, and melancholly, unmixt with yellow Choler.

Therefore they ought to confesse, That a Purgation is not a purifying of the Body, but rather a distempering of the Humours left behind, if there were any such.

And then, that the aforesaid loosening was not an Elective cleansing out of yellow Choler, or a freeing of the Body from superfluous Choler; but a meer putrefactive melting of the Blood. For truly the Blood did not stink before, while it was in the veines, it presently stinketh in the Bowel at the same instant wherein it falls out of the veines.

But I pray, In what vessell shall thirty seven pounds or pints of remaining phlegm, and black Choler be now contained? Especially while as after the purging, the veins which were before swollen, have now fallen down, and no longer appear? For on the morning following, that miserable man who committed himself to your judgments or wills, and supposed that he was purified, speaks with a feeble, sharp, and hoarse voyce, he trembles with his Hands, and staggers with his Knees, his eyes being hollow, his veines exhausted, his Countenance being dejected, and being pressed with an importunate Thirst, and a dejected appetite, affirms that he suffered many things the day before, through so deceitfull and vexatious an experience of purifying, and doubteth that he shall again return the same way. Yet he certainly believeth, if the Dose of the Laxative Medicine had been more encreased, the buisnesse had succeeded ill with him. For from that strong Purgation in the Prince, the poysonous property of Solutive Medicines ought presently clearly to appear.

The *Physitians* answered, That the ready nature of the Prince had too much hearkened to the purging Medicine, and for eschewing of the aforesaid filth of the humours that were left, and also for the disproportion of the same: which Choler that that *Scammony*, not onely by its property draws forth: but that of the blood it self, or of a composition of the four Humours, it made one onely Liquor, being rejected by stool.

Whence I again concluded, that it was an Imposture, and Deceit, which supposed

eth Choler, or phlegm to be drawn out, and the which avoucheth one Humour to be selectively avoyded before another, while as now they confesse, *that all of them are melted together.*

And according to *Galen*, when the Bloud putrifies, yellow Choler is made : and that it is false, that a Cholagogal or Extracter of Choler (for examples sake) cures Cholerick Diseases, and that it is a deceit in those who say, *Choler is drawn out, if the other three also being first corrupted, are ejected together with it.*

Certainly there is none studious of the Truth, who may not from hence presently understand, That the Foundation of Healing of the Antients goes to ruine, as well in respect of Humours, as of the Selection of solutive Medicines. Truly I admire even to amazement, That the World hath not yet taken notice of the destructive danger of Laxative things : The which otherwise, so suddenly well perceives any wiles or subtle crafts extended over their purse. For truly, it is not to be doubted, but that Laxative Medicines do carry a hidden poyson in them, which hath made so many thousands of Widowes, and Orphans. For neither do they draw forth a singular Humour after them : The which I have demonstrated in a singular *Treatise*, never to have been in Nature, except in the Books of *Physicians*. For increase thou the Dose of a Laxative Remedy, and a deadly poyson will bewray it self.

19 Come on then, Why doth that your Choler following with so swift an efflux, stink so horribly, which but for one quarter of an hour before did not stink? For the speedinesse of flowing forth takes away the occasion of putrefaction, as also of stink : For it smells of a dead Carcase, and not of Dung. Neither also should it so suddenly borrow such a smell of stinking dung from the Intestines. Therefore the stink shewes an efficient poyson, and a mortified matter drawn out of the live Body : The which I prove by way of Handicraft-Operation.

20 If any one shall drink a dram of white *Vitriol* dissolved in Wine, it presently provokes Vomit : But if presently after drinking it, he shall drink thereupon a draught of Ale or Beer, Water, &c. he indeed shall suffer many stools, yet wholly without stink. *Scammony* therefore, and *Vitriol* do alike dissolve the bloud of the *Meseraick* veines: This indeed by its violent brackishnesse ; But that by the putrefactive, and strong smelling poyson of Laxatives. From the consideration whereof alone, purging ought to be suspected by every one as a cruell, and stupide Invention.

21 For if according to *Galen* ; the bloud when it putrifies, is made yellow Choler : therefore the stinking and yellow Liquor that is cast out by Laxative Medicines, and which dissembles Choler, is generated of putrefied bloud: And by consequence, that Laxative Medicines themselves are the putrefactives of the Bloud: The which is easily collected out of *Galen*, against the will of the *Schools*. For he chiefly commends *Triacle*, because it most especially resisteth poysons.

He also affirms also a discernable sign of the best *Triacle* to be, that if together with Laxative Medicines, *Triacle* be taken, undoubtedly stools shall not follow.

22 Do not these words of *Galen* convince, that Laxatives are meer poysons? To wit, all the operation whereof is evaded by *Triacle*, the Tamer of poysons? unto which suspicion the effects do agree : Because a Purging Medicine being taken, the sick, and healthy do equally cast forth Liquors of the same colour, odour, and condition : Wherefore, it requires not a offending Humour, before an unoffensive one ; but it indifferently defiles whatsoever it toucheth upon.

23 Moreover, the *Schools* also oppose the selective Liberty which they attribute unto solutive Medicines : For if any humour of the four be putrified in Fevers, and naturally betokeneth a removall of it self : But if Laxatives do selectively draw out a humour from the Bloud, yea in healthy persons (as they will have it) do cause found flesh to melt, that they may thereby obtain their scope, which is to pour forth a putrified or stinking Liquor, which the paunch casts out. At leastwise, Laxatives shall not have the like Liberty in Fevers, for drawing forth of the offending, and putrified excrement: For that which is corrupted, hath no longer the former essence, and properties which it had before its putrefaction. For if the *Loadstone* attracteth Iron, it shall not therefore draw rust unto it : And therefore if a purging Medicine resolves the flesh, and bloud, that it may thereby extract Choler which it drawes bound unto it self by a specifical property ; it doth not therefore likewise draw stinking, and putrified excrements included in the veines, which should be

be the cause of Fevers. Surely none should ever dye by Fevers, if the two Maxims²⁴ of the *Schools* were supported with Truth; To wit, if *purified humours are the cause of Fevers*. And likewise, if they depart selectively, through purging things. Besides, it should be a mad Caution, That purging Medicines be not given in the beginning of Fevers, before the matter be troubled or rise high; To wit, before the maturity, and Coction of the peccant matter: From whence it is sufficiently manifest, that loosening things should otherwise be hurtfull. But if they are given after that the matter of the Disease be now well subdued, the aforesaid Caution contains a Decit: Be-²⁵ cause it attributes the effect procured voluntarily, and by the benefit of Nature unto the loosening Medicine.

From which surely, an honest *Physician* doth then also more justly abstain: Because it then disturbs the Crisis, induceth the danger of confusion, and of a Relapse. For a loosening Medicine doth alwayes, and by it self draw out things not cocted, no otherwise than those which are afterwards called cocted ones: because it is on both sides alike cruel, and poysonome. But after that Nature hath overcome the Disease it brings on lesse damage, neither is the deceit of a Laxative Medicine then so apparently manifest: And so, if then a loosening Medicine be given, the *Physician* shall seem to have conquered the Disease by his own Art. But besides, if all particular Laxatives should extract their own Humours by a Choyce, they should of necessity also, be of concernment at every station of the Disease, because they are those which alwayes draw out the same Liquor, and that alike stinking: but they disturb as much as may be, as long as Nature shall not become the Superi-²⁶ our: Which victory of that Disease, the *Schools* have called *Concoction*: Not indeed that Nature attempts to digest or Coct any thing which is vicious, or which falls not out for her own use or profit: because she is that which is governed by an unerring Intelligence.

Let these Admonitions suffice concerning both the Universal Succours in Fevers. I concluding with *Hippocrates* unto *Democritus*; That every Solutive Medicine, robs us of the strength, and substance of our Body.

CHAP.

CHAP. VI.

The Consideration of a Quartane Ague.

1. A Quartane hath deluded the Rules of the Schooles. 2. Why they know not how to cure a Quartane. 3. That the wonted excuses in other events of Diseases do fail. 4. A presage from a Quartane, in other Fevers. 5. The examination of a Quartane according to the account of the Schooles. 6. The weaknesses of Galen himself. 7. Failings noted in Physicians. 8. Constrained words in the confession of Physicians. 9. An argument against black Choler in the Spleen, and the privy shifts of Physicians. 10. The true reason whence the Spleen waxeth hard about the end of a Quartane Ague, and the error of the Schooles is discovered. 11. Some remarkable things in a Quartane. 12. The manner of be-drunkenning, and the Organs thereof. 13. A notable thing concerning a Vegetable Spirit of Wine out of Juniper-berries. 14. Why Wines are ordinarily gratefull to Mortals. 15. After what manner the Arteries draw their Remedies. 16. An impediment in abstracted Oyles, which is not in the Salts of the same. 17. The manner of making of the Cardiack or Heart-passion, which they also call the Royal Passion. 18. Divers Chronical Diseases are from the Stomach. 19. The ignorance, and sincerity of the age of Hippocrates. 20. There is no Seat for a Quartane left in the Schooles. 21. A few remarkable things concerning Madneses, are declared. 22. The Seat of foolish Madneses.

Surely I have demonstrated in an entire Treatise, that there never were Humours in Nature, which the Schooles of Medicine presuppose for the Foundation of their Art; and that Treatise should professedly have respect hitherto, unless it had been ere-long to be repeated in a work of other Diseases: Because they have every where named all Diseases by those Humours.

But it shall be sufficient in this place, to have demonstrated by the way, That Fevers do in no wise owe their original unto those Humours, whether they are entire, or putrified ones.

Now I will speak something concerning a Quartane Ague: but not that it differs from its Cousin-German Fevers in its matter, and efficient cause, or is cured otherwise than after one and the same manner, and by the same means, whereby other Fevers are overcome: but because a Quartane hath never been vanquished by the broken forces of the Schooles: and so it hath made mocks at the Commentaries of Physicians and their vain Speeches concerning black Choler, concerning the Spleen as the sink of black, and burnt Choler, and of loosening Medicines bringing forth black Choler by a Choyce.

A Quartane Ague therefore, hath long since exposed the Doctrine of the Universities, and the promises of these unto Laughter, as being vain Trifles and wan Fables without strength: For truly a desperate curing by Arts, hath made manifest the feeble help of Medicines, the vain promises of Dispensatories, and the undoubted ignorance of the causes of Fevers. Good God! it is now manifest, that Physicians cannot onely not cure the Leprosie, Gout, Palsie, Asthma, Stone, Falling-sickness, and other Diseases contained under the large Catalogue of incurable ones, which are never cured of their own accord: but they have not known how to take away so much as a Quartane Ague, which patiently expects, and deludes every endeavour of Physicians: The which notwithstanding Nature cures by her own power, to the disgrace of the Schooles! For they who attempt their Cures onely by the cuttings of a vein, Sarrifings, Leeches, Vesicatories, and purgings

purgings of the Belly; and so by diminishments of the Body, and Strength, and stick wholly in Heathenish Doctrines, are even excluded by Nature from the true knowledge of Causes, and Remedies.

Because first of all, None of their Medicines reacheth unto the Seat of a *Quartane*, but it first paying Tribute through the Toles or Customes of every Digestion, is stript of every Faculty requisite unto so great a malady. For neither ought I to draw out that thing from elsewhere, or to prove it by many Arguments: Be it sufficient, That the Succours of *Physicians* have been hitherto unprosperous: For they purge and cut a vein, and then they leave the rest to be boren by Nature; And in the mean time, they certainly know that they shall profit nothing by Remedies of that sort, nor that they ever have profited thereby: I wish at least, that they had not done hurt. They ought therefore to confess, that Remedies, and also all the suppositions of Art faileth them in this Disease; Yea, neither that the wonted privy evasion of incurableness in other Diseases is of value unto them: For all the powers of the *Universities* being conjoyned, cannot perform so much as Nature can, and doth do without them of her own free accord.

But moreover, The same shamefulnesse of ignorance, and every way impotency which a *Quartane* hath discovered in the *Schools*, They should be compelled to confesse in the other curings of *Fevers* also; if those did not hasten to an end of their own accord. Wherefore I now conjecture, That the out-law a *Quartane*, in the Age that is forthwith to come, shall distinguish false *Physicians* from true ones, whom the *Almighty* hath Chosen, Created, and Commanded to be Honoured.

The *Schools* therefore define a *Quartane* according to the account of other Fevers, by a heat kindled besides nature, first in the heart from the humour of black Choler being putrified, and diffused by the utmost small branches of the veins into the habit of the body: The seat of which putrified Choler, they nevertheless acknowledge to be in the Spleen.

I importunately crave at your hands, I beseech you let the profession of Medicine tell me, what harmony they can ever utter from so great dumnesse? And whether it be not to have blinded the minds as well of the sick, as of young beginners with prattle? Let them explain, why that heat is not first kindled in the Spleen, where the cause, or humour *siteth*, which by its putrefaction (as they say) is the cause of an unnatural heat? even as while a Thorn being thrust into the finger, sticking fast therein, the finger it self first rageth with heat, and that long before the putrefaction of inflammation? Why is a *Quartane* so stubborn, if at every fit nature opens a passage for it self, whereby it may disperse the putrified black Choler thorow the veins into the habit of the body, even in the very rigour of cold, and straightnesse of the veins? After what manner shall the same black Choler in number be as yet putrified after a year and an halfe space, and afford an hard Spleen, if at every fit it be dispersed into the habit of the body? How, if it was from the beginning in the Spleen, with so daily a fornication of putrified matter, hath it not long since putrified the Spleen? The which (especially) is accounted by the *Schools* to be nothing but a sink of the worst excrement? After what manner doth a *Quartane* after so many moneths retire as better, of its own accord, to the disgrace of *Physicians*, while as notwithstanding, it shall of necessity be more dry, gross, and shall more putrifie than at its first fits?

Again, What humour which from its rise is evil and putrified, can be at length digested? Doth nature become foolish, that she at length, after a divorce, and a year and a halfe time begins to digest the humour which in the beginning she had refused to digest, it being already before of necessity plainly putrified? What reason is there of the change of her will? Hath it then first repented Nature of her deed? How shall she not weary her self, which hath almost worn her self out in striving so many months with a putrified, and the worst of Humours, That she might exclude that which hath now hardened in her possession, and which was offensive in so many respects? For if in three days space, as much of black choler be kept as is sufficient for a fit, what is this to the Spleen? or what shall it make to the digestion of the primitive, and putrified black Choler? If black choler be daily of necessity made anew, be laid up into the spleen, and from thence be brought into the stomach its emunctory? How shall nature so many months be forgetful of the passages, expulsions, and rites of that Emunctory? and shall not be mindful of these, but nigh the end, which is so tiresome? What if *Senna*, *Epithymum*, and the *Arsenick*, which is entertained in the bones of *Armenia*, and *Lazulus*, do fetch out black Choler on every side (especially out of its natural Inn) and this be the total, un-

H h h h h 2

doubted

doubted cause of a Quartane, and accused by so many Rules, Authors, and consent of ages: Why therefore do they not take away, diminish, or any way shorten a Quartane?

But Physicians after so many torments, forsake their sick, being weakened under the custody of despair, and commended to the government of the Kitchin. At length, what will that much and stinking balast of liquor avail them, which these Medicines being drunk, the credulous sick person casts forth without profit, and perceives his strength to be diminished hereby?

Is not that saying of Hippocrates true? *If those things which are convenient are drawn out, the sick feel themselves the better, and easily bear such purgings of the belly.* For why although such solutive medicines are immoderately taken even unto the last breath of life, yet doth the Quartane Ague slacken nothing of its power?

Learn ye therefore ye younger Physicians, of me an old man, That your Humours, and laxative Medicines are nothing but meer delusive doatages, whereby in subscribing to each other, ye have been deluded by Heathens, unto whom the gift of healing was not given: Because Galen never saw so much as Anatomy, however magnificently he triumphs concerning it, and of the use of parts; He never saw *Argent-vive* or Quick-silver, and all Simples he borrowed word for word out of *Diascorides*, the name of this man being suppressed: He never I say, knew even Rose-water.

Is it not a shame that ye should wipe away some moneys, that ye hand forth the cuttings of a vein, and now and then the more gentle purgers without hope of amendment? And ye *mutter* many things among your selves even to a loathing, concerning the digestion of black Choler, concerning the little cloud or that which swimmeth in the urine, when as notwithstanding, ye being full of distrust, must confess That these words lay hid in your breast from the beginning:

“Against a Quartane Ague we have nothing, we let out blood, and purge, and afterwards know nothing: The sick party must expect the term or end thereof with patience: “Because against a Quartane there is no remedy in our Cabinets: Nature ought to help her self.

In the mean time, the Spleen swells harder, and oft-times the Ancles also together with it: If therefore black Choler should be the containing cause of a Quartane, and should afford an hard Spleen, how at length doth the Ague cease, the total cause thereof remaining in the Spleen? After what manner it being now hardened in the Spleen, shall it be better evacuated, than while nature attempted the banishment thereof by the Fever. At length, after what sort shall it better depart, being hardened, than being fluide in the beginning? Hath it, the Ague ceasing, lost its putrefaction? To wit, while it threatens a Dropsie, and the Spleen being harder, swelleth? The which notwithstanding are tokens of its former naughtiness. But whether black Choler alone among natural things shall return from the putrefaction of it self into its former state? But if the Ague ceaseth, because the black Choler was consumed by so many Circuits, Why now doth it more obey the Physician than while there was no extension of the bowel? Why now at length do you hope for aids from *Capers*, *Tamarisk*, and *Ammoniacum*, the which while the Ague remained were sluggish? If the same black Choler surviveth, why doth that cease, the Fever being safe? But if the black Choler hath departed with the Fever, why do ye prescribe remedies for the more fluide black Choler? But if ye feign black Choler to be brought unto the Spleen by an Imposthume, what is that bowel more noble than the Spleen, which without sense or feeling, Complaint, and contagion hath so long endured black Choler besides nature? And which had suffered so many fits of Fevers? Why was not that imposthume made while the faculties were as yet entire, they being the more fit for expelling of the enemy? Why not, while the matter was the more fluide?

How wil ye salve this, That the Spleen is the Emunctory of black Choler, if it hath behooved this Choler to be at length brought to the Spleen from elsewhere, after so many labours and anguishes? Why therefore have the hardness, and swelling of the Spleen at length increased unto a proportion, with labours? Surely it is a wonder that it hath hitherto been unknown, that the Spleen under the tortures of a Quartane hath suffered many things, from all the particular digestions whereof, that ballast is left for the swelling of the Spleen, without the error of local humours: And that therefore the hardness of the Spleen is from those erroneous transchanged superfluities, and therefore the greater, by how much the foregoing affliction of the Spleen was the more grievous; To wit; That the Spleen swells from what was produced by the Quartane, but that it is not the very occasional

occasional matter of the Quartane and much less, any black Choler, because it is that which was never in nature; Wherefore also it happens, that such a hardness vanisheth from the Spleen of its own accord, after that the *strength* being retaken, nature perfects her own digestions; Wherefore the cure of a hard Spleen is not seated so much in the moistening, softening, and purging of black Choler, as in refreshing of the faculties of Digestion.

For the Confirmation whereof, we must know, That the Spleen is bespangled with perhaps four hundred arteries; neither that any bowel at all is enriched with so frequent a propagation of Arteries as the Spleen is: And then we must know, That the *Seat* of a Quartane is not only in the very body of the Spleen, but in the very Arteries thereof themselves; if not in them all, at least in some of them: Which one only point, hath made the cure of a Quartane difficult.

Thirdly, at length we must know, That an Artery draws no juyce to it self out of the stomach, intestines, or from elsewhere: For to what end should it draw that juyce unto it self, since it shall not produce any good to it self thereby? For that Chyle or juyce being attracted, doth as yet want foregoing means whereby it can ever be brought unto the perfection of arterial blood: Otherwise, the Arteries had drawn unto themselves more vexation but by a little sucking of a foreign liquor, than they are able to wear out by long pains for the future.

I grant indeed, that the Arteries do ordinarily, and immediately attract a be-drunkening spirit of the stomach, which is bred almost in every vegetable, which is disoblighed from the composed body through art, only by vertue of a ferment, and at length is drawn out by the fire.

For example, If the berries of *Juniper* are boyled in water under an Alembick, an essential oyl, and water do presently after rise up, and are collected: At length if those berries are then in the next place, steeped by a ferment, the distillation being afterwards repeated, a water most gently burning, or an *Aqua vite* is extracted; yet less, than if from the same berries an oyl were not first withdrawn. Thirdly, at last, if the remaining berries being strained thorow a sarse, are boyled into an Electuary, thou hast now obtained a solutive Medicine, excelling all the compositions of the shops. An Artery therefore willingly snatcheth to it self the burning spirit of life, a guest of the vegetable nature, out of the stomach (which the Grecism of the Schools never saw, or knew) the which otherwise nature by her first instruction prepares out of the digested Chyle: surely she rejoiceth, that she hath found a liquor with much brevity, from whence she may make vital spirit for her self.

For in this respect Wines are regularly pleasing to Mortals, they exhilarate the heart, and do make drunk, if they are drunk down in more than a just quantity: For the spirit of Wine is not yet our vital spirit, because it is as yet wanting of an individual limitation, that the vital inflowing *Archus*, the Executer of our functions may from thence be framed: Wherefore since neither the Mesentery, nor Liver are ordained for the framing of vital spirit, the heart rejoiceth immediately and readily to suck to it that spirit (being already before prepared) through the arteries, out of the stomach.

Whence it follows, If the arteries attract unto themselves the Spirit of Wine like unto vapours, they shall also draw the odours of Essences: For from hence are faintings, yea and on the other hand, restorations: But the arteries draw not Oils, although essential, and grateful onds, because they suck not the substance of liquor, and much less oils: Therefore that a Medicine may be received by the heart, and by this heart attracted inwards, it ought to be that which yields a good smell, and to be unseparably married to the spirit of wine.

Wherefore Wines that are odoriferous, do more readily bedrunken than others, because the odours which are married to the spirit of wine are most easily admitted unto the heart, head, womb, &c.

But oylie odours being abstracted from their Concrete bodies, do rather affect by defiling, than materially enter into the Arteries: For therefore through the immoderateness of Wine, and the errors of life, not only a meer spirit of Wine is allured into the arteries, but also something of juyces together with it:

Whence at length difficult heart-beatings grow up in the gluttons of Wine, and the meer or pure spirit of Wine by an importunate daily continuance, strikes the reed of the artery within, disturbs the local and proper digestions thereof; wherefore also a part of the arterial nourishment degenerating, stirs up divers miseries, even durable for life.

18 For it happens in the Artery of the stomach, that the spirit of wine joyning it self by its own importunity to the spermatick nourishment of the artery, in the course of dayes stirs up unobliterable *Vertigo's* or giddinesses of the head, continual head-aches, the Falling-sickness, I say swoonings, Drowfie Evils, Apoplexies, &c. For in the family-administration of this member, as it were that of the heart, it obtains its own animosities durable for life, which are not to be extirpated but by the greater Secrets.

The same way also sudden or unexpected death hath oft-times made an entrance for it self; because such a vitiated matter is never of its own free accord drawn out from thence: For although the *Archem* be apt at length to consume his own nourishment; yet he doth not obtain this authority over excrements degenerated by a foreign coagulation, and so for that cause not hearkening to the vital power or vertue: For therefore that part hath assumed the title of the heart, stirs up swoonings from an easie occasion, Falling-sicknesses also after the twenty fourth year; and likewise such affects as are attributed to the heart, are accounted incurable by those who have not much laboured in extracting the more potent faculties of medicine.

19 *Hippocrates* (by leave of so great a man, and of such an age, I speak it) was ignorant of this seat of the falling evil; because he was he who being constituted in the entrance of Medicine, faithfully delivered unto posterity, at least, his own observations, and Medicinal administrations sprung from these: For he said, "If Melancholy passeth into the body, it breeds the Falling Sickness; But foolish madness, if it peirce the soul."

20 If therefore black Choler passing over into the body, and soul, causeth the Falling-sickness and Madness: Whither therefore shall it proceed, that it may generate a Quartane Ague?

The Schools especially rejoyce in so great an Author for their humour of black Choler; But they are forgetful of a Quartane, which far departs from the Falling-sickness, and Madness: For after whatsoever manner they shall regard it, a Quartane shall either not be made from black Choler, or this shall not be in the body, nor in the soul while it makes a Quartane.

21 But as to what pertains to Madness, and the Falling-sickness, as if they were separated only in the diversity of passages; or that the same humours did sometimes evaporate, or were materially entertained in the Inns of the principal faculties: Surely it is a ridiculous, although a dull, and plausible devise, to have found out the cause of all diseases in so narrow a quaternary of humours.

For first of all, The Falling Evil doth much more strictly bedrowse, and alienate the powers of the soul, although Madneses do that far more stubbornly or constantly: Wherefore the aforesaid diseases are far otherwise distinguished (let the *Genius's* of *Hippocrates* spare me) than in the changing of their wayes, and bounds: And which more is, the general kind of foolish Madness, shall differ by its species in its proper matter, and proper efficient: as is to be seen in madness from the biting of a mad dog, or stroak, or sting of the *Tarantula*: For the cause of things had not as yet been made known in the age of *Hippocrates*; the knowledge whereof, the *Prattle* of the Greeks hath hitherto suppressed: Neither also are wrothful doatages made from yellow Choler, bruitish ones from black Choler, and jesting or merry ones from blood: Surely otherwise we should all of us be daily jocound doaters, or deprived of blood: For feverish doatages are especially fercht out of a feverish matter, creeping into the shops of dreams, and not from elsewhere; But not that it forsakes the body, that it may enter into the mind. And likewise a doating delusion should never happen in a burning Fever, in a *Synochus*, or continual Fevers: but alwayes in *Quartanes*, and black Cholery Diseases. Truly, a Doatage is already from the very Beginning of Fevers: To wit, where the Fever and the Cause of the Doatage are jointy in the Root. For the malice being encreased, and the Organs weakened by little and little, the Doatage or Delusion ascends unto the maturity of its own perfection.

So in Wine, and also in some Simples, yea and likewise in feverish Excrements, a hidden Doatage is covered: neither doth it bewray it self, unlesse the power thereof shall ascend into a Constitutive mixture. At leastwise, all things do by the same Royal way, according to the Genius of their own malice, Rage on the Organs of the Phantasie, even as elsewhere concerning Madneses. The Seed therefore of the doating Delusion lurked from the Beginning in the feverish matter, which at length is promoted unto its due malignity.

If therefore Madneses differ in their matter, and efficient cause, That is, in their whole

whole Species, and Being : Surely the *Falling-sickness*, and *Madness*, do much farther differ from each other, and do more differ in a foreign Seed, than that one onely black Choler being exorbitant in its Seats, should bring forth both. Even as elsewhere concerning the *Dummirate*.

Madnesses (I will say in one word) are all nourished by the arteries, and in the Inn 22 of the Hypochondrial or Midriffes : According to that saying, *In whom a vein beats strongly in the Midriffes, those are estranged in their mind* : Therefore also they oft-times want an exciting disturbance before they relapse into a *Mania* or brutish madness ; Because this is bred by a perturbation very like unto that.

CHAP. VII.

The Succours of Physitians are weighed.

1. Of what sort the Succours of Physitians are.
2. The vanity of the same.
3. The hurt of local Medicines, and their feigned derivation.
4. The water in Vesicatories was meer venal blood.
5. An Objection solved.
6. A Vesicatory or embladdering Medicine is more cruel than the letting forth of blood.
7. To what end Vesicatories were devised.
8. A Clyster, why hostile to the bowels.
9. A Clyster never reacheth unto the gut Ileon.
10. Laxatives in a Clyster are the more sharp, being hurtful, as purging things are, but less hurtful.
11. A poyson hurts to have taken it inwards, by whatsoever title, and entrance.
12. That Fevers are never drawn out by Clysters.
13. They therefore hinder long life.
14. A Clyster, how it names Physitians.
15. A fore-knowledge from the use of Clysters.
16. It is a blockish thing to nourish by Clysters.
17. A conjecture.
18. The common sort of Physitians are taken notice of.

I have determined to examine the common Succours, before I determine of the nature of Fevers : But those are Scarifications, openings of the Fundament-Veins, Vesicatories, and others of that sort ; and they all concur unto the diminishments of the blood, strength, and body : And the which therefore have already been sufficiently condemned under universal Succours.

They are indeed foolish aids about the superficies of the body, when as the Central parts labour, and are besieged, and the which not being freed from the enemy, it is vain, and hurtful, whatsoever is attempted by the gestures of such Apes.

Surely it is a vain rudiment of hope, to be willing by consequence to remove the root out of its place, by taking away the guiltless blood from the skin ; which thing Prince *Infanto* the Cardinal, by his exhausted veins (the Circuite of his Tertian Ague nevertheless remaining) hath confirmed to Anatomists with a mournful spectacle.

And likewise a *Paracentesis* or opening of the belly nigh the navil in the dropfie, ought long since to have extinguished the like kind of hope. For there it is plainly an easie thing to draw out waters from the nigh Center, and daily to draw from the fruit a part of the water at pleasure : But in vain, because not any thing of the root departs : And so incision nigh the navil, doth only protract life for a few dayes. But let Vesicatories or embladdering Medicines be alwayes exceeding hurtful, and devised by the wicked spirit *Moloch* : For the water dropping continually from thence, is nothing but venal blood transchanged.

For while any one scorseth his hand, or leg, the fire calls not the whey of the blood unto the burned place ; Neither doth that water lurk in any other place, and waiting to run to it with loosened rains, while the skin should be at sometimes scorched. The water should be deaf at the call of the fire, neither should nature obey a commander from without

5 without. What if a water swims on the blood, which they call Choler; surely that floats not as being separated from the blood, except after its Coagulation or Corruption. Embladderers therefore intend this, but not Preservation, and Healing: That salt water therefore is not, but is made; it is not separated I say, from the Blood, but the Blood thereof is transchanged into water very like unto the Dropfie, Flux, and the like defects.

6 By so much therefore are Vescatories fuller of danger than the cutting of a vein; Because this is stopped at pleasure, but that not: the which after the cuttings of a vein, and vain Butcheries of the body is at length dreamed of for the hinderances of a Feverish Coma, and so for the adulterating of a latter effect: For they rejoyce to awaken the sleepy or deep drowsie sick, by reason of the pain of so many Ulcers: And how-
7 ever thou considerest of the matter, it is a cruel torture of Butchers: For neither is the drowsie sick ill at ease because he sleepeth; But he sleepeth because he is ill at ease: And so, to hinder the sleep is not profitable; But that only prevaieth, to take away the root of drowsiness.

They therefore who suspend the sleep only by pains, do cruelly drive the sick headlong into death: For they flatter the people in being cruel toward the sick party: In the mean time, they persevere in the office of a cruel, and unfaithful Mercenary Helper: For if the drowsie feverish person sleep, or being pulled, be daily awakened, such stupid allurements perform not the least thing in Fevers: Wherefore I am wont to give my remedies in at the mouth, and food at set hours, nor to regard whether he shall sleep, or not.

I say that ancient saying with the Apostles; *If Laxarus sleep, therefore he shall be healed*: For the tortures brought on him that hath a Fever, have never profited any one.

8 But as to what pertains to Clysters, it is a frequent, and shameful aid of Physicians: I at leastwise in times past, never perswaded, and described Clysters but with shame: But after that I obtained faithful remedies, I wholly abhorred Clysters, as it were a beast-like remedy, being declared by a Bird, as they say: For that every Clyster is naturally hostile to the bowels, is from thence easily manifest: Because all particular things are received after the manner, and in respect of the Receiver: The which I thus more largely explain.

The tear of the eye, although it be salt, yet it is without pain, because familiar, and nearly allied to the eye: But simple water is painful in the eye, and any other thing. The urine also, although it be salt, bites not the Bladder; But any kind of decoction whatsoever being sent in by a Catheter, although most sweet, causeth pain within: But if the urine shall draw but even the least sharpness from new Ales, or from elsewhere, presently there is a great strangury, and distilling of the urine by drops.

The dung therefore since it is a nearly allied, and household-content of the bowels, bites not, nor is not felt until it hath come down unto the fleshy parts of the strait gut, which do as it were perform the office of a Porter, and therefore do feel, and urge it: Whence I conclude, that every Clyster since it is a foreigner to the intestine, it cannot but be troublesome, and ungrateful thereunto.

9 Again, A Clyster never ascends unto the gut *Ileon*: For if thou castest in eighteen ounces, now a great part thereof remaineth in the pipe, or slides forth in its injecting, and so it reacheth only into the beginnings of the gut *Colon*.

10 In the next place, if loosening Medicines are in a Clyster (for the sick party that very much abhorreth laxative things, is for the most part thus deceived) as I have already hissed out the poyson of purgative things, so also the use of a laxative Clyster by a like right. I confess that a Clyster is of less danger, as the mouth of the stomach doth alwayes perform the most noble office of life, and as the life is hurt by the loosening poyson:

11 But at leastwise, none can deny but that it is a hateful thing to have admitted poysons within, by whatsoever title, and entrance: Because purgative clysters resolve the blood in the Mesentery.

12 And at leastwise, in speaking in the termes of Fevers: Non ever drew forth Fevers by clysters; because they have never come unto the places beset with a feverish matter, nor do ever comfort those places: Neither the while, do they cease to defile, and wipe out the blood from the veines which are co-bordering on the bowel.

For that thing I have learned from old men, that whosoever loveth a long, and healthy life, let him abstain from purging things taken into the body under what deceitful pretence

tence soever: A clyster at this day, is so familiar unto the more wanton people, that it is called a cleansing, and succour: As if they would cleanse the natural excrement.

Surely, however thou mayst look upon those wiles of Physicians; they are not but from evil, from deceit, and a lye: and do stir up shame in pious eares: And so they are now the correcters, the rinders of dungs, that is the inventors of evil arts. But there are some who have introduced a sluggishness in the intestine, by a clyster or some other vice, and therefore they afterwards perswade themselves that thence-forward they must accustom themselves to clysters: Surely the vice of binding of the body, as it springs from, and dependeth on a different Root, it is easily succoured by the proper terme of curing: For as he who hath the lesse loose belly, is sicke: So also he that suffers a slow one, laboureth.

The malady is to be cured; but not by cloaking by a clyster is the paunch to be daily provoked and loosened: For there is an easie prognostication, that by thus proceeding, the last things will be always the worst, and that the life which is committed unto such helpers, is of necessity cut short. Nations will subscribe to these things, as many as have laxative medicines in abhorrency: As the *Campanians*, *Ardennians*, and likewise the *Asturians*, &c. Unto whom, as a clyster is unwonted, and also unheard of; so there is a strong, and most frequent old age:

But besides, the last scope of a clyster is, that they cast in the broaths of dissolved fleshes from an hope of nourishing; the which truly is an argument of unfufferable stupidity. For those injected liquours do at first mingle themselves with the dung there found, and then they are poured into the parts, whose property it is to change all things into dung: and thirdly, it is manifest by experience, that such broaths, if they are cast back two houres after, they smel not only of the dung, but after some sort of a dead carcase: For seeing there is not a proceeding unto the second, or third digestion, but through the first: but that blood cannot in any wise be made of meates undigested in the stomach, and not changed into true, and laudable chyle or juice; it also followes, that broaths being cast in at the fundament, can never passe over into nourishment: Neither doth that prove any thing, that those broaths do carry dissolved flesh in them after the manner of chyle; for nothing is done, unlesse they shall first recieve the fermental properties of the first digestion, the preparatories unto life, which are not any where to be found out of the stomach: For whatsoever slides undigested out of the stomach, is troublesome, stirs up *Fluxes*, wringings or gripings of the guts, and also burntish or stinking belchings, and breeds the little wormes *Ascarides*. But those things which are injected from beneath, because they have not any thing of the benefit of the first digestion, are of necessity mortified: Because they experience indeed, the heat of the place; but are deprived of the true ferment of a viral digestion. Surely I commiserate the paultry Physicians, that they have wrested clysters aside unto such abuses, nor that they have once had regard unto the afore-said reasons; and I fear, lest they who so greatly flatter great men, after that they bid any one to take food, and three hours after do constrain him to vomite; that what he vomited up they should cast in through the fundament, into those who were pined with much leanness, and consumption for lack of nourishment.

Surely the ignorant flatterer, is a slavish kind of catel, acting the part of a Physician, yet not having any thing besides the diminishments of the body, and strength; refusing to learne, because he hath grown old in ill doing, neither hath he ever diligently searched into any thing worthy of praise, as being wholly intent upon gain, and as soon as he is dismissed from the Schooles, alwayes insisting in their steps, excusing the deaths of men, because he hath cured according to art, as having followed the flock of predecessours: Unto these men *Seneca* saith, many have not attained unto wisdom; because they thought that they had attained it.

They esteem it to be a thing full of disgrace, that himself being once a Doctor or Teacher, ought as yet to learn of others. A nourishing clyster therefore, is an old wives invention: For I have seen broaths in the more strong persons to have been rejected as horrid, through the stink of a dead carcase; but in the more tender persons, to have provoked swoonings: when as in the mean time clysters of Mallow, and Brans, cherished a lesse discomfort. Vain therefore are the common helps taught by Physicians, for the intentions, or betokenings of Fevers; Because they take not away, subdue, or reach to any thing of the roote of Fevers.

CHAP. VIII.

The usual Remedies are weighed.

1. A censure of distilled waters. 2. Of what condition essential waters may be.
3. A censure of decoctions. 4. The comforting remedies of Gold, and pretious stones are examined. 5. A mechanical demonstration of abuses. 6. Gems are not any thing dissolved in us, however they are powdered. 7. Pearles that are beaten, and dissolved in a sharp spirit, are examined by the way. 8. The Author testifies his own bashfullnesse. 9. The Pearles which are dissolved in the shops, are not Pearles. 10. Pearles, or Coralls being dissolved in some sharp liquor, remaine what they were before. 11. Five remarkable things taken from thence. 12. The help of an old Cock, an old wifes invention. 13. Alkermes is examined. 14. Comforting remedies are in vain, when as the enemy within tramples even on the strongest sick.

The internall remedies used by Physicians in Fevers, if they are look't into, will be found to be of the same leaven with the other of their succours: For except that they are brought into one heat, as it were the scope, and hinge of the matter, they are as yet of no worth in themselves, neither do they any way answer unto a putrified matter.

- 1 For first of all, distilled waters, as well those which are called cooling ones, such as are those of *Succory*, *Lettice*, *Purslane*, and *Plantaine*, as those which are of the order of the greater alterers, such as are those of *Grasse*, *Dodder*, *Maidenhair*, *Carduus-Benedictus*, *Scorcionera*, &c. Or those also which are fetcht from cordial plants, are in very deed, nothing but the sweates of herbs, but not their blood; and I wish they were not adulterated for the perswasion of gain.
- 2 For they are the rain waters of green and fresh herbs, but not the essential liquors of the herbs which shew forth the whole Crasis or constitutive temperature, and flavour of the thing. Therefore they cover an imposture in their name, and in the mean time the occasion of well doing slips away.
- 3 Moreover, the decoctions of plants, since they containe the gums, and mucilages of simples, they provide pain or cumbrance for a feverish stomach, loathings, overthrows, and other troubles; therefore also, they joyn themselves with the excrements, and are sequestred, after that they have procured all those perplexities: nor at least wise, is any thing of them carried inwards unto the places affected, and vitall soiles.
- 4 Physicians also, are wont to brag of their exhilarating Cordials, and restoring remedies prepared of Gold, and gems or pretious stones, surely from a like stupidity with the rest: For although they are broken into a fine powder, they undergo nothing from the fire, and much lesse do they suffer by the digestive virtue.
- 5 For they are first made into a light powder in a brassen mortar, and the gems shave of a part of the brasse with them, because they are harder than any file. And that thing I have at some time demonstrated to the shops, while as I steeped that powder of gems in *aqua fortis*: For a green colour presently bewrayed it self, and the *Apothecary* confessed that his fortifying remedies acted most especially, by communicating verdigrease or the rust of brasse unto the sick.

And then, if gems are afterwards the more curiously beaten in a grindstone or marble, which

which is far more soft than themselves, they increase in weight, and become comforting marbles, and stones, beyond the original gems.

For at length, gems that are made into a light powder, do no more profit than if flints, or glasse powdered are taken: And that thing, as many as have ever been diligent in examining the resolution of bodies, will subscribe to with me, and with me will pity the empty blockishnesses of *Physicians*, and the unhappy clientships of the sick.

Yea they administer Pearles, and Corrals being beaten to dust, or dissolved in distilled vinegar, or the juice of limons, and again dried, and solvable in any potable liquour: But Pearles are not of the same hardnesse with Christalline gems, but of the Animal kingdom, and they containe most pretious natural endowments, they cannot but bestow a famous help. For Pearles are of their own accord resolved indeed in the stomach of a Pigeon, but in ours they do not undergo any thing, whether they are drunk being beaten into a powder, or being dissolved as before.

For first of all it is to be noted, that I before my repentance, had learned by some pounds of Pearles being so prepared, that it was only vaine boasting whatsoever *Physicians* promise concerning them: And then, that a true Pearle hath not within it a mealy powder, and that of a different likenesse from its own bark: but that the whole body of the Pearle even unto its center, is meere little skins, laying on each other as it were the rhines of onyons spread under each other; which thing, they know with me, as many as have known how to reduce Pearles of an egg-like figure unto a circular Pearle: But the aforesaid barks of Pearles are in no wise dissolved by the aforesaid sharp things; therefore they shall dissolve only the meale of false Pearles.

Yea although the aforesaid barks were dissolved, (which they are not) the Pearles should as yet be the same powder which they were before: To wit, wherewith the salt of the sharp dissolver is now combined, and so it happens, that that salt of the dissolvent being dissolved, the powder of Pearles, or Corrals which that salt drinkes up, is also solved together with it.

Which powder, however it may be reckoned to be dissolved by the judgment of the eyes, and the substance of the Pearle thought to be changed; yet it is nothing but a meer deciet, and delusion of the sight. For Pearles, or Corrals do as yet remaine no otherwise in their own former nature, than otherwise, Silver remaines safe being dissolved in *Chrysulca* or *aqua fortis*, it been plainly unchanged in all its former qualities: For otherwise, the same silver could not be fetch't again from thence, seeing there is not granted a return from a privation to an habit.

They therefore that drink Pearles thus solved, so far is it that they enjoy the milky substance of Pearles, that they drink unto themselves nothing but the dissolved salt of the vinegar: The which I thus prove by handicraft operation: If thou shalt poure some drops of the salt of *Tartar* on dissolved Pearles, or Corrals, the hidden powder of the Pearles presently falls to the bottome; which is a demonstration of the deed.

First therefore, the pearles of the shops are not true ones, but a certain abortion of those sowed within through the middle substance of the Pearle.

Secondly, the powder of Pearles, or Corrals dissolved, although it may delude the eyes: yet it is not truly solved, it remayning the powder which it was before.

Thirdly instead of comforting remedies, they substitute nothing but the acide salt of the things dissolving.

Fourthly, that powder being thus solved, cannot be made blood, and therefore neither can it enter into the veines.

Fifthly, what if it had entred unto the Liver; hollow veine, and so by the power of digestion, that sharp salt adhering thereunto had at length been wasted into a transmutation: What other thing should such Comfortatives performe, besides to besmeare the veines within, with a forreign powder? And at length to load an unobliterable malady with a forreign guest? This is the harvest that is to be expected from Gems.

It is an alike doating monstrous thing, which they promise concerning the broath of an old Cock being joyned with herbs: For first of all, there is more of life, and strength in the more young birds, than in decrepite ones: Let the judgment be brought unto Hens.

And also medicinal broaths are ungratefull, and troublesome to the stomach, and

so they are easily dismissed unto excrements: Therefore after this manner, under a changed maske, they again dissemble their Apozemes under the broath of an old Cock.

- 13 Last of all, there is the Antidote Alkermes, which although, as it consisteth of the Syrupe of the grain that dieth Scarlet (I wish it were not adulterated by roses) it be laudable; neverthelesse, inasmuch as it being scorched and roasted, is impregnated with the more crude silk untill that it can be powdered, the whole power of the dying grain is vitiated: which silk being thus roasted, is nothing else but the wool of filke wormes depraved or vitiated by burning.

For the invention of some coverous old man brought up that thing, as thinking that nature is exhilarated or rejoyced with things that delight the eyes.

Far be it, for neither Gold, gems, nor pretious stones as such, shall refresh the vitall spirits, and much lesse crude silk roasted, and that if it were tinged with a Purple Colour; unlesse the vitall spirits shali well perceive restorations to themselves by the additions of strength.

But moreover, vaine are comforting, and cordiall things which are wished for; the fewel of Fevers remayning, and the blood, and strength being diminished.

- 14 For if a Fever prostrate a strong person, and one that is in good health, how shall it suffer him to be strengthened being now dejected? Especially by things which are forreigners in the whole general kinde, nor agreeing with the spirits in the union of co-resemblance?

How shall a Citizen fortifie himself, who hath received an household enemy stronger than himself, into his possession? The wane therefore, and vain promises of Physicians concerning fortifiers and strengtheners, are full of deceite.

- For he that exhausteth the strength or faculties together with the blood, and withdraws them by evacuating medicines, but forbids wine, and things that do immediately restore the strength; also who continually prosecutes after cooling things as enemies to the vitall heat; how shall he procure strength by such electuaries.

CHAP.

CHAP. IX.

The true cause of Rigour or the shaking
fit, in Fevers.

1. Rigour or extreame cold; and trembling, is from the spirit making the assault, but not efficiently from the diseasing cause.
2. Why he intends Rigours.
3. Why he stirs up cold and heat.
4. Why he begins with cold.
5. The Authour runs not back unto the lawes of the microcosme.
6. There are intermittences almost in all agents.
7. The manner of making cold.
8. The manner, and cause of rigour.
9. A marke of ignorance in Galen concerning the tossing of a member.
10. The burning cause of a Fever.
11. That every motion, as well an healthy, as a sick one, is made efficiently by the Archeus.
12. How the Authour learned that thing.
13. The turbulency of the Archeus disturbs the urine.
14. The ordinary office of the Gaule is troubled, and makes the Chyle bitter.
15. Wherefore also the bitter vomitings thereof diminisheth nothing of a Fever.
16. Whence is burning heat, and sweat in a Fever.
17. What sweat may betoken.
18. Sharpnesse increaseth cold, the which an Erisipelas proveth.
19. A Gangrene, how it may undoubtedly be stopped.
20. Why the beginning of a continual Fever is from horror.
21. Paracelsus is noted.
22. The errors of Galen, especially concerning the putrefaction of the blood, and spirit.
23. The true seat of a diary, and hestick Fever.
24. The fabulous similitude of Galen for the parching heat of an hestick Fever.
25. Why lime is enflamed by water.
26. A mechanical proof.
27. The blockish cause of gaping.
28. The true cause, and the organ of the same.
29. Sleep, the drowsie evil, giddinesse of the head, Apoplexy, &c. are from the mouth of the stomach.
30. Gaping is not in the muscles of the cheekes, or jaw.

Hippocrates first put a name on the Spirit of life, to wit, that it is that which maketh the assault, and the guider of all things which happen in us: which prerogative surely, none hath at length, called into question: In the mean time, the Schooles that succeeded, being as it were giddy with the vice of whirling about, have wrested aside the causes of trembling into old wives fictions. The Spirit therefore being the Prince of the world in us, hath alone obtained a motive beginning in us, as well local, as alterative; to wit, conteyning the cause of Rigour or extremity of cold, as well in respect of locall motion, as of the alterations of cold, and succeeding heat.

For the Archeus intends by trembling rigours, to shake of the excrement adhering to the similar part: Even so as a spider also, shakes her cobwebs, and jogs them with rigour, that she may shake of a forreigne thing which lighteth into them.

But the Archeus taking notice, that he can little profit by rigours or shaking extremities, stirs up an alterative Blas: All which I have elsewhere taught, to consist naturally, in Winter, and Summer, cold I say, and heat: To wit, through the successive interchange whereof, all sublunary things do decay in the coursary number of dayes.

From Winter therefore, in the very universe itself, the beginning of the year proceedeth, through a spring, and Summer, into *Autumne*, wherein the fruites are at length ripened: For whatsoever things are made by nature, undergo this beginning,

increase, state, and declining: So the *Archeus* himself (as all seeds, and vital things do imitate the nature of general ones) stirs up feverish rigours, colds, and heats: But not the offensive matter of the Fever, even as hath already been sufficiently, and over-proved at the beginning: For so also, in disjoyning of the bones, the teeth presently shake, and rigours spring up: And likewise while a woman with child untimely expels the not vital abortive young.

5 For neither do I speak these things, as if I fled unto the devise of the Microcosme of *Paracelsus*, although I give notice that the nature of the Universe doth observe a single manner in every thing: For truly nature is on both sides co-agreeable, and like to her self, which the sense of feverish persons complaineth of in Fevers happening unto them in winter, as in summer.

6 For he who in wrestling being short winded, hath failed, is for some time at quiet, and recovers his breathing, and by leisure repairs his strength, whereby he can shake off the Conqueror laying on him: so by a natural single Conduct, the *Archeus* in Fevers commands rest to himself by intervals, and afterwards his strength, and successive labours being re-assumed, endeavours to shake off the Fever his enemy.

7 Wherein surely the part wherein the feverish matter sits or sticks fast, doth first contract it self into wrinkles, which is easily perceived in the Midriffs: But the whole veinie generation by a certain consent, co-labours with the besieged part, and the oblique Fibers being drawn together, it strictly straightens it self: For from thence, a seldome, hard, and lessened pulse is the betokener, and work-man of cold: For every one that hath a Fever, if he mark it in himself, shall easily discern this co-wrinkled straitness of the veins, and that it is altogether natural even unto him that is in good health: For although the Cod may hang down as loose, yet presently as soon as the droffie dung of man slides down to the muscle of the straight gut, the Cod is co-wrinkled of its own accord.

8 It is therefore a natural thing to the veins, and parts that are chiefly affected, to have contracted themselves into wrinkles: since therefore that the arteries are for the most part everywhere adjoyned with the veins, it must needs be, that these together with the veins, are contracted by an oblique or crooked Convulsion: which thing surely, feverish persons shall easily perceive, if they being mindful of these things, do give serious heed unto those things which they feel: This therefore is the cause of cold in Fevers.

But that trembling, seeing it is in the Muscles themselves, it is to be noted that the Muscles have two motions: One indeed as they are the Clients of the Will, that they may utter a voluntary motion: But another, inasmuch as they are carried with a motion of their own against the consent of the Will: And this again is twofold, to wit, the former which is contracted by one only violent drawing, even as in the Convulsion, Cramp, &c. But the other which suffers intervals, such as is an aguish; or feverish trembling, the tossing, and trembling of some one member (to wit, of the head, or hands, &c.) being familiar unto old age, and Drinkers.

9 Truly *Galen* passeth it not by without observation, but he is received with laughter: For he teacheth, That such a trembling of old age is made from the striving of weight with the voluntary motive faculty: And that this faculty indeed endeavours to lift up the member, but by reason of weakness, that it stops the motion begun, being hindered by reason of the weight of the member: As if indeed, the voluntary motive faculty should endeavour against the consent of the will, to lift up a laying, and quiet member, that it might continually leap a little. I return unto the terms concerning Fevers.

Since therefore, not only the skin (as in the Cod) but also all the particular membranes are by a motion proper, and natural unto themselves, crisped, wrinkled, and contracted, it is no absurdity to give also unto a Muscle its own motion: For so also after death in a *Tetanus* or straight extension of the neck, the Muscles on both sides are extended a good while after the death of all will: For so the poysonous quality of purging things doth oft-times pull the Muscley parts together; and in Fevers that are mortal, there are involuntary Convulsions, with an interposing slackness: Of which motions, seeing I have largely treated in the Treatise concerning the Convulsion, it shall be sufficient to have admonished in this place, that those two motive faculties do naturally belong to a Muscle: One whereof is idle, and at rest, as long as the Muscles are in a good state; but it is moved as it were an auxilliary or assisting one in the encountering of things troublesome unto them.

10 At length therefore when the *Archeus* hath observed, that he profited nothing by an oblique convulsion of the veins, and arteries, and by the trembling of the Muscles; as Wroth,

Wroth, he frequently moves any thing, that he may shake off from himself the foreign enemy.

Wherefore I repeat that which I have divers times spoken; to wit, that all motion 11 as well in healthy, as in sick persons, doth immediately proceed constitutively, and efficiently from the *Archeus* which maketh the assault; but occasionally from occasional causes.

The which I at first mechanically discerned by some remedies of Fevers; Because if 12 they are given to drink on the very day of the fit, and at a seasonable hour, they do oftentimes take away many Fevers at one only turn: For that opportunity is in a small hours space before the fit; to wit, as much as the actuating of the Medicine doth require, and with an empty stomach: For if it be given in the dayes of rest of intermitting Fevers, or a good while from the beginning of the fit, while the Medicine fore-feels not nature to be an assistant unto her, as well to actuate or quicken, as to expell the occasional matter of the Fever, it is handed forth in vain: Yea then the Medicine vexeth rather than helpeth, as it spurs up nature unto a banishment, while she had rather be at rest.

But in the Plague, Malignant, and other continual Fevers, if it be reached forth to a fasting stomach, nor the action thereof be disturbed between while by drink, it for the most part supplies the whole office of curing at one only turn; else surely while the veins are strained, and grieved, or otherwise, nature is called away from her work begun, or is made to awake in the middle of her rest, the indignations of the *Archeus* are the more provoked: Neither hath it been sufficient here nakedly to have said, That the *Archeus* in Fevers first stirs up a Blas of cold, and afterwards of heat, as seeds do imitate, and bear in themselves a figure of the world: For truly nothing is naturally moved by it self, except the *Archeus*, who is the first mover of the living Creature.

For I know that a vigour is granted unto every seed, that this vigour being once stirred up, it is afterwards fit for moving of it self by its own vertue, and all other things thence-forth, besides it self, which are contained under the spear of its own activity: Therefore troublesome, and confused utines are voided forth, sharp, and undigested vapours, 13 and also brutish ones are stirred up, which go into improper places, increasing the cause of the cold.

But the Gaul which regularly changeth the sharp Chyle of the stomach into a juyce salt, 14 (as may be seen in the urine) doth by a rash endeavour now convert the juyce inserted in the gut *Duodenum* into a bitter juyce.

The *Archeus* in the mean time, being then wholly intent upon expulsion, doth oftentimes under the aguish cold, shake out this bitter superfluity, otherwise painfully thirsty: 15 notwithstanding neither doth a feverish person profit any thing thereby, because he forthwith casts out that which was newly defiled: Because it is an excrement produced in Fevers, but not the occasional root of the malady.

At length therefore the *Archeus* being as it were angry, enflames himself by his own animosity, (but not by heat drawn from putrefaction) and assaults his enemy, is in a raging heat, and at length pours forth a strong smelling sweat; For no other end than that 16 he may expel the enemy, under which expulsion he makes manifest that this same feverish matter is naturally to be driven away, and sheweth to the Physitian that nature is 17 to be led whither she of her own accord inclines: That is, That *Diaphoreticks* or transpiratives alone are the appropriated, and specifical remedies of Fevers: For in the beginning of an *Erisipelas* there is an unwonted small cold, yet not rigour, because the vapoury sharpness is as yet little: The which when it shall reach unto the superficies 18 of the body, it proceeds out of its own proper Inn, there to wax sharp, and putrifie: 19 And therefore a soapy, and lixivial Medicine quenches an *Erisipelas*: as also a strong Lixivium or lye, mightily stops Gangrenes that are deeply scarified; Because in Lixivials all sharpness dies together.

Continual Fevers do likewise from a sharpness detained within, at first cause rigour or a shaking extremity, and afterwards even unto their end or consumption, burn with heat. The heart-bearing also exerciseth idle persons, and the Gluttons of Wine, even as also Artists who are long, and much busied about *agua fortes*; Because a vaporeal sharpness doth everywhere pass thorow our innermost parts, yet without a Fever: For 20 an occasional matter is wanting. 21

For *Paracelsus* from the one only fire of *Aetna*, of Sulphur, and Nitre, divines of above sixty particular kinds of Fevers: Neither as being on either side void of a method, discovered he any fear for Fevers.

But *Galen* as he disposed of the seat of intermitting Fevers in the little mouths, or

extremities of the veins: so he appointed the nest of continual Fevers beneath or beyond the liver.

- 22 But a *Synochnus* or a Fever of daily continuation, as well that which is putrified, as that which is not, he placeth through the hollow vein about the heart. A diary Fever also, or that of one dayes continuance, he constitutes in the very vital spirit, and so also in the heart it self; Than which never any thing could be more blockishly supposed, than to decree the vital spirit to putrifie, life remaining.

For seeing that it is the only Balsame which vindicates us from corruption, what at length shall be left, which may balsamize the Balsame it self, if this shall putrifie? Or what shall season salt, if it be corrupted? For if it should be putrified but in some small portion of it self, the whole shall of necessity presently be defiled; seeing there is a most potent constitutive mixture of spirits into spirits, and a proper or natural co-resemblance betwixt them. For the life is scarce protracted for a quarter of an hour in the Plague, while as the contagion invades the spirit: In like manner, if Putrefaction layes hold on the blood, presently, as if a Gangrene were continued in the blood, a necessitated death ariseth.

I will therefore shew both the seat, and matter of a Fever in such a manner, as experience, and a long diligent search of things have made manifest unto me. My speech is of Fevers which are by themselves alone; but not from those that are bred from a strange passion.

- First of all therefore, a Diary, and that which is called an *Ephemeral* Fever from the duration of one day, sits in the hollow of the stomach, and is for the most part from vitiated food: Wherefore also after vomiting, or the finishing of digestion, it ceaseth of its own accord: Likewise a Consumptional or Heetick Fever, is a certain Quotidian or daily Diary, returning soon after food is taken, from a part of the meat being corrupted: For although the appetite remaineth safe, and they eat as it listeth them, at leastwise the Corrupter in the lungs ceaseth not, or is idle, but he continually transchangeth the venal blood into yellow, hard, thick, and sometimes ashie phlegms: Under which labour of Corrupting he calls away the spirit from the offices of digestion, and a certain kind of Corruption is made of the food that is half digested.

- 24 And it is a shameful Fable of the Schools in this place, which they devise unto themselves for this slow Fever; For whereas it might especially accuse Putrefaction, for heat, it dared not so bestow it; To wit, because Lime is enflamed by the sprinkling of water thereon, that it happens after the self same manner in a Consumptional Fever; To wit, That that Fever growes strong, and seems to assault after one hour, or an hour and an half after meat, as the solid parts are then be-sprinkled with the nourishment prepared from the meats received.

First of all, That withstands these things, because the concoction of the Chyle is not yet finished in an healthy stomach within two hours, and much less is sangification compleated; and least of all is there a transchanging of the blood into a secondary, and spermatick nourishment; because it is that which they say is dispersed into the innermost places of the solid parts in manner of a dew; and most longly, and slowly doth the Lungs borrow this new nourishment from the liver: Therefore the solid parts cannot be be-sprinkled like lime, and from thence be enflamed, as long as there is buisiness with the Chyle in the stomach. And then that similitude of lime is of meer ignorance:

- 25 Because it is that which is not enflamed by reason of the be-sprinkling, by it self, but by accident; In regard that no salts do season, or act as long as they are dry, that is, unless they are dissolved: But in *Calx vive* there is a two-fold Alcalized salt: One indeed Lixivial, and the other sharp, and both of them distinguished by the sense of tasting; which two salts being dissolved by water, while they act on each other they are inflamed; which same thing happens in hot baths, in the sharp salt of fountains acting on the lixivial first matter of fire-stones: That very thing by handicraft operation, and from the effect, not indeed by reason of what; but because it is so, I thus prove.

- 26 For if thou shalt pour the sharp liquor of Vitriol upon the salt of Tartar, straightway both of them being actually cold, do burn with heat: And therefore if out of Lead being calcined in the spirit of vinegar, thou shalt abstract all this spirit, as soon as the *Alkali* thereof shall drink in a moisture out of the air, it really conceives fire even in the Scrip.

Wherefore the Schools have not known, that if Lime were not enflamed by a mutual agitation of the spirits of its salts, it could never become a stone.

Again

Again, What is there in live bodies which may resemble the dryness of Lime? What I say, which is actually dry? Is lime? and not thoroughly wet with a daily, and continual dew? Is not the digestion of the solid parts continual, and un-interrupted? Surely however I consider it, they hand forth trifles for the Elements of nature, and the similitude of Lime with an He&tick Fever is full of blockish ignorance.

And as gaping accompanies many Fevers; so surely they have gapingly, and feverishly delivered all things.

For the sake whereof we must note also, that there is a foolish cause rendered by Galen for Gaping; To wit, That smoaky vapours being heaped together, do stir up the Muscles of the Jaw that they may be expelled:

First of all, very many smoakinesses should blow up those Muscles, in whom there is much necessity, and frequency of Gaping.

And then seeing those smoaks should be the unsensible superfluities of the last digestion; Why should such a kind of superfluities rather stir up an expulsion of themselves, than those of other parts? Why should they not daily be diligent in that? and why do we not sometimes gape for forty dayes together? why are those smoaky vapours more obvious in Fevers, than in the Gout, and Apoplexy? Certainly there is no function of our body, which is more moved by example than gaping is: For we easily follow even unwillingly, and against our wills, him that gapes.

Gaping therefore is not from a smoaky vapour, but from that faculty, and part which obeys the imagination: For the Schools admit with me, that the mouth of the stomach is most readily moved from a beholding; Because very many do most aptly loath, and vomit, filths being beheld, or imagined: And the eating of a sour Apple being seen, the mouth in many waxeth liquid with spittle: The mouth of the stomach therefore is especially moved at imagination.

Indeed sleep, likewise a deep drowsiness, the Coma, the Catochus, Catalepsy, Vertigo or Giddiness, and accidents of that sort, do issue from the mouth of the stomach (even as elsewhere concerning the Duumvirate:) But Gaping is a fore-shewer of, and Chamber-maid of sleep, therefore I attribute Gaping unto the same part. For the Phantasia the inhabitant of the first sudden invasions or violent affections dwells in the same place, and therefore it hath received the surname of the heart: So also from a sorrowful message, frequent sighs are drawn, that they may lighten the mouth of the stomach being sensibly burdened.

Thus therefore from a dull or floatful stomach requiring slumbring, a desire of gaping strikes, and extends the Muscles that are restless, about the time of sleep, wherein it calls the Muscles of the cheeks, and rough Artery into its protection, no otherwise than as the straining bone about the organ of smelling, calls the Muscles of the breast unto its aid for sneezing; For even as the cause of sneezing is not to be sought for in the Muscles wherein it is made; surely much less doth gaping belong to the Muscles of the jaw.

Since otherwise, one may also gape, the teeth being pressed together, that is, by a contrary motion of the jaw.

For the Schools should more rightly have had respect in gaping, unto the rough Artery, which is drawn for two fingers downwards by a hererocital or irregular motion. In the mean time they never dreamed any thing of a smoaky vapour of that Artery, because it is that which alwayes sufficiently layes open, and is passable for air, otherwise it ought not to gape: For such is the compacture of the body, that even in things not necessary, the members do set to their mutual hands, and as if strange Organs did strive for their own right.

CHAP. X.

The Seat of Fevers.

1. The one only Seat of Continual, and Intermitting Fevers. 2. Fevers do vary from their occasional matter only. 3. The nest of Fevers, in what bounds it may be enclosed. 4. A burning Fever, and the Fevers Sunochi are nigh the mouth of the Stomack. 5. It is proved from the action that is hurt. 6. A Quartane is an Out-law in its seat. 7. The matter, and seat of malignant Fevers. 8. The Plague, how it is separated from other Fevers.

1 **T**He seat of continual Fevers differs not from that of intermitting ones: For this cause therefore continual Fevers offer themselves, which end into intermitting ones, and one the contrary.

2 Those Fevers therefore vary not in the sitting of places, or from the nature of their Inn; but for the sake of their occasional matter alone.

In this regard also I am repugnant not only to Galen, but also to Eernelius, concerning the Essential difference of the places of Fevers.

3 The nest therefore of Fevers is in the first shops; to wit, it is extended from the Pylorus or lower mouth of the stomach thorow the Duodenum, and the manifold vessels there; likewise thorow the greater bowels or intestines, the veins of the Mesentery, Spleen even unto the Liver.

4 But those that are the nearer unto the upper mouth or orifice of the stomach, are by so much the more troublesome, and the more formidable in their perplexities.

5 A loathing, especially a great abhorrency of fleshes, fishes, and those things which readily smell like a dead Carcase presently after the entrance of Fevers, do confirm my Doctrine concerning the seat of Fevers: Likewise thirst, want of appetite, pain of the fore-part of the head, the Megrim of the left side of the head, Doargies, a deep drowsiness, Watching, local anguishes about the mouth of the stomach, burntish or stinking belchings, a prostrated digestion, vomiting, also a bitterness, dryness, chappings, blackness of the tongue, &c. Which things surely are the tokens of the Duumvirate its being hurt in the action of Government: hitherto have a supervening sharp or sour belchings, the little cloud of the urine access, and those things which prove the coction of the stomach to have returned, even as in the Treatise concerning The signification of the Urine elsewhere.

6 But a Quartane Ague alone hath chosen its Inn in the Spleen it self, and in the veins co-touching with it: But a malignant Fever alone, peculiarly challengeth something to it self of a matter putrified about the Orifice of the stomach.

7 But they are by so much the worse Fevers which shall not sit in the hollownes thereof, but in its boughtness; because nothing but an extraordinary Arcanum can reach unto those places: For therefore Camp, and all Endemical Fevers are more stubborn than others, and for the most part without thirst; wherein the heat is scarce perceivable, and a continual perplexity alone, brings the sick unto their Coffin: For these sort of Fevers defile only from without, and affect the last nourishment of the stomach; Because in very deed, the whole body as long as we live is transpirable, and expirable, according to Hippocrates.

For I have elsewhere demonstrated, that the Lungs, and Diaphragma or Middriffe, are on every side passable with pores in live bodies; The which, while Endemicks pass thorow, and smite the Bought of the stomach, they oft-times infect the last nourishment of the stomach.

I have said that a Diary Fever, together with a Hæstick Fever, do sit in the stomach: But the Plague differs from other malignant Fevers in this, that since it doth not sit in feverish filths, as neither in the blood of the veins, it affects only the vital spirit it self with its odour, for that cause also it of necessity enters in, and goes out with the air through the pores of the Diaphragma, and so that it tends thus primarily unto the stomach; not being able to proceed further by a local motion, it there makes its own impression to stick in the nourishment of the stomach: From whence there are presently Vomiting, Head-ach, Drowinesses, Doatages, Swoonings, and those things which obtain a Dominion over the mouth of the stomach being vitiated.

CHAP. XI.

The Occasional Causes of Fevers.

1. The occasional cause of Fevers, is not the true containing cause thereof,
2. Why an occasional cause is divers in its self.
3. A two-fold occasional cause.
4. The venal blood is a composed and simple natural thing; and therefore not made up of unlike parts.
5. The first occasional and material cause of Fevers.
6. A second matter.
7. The ignorance of the Schools concerning the tincture of the urine.
8. Why the urine is the more slowly tinged.
9. The false Judgements of the Schools concerning Urines.
10. A Fable of the Schools concerning the gaully tincture of the Urine.
11. An Argument of the Schools from the ignorance of Galen.
12. What should more rightly be collected from thence.
13. The Archer of a doating delusion, where he inhabites.
14. Why in a doatage a remedy is not to be applied to the head.
15. From whence all Apostemes are bred.
16. The injury of the Schools.
17. Whence the cloud that swimmeth in the Urine is.
18. A good Physitian why he neglects a Crisis.
19. What coction in Fevers may be.

THE Schools shew forth a foul and miserable, yea and mournful spectacle everywhere easie to be seen: That since a Fever openly talks with us, yet they have known it nothing the more for so many Ages, as neither do they know radically to expel it: Because Fevers are now not any thing more successfully cured after two thousand years experiments, and dissections, than in times past from the first.

For indeed, whatsoever is the cause of the cause, that very thing also is the cause of the thing caused; Wherefore the occasional cause being uncessantly present, and entertained within (which others call the containing one) is the cause of the internal cause of Fevers, (which I will by and by declare) of the Fever it self, and of accidents sprung from thence.

For if the occasional cause were the true containing cause, and matter of the Fever it self; truly there would never be any intermitting Fever: For the essential causes being supposed which are requisite to a Fever, the Fever also is of necessity present; But the occasional cause is present from the beginning even to the end, the which, if it were the containing cause, and did effectively contain the essence of a Fever in its own bosome, the Fever also should be present as long as that containing cause is: But the Consequence is false, therefore also is the Antecedent; That is, that cause is not the containing one, and of the intimate Essence of Fevers, but external unto it, and therefore occasional.

And seeing in the variety of the occasional cause, a reason consisteth, whereby it is either continual, or intermitting; Also why it is more or less troublesome, swifter or slower, according to its expulsion: It must needs be, that not one only seminal occasion of one corruption is to be granted. Since therefore the definition of things is most fit-

ly fetched from their constituting and essential causes (even as elsewhere concerning logical matters) I have therefore appointed a two fold matter of the occasionall cause: both indeed new, and hitherto unheard of.

3 Unheard of I say, because I am he who do not acknowledge both the Cholers, phlegm, and venal blood, as the constitutives of the blood; neither do I admit of them in nature (Even as I have demonstrated by many arguments, in a peculiar treatise concerning humours) neither especially do I grant the blood to be made up of many unlike parts.

4 As neither if it were constituted from thence, that it could ever immediately returne back into its own constitutive parts, neither that it could shew those in the blood let out of the veines, and give an occasion of error to the Schooles; Since there is not granted an immediate return from a privation unto the former habite: Wherefore it is a frivolous thing to argue that there are four humours in the blood, that sometimes three, and sometimes four are seperated from thence by the corruption of it self: which question, as I have elsewhere described, as sufficiently sifted, it is sufficient here to have touched at by the way.

5 For truly, I have judged, that no aide is to be fetched from those humours, in this place: But in the last digestion of the nourishment, while the solide parts endeavour to assimilate nourishment to themselves out of the blood, it happens that degenerate alterations, and as it were wrong or rash abortions are very often made: This degenerate nourishment therefore, undergoing various abusive marks of its changing, doth also beget diverse Fevers.

And those first and supposed humours prepared out of the Chyle, and Chyme or cream, do far differ from the true nourishment of the solide parts degenerating through the trans-changing of the blood: Therefore Fevers arise, not from both the cholers, phlegme, venal blood, and spirit being putrified, but from secondary juices, not indeed putrifying, but degenerated in time of assimilation. But they degenerate through the admixture of a foreign matter, or from a foreign impression, or next, through the error of the Archeus, being wrothfull, or called aside.

6 Moreover, another occasional cause of Fevers, I derive from elsewhere: To wit, that because we undoubtedly believe by Anatomy, that the Meseraick veines being dispersed through the whole conduite of the intestines, do suck whatsoever liquid thing the Archeus also hath known would be familiar unto him: The aforesaid veines therefore, draw a certain juyce out of the utmost parts of the gut Ileon, and the more grosse bowells nigh adjoyning to these: But when there is no longer any nourishment in the same place, but rather a certaine dung; they suck unto them a Being hitherto unnamed; wherefore I ought to give it a new name: Therefore I call it Drosse, or liquide dung, being profitable in nature for its own ends: Because it resisting the discommodities of the urine, therefore also urines being tinged, do not so soon stonify as the more waterish ones do.

7 Whatsoever therefore hath hitherto tinged or died the urine, is the drosse, but not the gaule; even as otherwise, the Galenists being deluded, have seduced their young beginners (which thing elsewhere, more largely in the inspection of urine) and so their judgments concerning the tincture of urines, brought downe unto gawly and Cholerick humours, have respect to nothing but the drosse or liquide dung: For if but as even the least small drop of gaule should be in the urine (by how much lesse, so much as is required for a sufficient tincture of the whole) it should be wholly made bitter; but it doth not wax bitter; therefore there is no gaul in it: The major proposition is manifest from the breaking of the gawle in a fish, however exactly thou walhest the fish from the gaule, yet he is bitter in tast: But that the tincture of the urine is the drosse, is manifest by distillation: And the demonstrations hereof (in the treatise of Duelech) I have offered as obvious, to every one that is willing to make tryal.

8 In the last place therefore, the tincture passeth thorow unto the urine; because the comming of the Chyle that is changed into drosse, unto the gut Colon, is the slower, because this Colon is the more latter in its situation.

9 Therefore the judgment of the Schooles concerning the Colours, and content of urines have been hitherto false, and the divinations drawne from thence.

10 It is therefore a fine fable of ignorance in Galen, who saith: *In the morning I see my urine to be watery, wherefore I repose myself to rest, and after some space, I see it to be tinged, because Choler comes in the last place, and so my urine receiveth the last maturity of its digestion.* As if the urine in the bladder, if it be not let out, should be costed by its own maturity, or by an additament of the tinging Gawle? Surely Choler (if there were any)

any) should arise conjoynly with the other humours, and with the urine the whey of blood: to wit, by the same labour of the sanguifying Liver, the choler powred on it should tinge that urine, and not some houres after, unless thy can shew that it would be profitable for that excremental Choler to be kept for some time, and that seperated without the urine. But they thus argue on the opposite part, from an eventual conjecture, and from causes being badly understood.

For they say that it is of experience, that in continual Fevers, if after yellow urines, watery ones do suddenly appear, doating delusions are signified, by reason of Choler (according to *Galen*) crept up into the head: But it had behoved this man to have shewn, who the sender of that choler should be, who its conductor thorow the veines, and what the receptacle of that Choler: Whether the bosome of the braine (for there is no other hollownesse in the head) could bear that Choler without present death? and for what end nature should do these things, that from the sinks of the humours being nigh to an emunctory, she should bring feverish Choler, and that totally excrementitious, directly on the opposite part, unto a most noble bowel?

But I in my signification of Urines, have gathered from the same signs of the Urine, that the liquid dung is not brought through the veins after a due manner, unto the Urine: therefore it is certain, that it is detained elsewhere besides Nature; but that it is not brought unto the head, but unto the veins of the midriffe: that is, unto the seat of the Fever is that very other feverish excrement brought; whence I divine, the Fever to be hereafter increased, and from thence a doatage.

But that the Archer of doating delusions and of madnesse dwells in the Midriffs, is as well manifest from *Hippocrates*: In whom a vein strongly beats in the place about the short-ribs, he is by and by estranged in his mind: as from the property of the name received in the Schools, whereby they denominate the hypocondriacal passion from its seat: But because the mark of the Archer is the Brain, that he may stir up doatages and drowsie evils; that ought not to move the Physitian, that therefore he should apply a remedy to the head: For truly, that thing is alwayes to have applyed a medicine unto the effect, unto the shaken weapons, but not unto the Archer.

Wherefore as long as the dross or liquid dung is carried in a straight line unto the Urine, as its natural emunctory, it is well; but if it be crookedly brought unto some other place, there is a continual Fever, as well because it is an excrement in its own nature, as because it departs to an undue Inne: otherwise, the nourishment being degenerate in the way of the last digestion, is for the most part, the more mild, and without savour; and therefore it affords intermitting Fevers, and those the longer ones, as their matter is the more glewie: But the liquid dung is more sharp or cruel, and therefore it stirs up the more cruel continual Fevers, and those aspiring sooner unto a period. But these two excrements, or both occasional causes, where they shall conspire in one, they bring forth Bastard-Fevers, Epiala's, Semiteritans, those consisting of one and an half, and wandering Fevers; therefore intermitting Fevers stand in need of more powerful incisives or cutting remedies, then continual ones, because they have a more stubborn, and a more glewie occasional matter, which cleaves or grows to the vessels within.

But if that nourishment degenerates beyond the liver, it stirs up divers Apostemes, but not Primary Fevers. For because also in a Phlegmone or inflamed Aposteme, the blood, or nourishment of the solid parts, degenerates into corrupt Pus, it brings with it also a Fever, of necessity: And when it shall come unto the utmost, there is the less labour and pain; even as also by continual Fevers there is then a Crisis even like unto an Aposteme.

For why do not the Schools rather conclude of phlegme from the little cloud of the Urine, then of a sign of perfect concoction, if one only yellow choller tingeth the Urine? Surely that little cloud denotes chiefly, that the stomach hath recovered the ferment of its own sharpness: Whence the old man saith; That four belchings suddenly coming upon burntish ones, is a good sign: and so denotes a declining of Fevers to be present, or a Crisis: But a good Physitian ought to neglect Crises's, because he ought to prevent them: For nature causeth not a Crisis or time of judgement, unless when she alone carries the whole burden on set daies. A true Physitian therefore, ought to overcome the disease before a Crisis; and therefore neither doth he wait, nor wish for a Crisis: but an unfaithful one, the intention of nature being disregarded, either hinders, or enlargeth a Crisis.

But the Coction which is expected in Fevers, is a cutting, and cleansing away of the tough matter; but not that otherwise, nature attempts the digestion of the thing besides

nature, not cocteth any thing, except she pretend alwayes to assimilate it to her self, by a similar or alike and simple digestion: For oft-times therefore, a little cloud appearing in a Quartane, vanisheth away; because Coction, which the small Cloud signifies, is not a true subduing of the matter from a Primary intention, but only of the digestive ferment of the stomach: otherwise, the Feverish matter being once made the more fluide, a new Crudity happens not thereupon.

CHAP. XII.

The Diet of Fevers.

1. What is the most slender food of acute or sharp Fevers. 2. Herbie medicines are not to be mixed with meates. 3. Feverish persons may drink. 4. They must abstaine from fleshy foodes. 5. The madnesse of Physitians. 6. What sort of meat and drink is fit for those that have a Fever. 7. A debate concerning the use of wine in Fevers. 8. That a Fever, and heat are radically distinguished. 9. It is of little concernment, whether a remedy for a Fever be hot, or temperate. 10. An objection is refuted. 11. How great the inflammation of the Archeus is.

1 **F**ROM that one only precept of Hippocrates; that in acute or sharp diseases (he hath commanded) we must presently use a most slender food: But I do not interpret a most slender diet to be a strict fasting, or severe abstinence; nor likewise to be the broaths of fleshes, by whatsoever favour of herbs they are altered.

2 Truly those medicines are not to be mixed with meates; but all things are to be introduced by their own Stages.

3 First of all I detest in Fevers, an abstinence from drink: For if the Fever be hot and thirsty, but is deprived of moistening drink, it robs of blood, and of the nourishments of the solide parts; together with the strength: For as it is lawfull to unload the bladder even as oft as an importunate necessity urgeth, it craves not leave of the Physitian to this end: likewise also we must drink as oft as necessity admonisheth, seeing the one is not more agreeable to nature, than the other: Otherwise, the strict law of thirst, and obedience of its command being broken, hath already, a thousand times brought disgrace on the Physitian.

4 I also abhorre the broaths of fleshes in a Fever; for nature forthwith detesteth the same, and by how much the more meer or unmixed they are, by so much the more to be condemned according to the mind of Hippocrates: Impure bodies (so he calls those of feverish persons, whose stomach is burntishly stinking) by how much the more thou nourishest them, by so much the more thou hurtest them: For they hurt feverish persons; because Flesh, Eggs, Fishes, and fleshy broaths, are then easily mortified or corrupted, and do least of all nourish.

5 For it is like unto madnesse, to empty the veins, and again to be willing to nourish those whose digestive faculty is prostrated: To be willing to comfort I say where the enemy is within.

6 For then thin ales being joyned with wine, wherewith bread, being first boyled in water apart, even unto a glew or mucilage, it admixed, do most especially satisfie; And these being taken crude, and not boyled: For truly, by boyling, the vertue of those Drinks looseth, but not increase: For so that vertue being unsensibly mixed with the drink, satisfies both indications; neither is it to be feared least the sick party under this diet should perish through want: Especially since he is unworthy the name of a Physitian, who restoreth not the person that hath a Fever before the space of four dayes.

7 But moreover all the Galenists inveigh against the use of wine (although wines being secret-

secretly drunk, have a thousand times brought Reproach on the *Galenical Art*) because a *Fever* is nothing but a meer heat, being called by *Hippocrates* a *Fire*, and wine shall be to him that hath a *Fever*, such as oyl is for the extinguishing of fire.

But this Argument hath already before perished as an old Wives *Fable*, under the definition of a *Fever*: And by so much the rather, because it is contrary to daily experience: For as many as use Wine moderately in *Fevers*, do the more easily recover, preserve their strength, and are the sooner restored unto their former state: But they who after the diminishments of the body, and abstinence from Wine, do peradventure escape through the benefit of nature alone, they remain sickly for a long course of weeks.

For truly, none doubteth, but that the Plague is the most cruel, sharp, and swift *Fever*; but that it is loosed without the cutting of a vein, and purging, and only by sweats, and the drinking of the more pure wine.

None also doubteth but that *Triacle*, and other sudoriferous Medicines are hot, may be given to drink in Wine, yea and in *Aqua vite*.

And since these things as such, do not hurt, but profit in the sharpest of *Fevers*; much less shall Wine be taken away in the more mild ones; Especially, Because it is manifest, that heat is not the Constituter of *Fevers*, but a consequent thereof by accident. Neither is there place for arguing the difference of the Plague from other *Fevers*: For in very deed, the Plague floats in the *Archeus* as a poyson: But *Fevers* have a stubborn occasional matter, and that adhering to the veins: Therefore transpirative Medicines are required on both sides: in the Plague indeed Medicines that cause sweat, together with an Antidote against the Contagion of the poyson: But in other *Fevers*, *Diaphoreticks* which cut, dissolve, and cleanse: And truly on both sides, this buisiness is perfected by hot things.

But Wine hath a peculiar betokening, not only because it addeth strength, whereby nature subdueth the hateful matter; but moreover, because it is a convenient Chariot of Medicines: For indeed it is a Messenger that hath known the wayes, being fitted for the journey, being near to the innermost parts, and admitted into the inner Chambers of the body: For in a young, and strong man with a small *Fever*, there is great heat; when as in the mean time, in old men there is a mortal, and difficult *Fever*: yet it hath an heat scarce troublesome.

If therefore heat be encreased after wine is administred, the feverish malignity is not therefore encreased; Because a *Fever*, and Heat are radically distinct; The which I have already shewn by the *Fevers* of young, and old people.

It makes no matter, Although the trouble of heat shall a little increase through the drinking of Wine; For that is recompenced with usury; Because the faculties (the only Physitianesses of diseases) are increased by moderate Wine. This very thing, if it be more fully, and radically sifted, thou shalt find that heat doth not properly accompany a *Fever*, but the valour or strength of the faculties.

Therefore that which the Schools do so greatly abhor in Wine, is the mark of a good sign: For deadly, and the worst of *Fevers* are scarce hot; and every *Fever* about the time of death is without heat.

If therefore the motion of heat be that of the *Archeus* himself, for the expelling of the enemy, and wine add heat; therefore he who proceeds by Wine, heals according to the conformity of nature: Notwithstanding let us grant, that Heat, Wine being administred, is the greater, yea also that the *Fever* is the sharper: For what other thing follows from thence, than that the Wine shall increase the vital constitution? And that that state is nearer to the constitution of young folks, than that which proceeds by cooling things, or without the administration of Wine? for cooling means are more like to death, to cessation from motion, and to defect; But heat from moderate Wine, is a mean like unto life, and a means which the *Archeus* himself useth: For the Constitution of heat increased by Wine, is nearer to the Vigour, State, and Crisis, than if the strength being weak, there shall be the more feeble heat by abstaining therefrom: These things concerning the drinking of Wine.

But concerning the drinking of water; Let the decision be, that feverish persons desire not hot water, nor do they thirst after that which is luke-warm; but cold water is to be admitted in a slack degree, in the highest heat of the state of the *Fever*; Neither must we be afraid as I have said, of a co-mixture of the extreames; Because experience hath long since successfully shooke off this fear.

But in other stations of *Fevers*, neither is cold water, as neither is abundance to be drunk; yet thirst is never to be endured, not indeed under sweat; But then let the drink be

be hot: If thirst be urgent, and the *Fever* hath not the fodder of drink, the in-bred moisture is wasted.

But moreover, That which they accuse concerning the crudity of water, take thou thus: Water springing out of sand is simple, and the best, and it is to be taken from the fountain it self; But that which runs thorow Pipes, or issues out of a clayie spring, is now partaker of a mixt malignity: But this water I call not so much crude, as infected: For water by it self, deserves neither to be called crude, nor cocted, as neither is it ripened by heat, nor doth it attain any thing thereby; for it is sufficient, so that its highest cold be blunted: but none may use infected waters, as neither any cold drink in the Plague, and malignant Fevers.

9 But there is a larger reason for an hot remedy: But neither do I ever perswade a remedy which may moderate Fevers only by heat; but as Wine profits by comforting, and by more thoroughly introducing succours coupled unto it; So do remedies by cutting, resolving, and cleansing, and in that respect the more prosperously, because they have the *Archeus* in operating, agreeable to themselves; For thus far he co-mingles his own powers with the powers of remedies, that the occasional cause may be put to flight, and that the more firm health may not presently receive its strength prostrated.

10 At length perhaps they will object against these things: That since heat in a *Fever* is the effect of the spirit that maketh the assault his being wroth; It also followes, that from the measure of heat, the wrothfulness of the *Archeus* is to be measured, and by consequence, that whatsoever increaseth a feverish heat, doth also increase a *Fever*.

I have answered before, that there are many branches, effects, or various Symptomes of one root: And that oft-times, doating delusions, Coma's or sleeping Evils, intermitencies of pulses, to wit, things denoting an increased *Fever*, do happen under the more mild heat; Even as from a tender branch of an Acorn there is a greater leaf than from an old Oak.

There is therefore an *Elenchus* or fault in the argument, to say [the *Fever* is the greater in the man] for I abhor that increased *Fever*, the which mortal increased symptomes do follow:

But I in no wise fear the *Fever* to have increased, because the *Archeus* doth the more strongly rise up for the expulsion of the root of the *Fever*: And if they in conclusion call that thing an increased *Fever*, I little dwell upon it.

11 For so also the Schools perswade, that we are not greatly to be afraid of accidents unexpectedly happening besides reason. It is therefore to be noted, That the *Archeus* is never enflamed in his whole: For otherwise, about the end of the fit, the whole *Archeus* being dissolved or wasted, should be the cause of fainting.

The *Archeus* therefore is enflamed in much, or a little portion of himself: And therefore the *Archeus* being increased by Wine, if more thereof be enflamed, yet more of him is not lost (and yet he more strongly strained the occasional cause) than if the *Archeus* be not strengthened, and increased, and a less part of him be enflamed.

CHAP. XIII.

The Essence of a Fever.

1. Of what sort an Essential, and Natural Definition is. 2. Diseases are Beings subsisting by themselves, and not accidents. 3. Why Diseases inhabite in a strange Inn. 4. A Disease is not only a Travel, nor a Motion, nor a Distemper, nor a Disposition. 5. The Essence of a Fever, which the Schools are hitherto ignorant of. 6. There is therefore another Scope of healing than what hath hitherto been. 7. That the occasional Cause alone distinguisheth Fevers. 8. The cure of a Physician is made easie.

THE definition of a thing is not to be framed from the general kind of the thing defined, and from the constitutive difference of the *Species's* or particular kinds, even as I have elsewhere demonstrated in Logicks: Because besides rational and irrational, (if so be they are as yet the constitutive differences of living Creatures) no differences of like sort appear in the Schools: But a natural definition ought to consist of the material, and internal efficient, or seminal Causes: Because those two are those which constitute the thing it self, and that the whole, and they remain unseparably essential in it as long as it self is; and so they explain a thing by its causes, and the properties of these.

Truly Fevers have a matter, and an internal efficient cause after the manner of other Beings subsisting in them; although all diseases inhabite in a living body; because they are not Beings of the first Creation, but begun from the curse of the departure out of the right way; And therefore neither have they properly their own seminal Being which constitutes, and nourishes them; But they have an occasional Being from whence they are stirred up instead of a seed; The which ceasing, the Disease ceaseth.

As oft therefore as that which is not vital is inserted into a vital soil, the Archeus is angry and becomes wroth, that he may exclude that forreign thing out of his Anatomy:

The which I have perfectly taught in the entrance of this Treatise, by a thorn thrust into the finger: Therefore a Fever is not only an expulsive endeavour, or alterative motion, (and much less the alteration and disposition it self, as the Schools have otherwise thought) but a Fever is a material part it self of the *Archeus* defiled through indignation: For a part of the *Archeus* is defiled through anger, and receives an image or Idea of indignation, (the which is clearly expressed in a woman great with Child, fearing, or desiring any thing, while she conveys the seal of the thing desired on her young) and whatsoever of the *Archeus* is defiled by that forreign Idea, this ought to have been rooted out by the fit: so that that is the cause of wearisomness in Fevers, because the spirit being marked with a forreign likeness, or hateful image, as unapt for the performance of the wonted Offices of its government, totally vanisheth: For so those that profoundly contemplate, are tired with much weariness.

For the *Archeus*, if he hath an image brought into him, is unfit for governing of the body: For therefore persons void of care, the more healthy, more strong ones, and those of a longer life, do slowly wax grey: The endeavour therefore of a Physician is not to direct unto the effect, or unto the alterations naturally received in the *Archeus*: For (as I have said) in Diseases, all things depend on the occasional cause implanted into the field of Life; because Diseases have not in them an essential root of permanency and stability, as other Beings have which consist and subsist by their own seeds; Because in very deed, all do immediatly consist in the life, (therefore in a dead Carcase there is no disease) and therefore all the destruction, and cessation of these, depends on the removal of the occasional cause.

- 6 The Scope therefore of healing cannot turn it self unto the cooling of heat, or to the stupefying of alterative motions, as neither unto the expectation of Concomitant accidents, and produced effects: For the Physitian shall labour in vain, shall loose his labour, time, and occasions, as long as he shall not be intent on the withdrawing of the occasional cause: yea by how much the more he shall do that, by so much the more delightfully, and acceptably there will be help. In all Fevers there is one only inflaming, 7 or indignation of the *Archeus*, whence also they agree in the Essence, and name of a *Fever*, being distinguished only by their occasional cause.
- 8 Indeed the Matter, and Inne distinguisheth Fevers: yea it is of no great moment with a good Physitian, to have curiously searched into the diversities of Fevers according to the properties of the matter, and places, since it is neither granted him to have prevented them, neither can it be said to a remedy, *Go thou unto such a vein, or unto that place*; For it is sufficient to have known what things I have already before in general concluded: And let the whole study of a Physitian be, to have found out remedies, with whom all Fevers are of the same value and weight, as I shall presently declare.

CHAP. XIV.

A perfect Curing of all Fevers.

1. The property of the occasional cause. 2. why it becomes not putrified. 3. Vomitory and laxative Medicines cure only by accident. 4. The Schools why they have not had meet remedies. 5. None cured of Fevers by the Physitians. 6. The Authors excuse. 7. Of what sort the Remedy of a Fever is. 8. The successfulness, and unadvisedness of Paracelsus are noted. 9. The Description of an Universal Remedy. 10. A Remedy purging Fevers, and the sick, but not the healthy, is described. 11. The most rare property of the *Liquor Alkabeft*. 12. Particular Remedies of Fevers.

1 Therefore it is now manifest, and be it sufficient, that the occasional matter of a Fever is to be vanquished, and that that matter if it be not food corrupted (as in a *Diary*) at least, that it is an excrement, not indeed a putrified one, (unless in malignant Fevers wherein putrefaction is as yet in its making) but a strange foreign one, not vital, being detained against nature, and so brought into anothers harvest: And by this title altogether hostile to the *Archeus*.

2 For if it were putrified, it should not be tough, neither should it adhere as stubborn, (for by putrefaction the stedfast Fibers decay) and so neither should it afford daily Fevers, but it should presently make to putrifie, and mortifie the vessel containing it, together with it self, whence death would be necessitated.

3 The occasional matter of Fevers therefore, is detained besides the desires of nature, in undue places, wherein there is not any sink of the body: therefore vomitory, and laxative remedies, if ever they have performed any profitable thing, another prone & neighbouring matter is thrust out together with it: for otherwise, the occasional matter of Fevers doth ordinarily reside in the hollow of the stomach, or bowels, because they are sinks, and places appropriated for expulsion, unless perhaps in a *Diary* Fever, the disease called *Choler*, the *Flux*, bloody *Flux*, and other Fevers of these pipes stirred up from a matter adhering unto them: For I speak especially of the primary or chief Fevers.

4 First of all, the Schools could not seek meet remedies for Fevers, they being seasoned with

First of all, the Schools could not seek meet remedies for Fevers, they being seasoned with bad and false Principles: But they not seeking after remedies, neither also could they find them: Therefore Physicians being hitherto destitute of a true remedy, have endeavoured to cure Fevers, going into a Circle; But if any have been cured under them, that hath been by accident.

Let them give God thanks who hath bestowed strength on the sick, whereby they have resisted the Fever, and their succours.

Physicians therefore instead of curing Fevers, have neglected them by exhaustings of the strength, and blood.

Far be envy from what is spoken: for not boasting, or the vain desire of a little glory, I call God the Judge to witness; but mans necessity, and the compassion of Mortals hath constrained me to write, and make manifest these things.

I have bestowed my Talent, let him believe me, and follow me that will: It shall no longer lay upon me, if Mortals being rash of belief, perish by Fevers.

Indeed the occasional cause of Fevers is cut off by one only hook: That remedy is sudoriferous or a causer of sweat, which cuts, extenuates, dissolves, melts, shaves off, and also cleanseth away the occasional cause in whatsoever place it at length shall exist; And it is a Universal Medicine of Fevers, Diaphoretical or transpirative indeed, causing the aforesaid effects unsensibly, and without sweat.

For indeed *Paracelsus*, although he had *Arcanum's* or Secret Medicines, whereby at one only draught he alike successively cured the Quartane Ague, and all Fevers; yet the knowledge of their causes was not granted unto him: He being contented to have introduced into us all the particular Creatures of the Microcosm, and so under a rashness of belief, to have applied the Species, Numbers, and Properties of all Simples, and Stars unto the Medicinal Art; and that not indeed by similitudes, but he would have them to be so precisely known by a simple identity under the penalty of convicted Idiotism: Therefore I distinguish not a Fever, if there be the greatest goodness of a remedy: For that remedy is the Diaphoretick Precipitate of *Paracelsus*, which cures every Fever at one only portion:

But an Heftick Fever within the course of the Moon or in a months space: For it being taken in at the mouth, cures the Cancer, Wolf, and any eating malignant Ulcer, whether external, or internal; and likewise the Dropsie, Asthma, and any Chronical disease: For it alone perfects the desires of Physicians, as well in Physical, as Chyrurgical defects.

The description thereof is as well in his book of the Death of things, as in his great Chyrurgery, and I will somewhat more manifestly declare it:

Take of the powder of *Johannes de Vigo* being prepared with thy own hand: for otherwise it is adulterated by *Minium* being admixed with it, even as also any sort of Chymical Medicine whatsoever which is set to sale, is full of deceit.

This Powder, the Element of fire extracted from the Vitriol of Venus or Copper being poured on it, is to be five times cohobated with *Aqua Regis*, by increasing the fire about the end; for it is plainly fixed; And it is a powder exceeding Corrosive: The which afterwards let it be ten times cohobated with *Aqua vite* most exactly refined, and renewed at every turn, until it hath brought away with it all the Corrosion: And then that powder is sweet like Sugar: And therefore the spirit of Wine is there called *Saltaberi*, or *Tabarzet*, which sounds, Sugar: Not because it is sweet in it self, but it takes away the corrosive spirits with it self; so that the remaining powder shines in its own sweetness, and not borrowed from elsewhere.

For besides that the fire of Vitriol is sweet, the very Sulphur of the Mercury being then turned inside out, is of the greatest sweetness. That powder is fixed, and it is called *Horizontal gold*: For I have delivered a Secret unto a few, which ennobles a Physician: But to have prepared that Secret, is for the first turn of great labour, and the direction thereof depends on the hand of him unto whom all honour is due; because he reveals such Secrets unto his little ones, which the world knows not, and therefore hath a low esteem of them.

There is also the Purging Remedy *Diuceltateffon*, which radically cures the Gout, no less than Fevers: And it is called his *Corralline Secret*, which is prepared of the Essence of *Horizontal gold* after this manner.

From the common Mercury sold in Shops, abstract thou the Liquor *Alkahest*, whereof he makes mention in his second Book of the strength or faculties of the Members, in the Chap. Concerning the Liver: The which is done in a quarter of an hour: For saith *Ray-*

mund, my friends standing about me, and the King being present, I coagulated Quick-silver, and none besides the King knew the manner how. In which Coagulation that is singular, that the liquor *Alkabeft* being the same in number, weight, and activity, prevails as much in the thousandth action, as it did at the first; because it acteth without a re-acting of the Patient. The Mercury therefore being thus coagulated without any remainder of the Coagulator, make thereof a fine powder, and distill thou five times from that powder, the water distilled from the whites of eggs; and the Sulphur of the Mercury, which by its aforesaid coagulation was drawn outwards, will be made red like Coral: And although the water of the Whites of Eggs may stink; yet that powder is sweet, fixed, enduring all the fire of the bellows; neither doth it perish in the examination of Lead; yet it is spoiled of its medicinal vertue, while it is reduced into a white mettall. But it is for the most part given in the quantity of eight grains; because it purgeth the body of man as long as it is defective, and not perfectly sound: It heals also the Ulcers of the Bladder, Wind-pipe, and Throat. But since it belongs not to every Physician to go to *Corinth*, neither is it lawfull to prophane the Secrets of God, who would remain the Dispenser hereof; it hath been sufficient for me to have manifested the Theorie of Medicine: That by praying, seeking, and knocking, they may attain knowledge, from whence every good gift descendeth.

12 Notwithstanding there are some particular Remedies of Fevers, which although they ascend not unto the universal ampleness of general kinds; yet they for the most part give satisfaction in Fevers. Of which sort are the salts of Cephalical things or things for the head, and likewise of *Marioram*, *Rosemary*, *Sage*, *Rue*, and the like: not thinking that these salts are the Alcalies or Lixivial ones of their ashes; but volatile salts, and those which contain the whole Crasis or constitutive temperature of the Simples: For they are famous Diaphoreticks, and somewhat temperate ones: The which if they are drunk in Wine, or Vinegar at a due station, to wit, upon a fasting stomach: and before the fit of intermitting Fevers, or at any time of continual Fevers, and sweat be procured, they shall never expose a faithful Physician to a mock.

Cease thou also to wonder, that I propose Fevers to be cured without all evacuation, if I perswade transpiration, and sweats: For I have also seen Fevers to be frequently cured by Simples bound on the body, with the great disgrace of Physicians.

Lastly, I will also say this, that I have safely cured an hundred Quartanes by an Emplaster, without a Relapse, although Autumnal ones.

Therefore in the Family of feverish Species's, such particular remedies do oft-times reach to the top of an universal remedy. Seek and ye shall find, so that Medicine be not for gain: For if your intention be Mercy, from Charity; Truth, and Light descending from the Father of Lights shall meet you in the journey: To whom be a rendering of Honour for ever.

CHAP. XV.

An Answer unto Reproaches.

1. An Argument against the Contemners of Sciences.
2. Answers unto the Reproaches of the Galenists.
3. The Chymical Medicines of the shops are adulterated.
4. Corrosives wax mild by the fire.
5. An Objection concerning the smaleness of the Dose.
6. The dignity of Mercury, and Stibium or Antimony.
7. A most rare Arcanum of Volatile Salt.
8. All things cry for revenge against the Galenist, the Despiser of Chymistry.
9. The Original of the Apothecaries shop.
10. An Objection concerning the solving of Pearls and Coralls.
11. After what manner things dissolving are separated from things dissolved in the stomach.
12. What to [Precipitate] may signifie in Chymical preparations.
13. A censure of some writers of Chymistry.
14. A repeated Objection, privy escapes unto the more soft Tophus's or small stones of living Creatures.
15. Of what sort the action of Gemms on us may be.
16. What there may be in a more tender stone which operates, its powder remaining safe.
17. Mechanical proofs.
18. Proofs from their own weapons.
19. A certain wonderful, and almost infinite re-acting of the Patient without a transchangeative passion of its Essence.
20. An explaining it by handicraft operation.
21. What Bodies being apparently dissolved, may suffer in us.
22. A danger unknown to the Schools.
23. A Secret involved first by ungrateful dissolved bodies, and afterwards a superlative one by grateful Dissolvents.
24. A general kind of Medicine.
25. A conclusion unto Physitians.
26. The praise of the volatile salt of Tartar.

This ulcerous or corrupt age of most perverse Wits, will not suffer those that are admonished to repent: For so far are they as yet from that, that most Practitioners refuse to enquire into these greater Secrets, because they every where inveigh against Sciences which they are ignorant of.

But because they are altogether ignorant of the same, they both almost triumph, and also gratifie each other concerning their ignorance; neither is it manifest, that they have spent their time in those things unprofitably, because it shameth them not; to have a vile esteem of Chymical Science, by Writings and Taunts, as a smoak-selling, and delusive or false Art: But they know not, that since of a Non-being there is no knowledge, and no conception in the mind answering thereunto:

Therefore also, in that whereby they deny the truth of science, they manifest that they are ignorant of the same: that is, vilely to esteem of that which they are wholly ignorant of: And there are others, who more mildly, but alike blockishly say:

1. Those things belong not to our judgment or employment, they no way touch at medicinal affaires: for we follow things approved from of old.

2. Chymical medicines cast a smel of corruption, being hot, violent, and not common.

3. We have Servants who faithfully prepare those medicines which are for use: And it is unseemly for a learned man to exercise the composition or preparation of medicine.

4. The smoak-selling Experimentators institute all horrid evacuations, being full of terrour, because they are supported only by Mercury, and Antimony; they being manifest poysons: And so, they are to be reputed among Mountebanks or Juglers.

These are those things which they by reason of their ignorance, thrust upon the unwary

vulgar: whereunto I in order thus give satisfaction. We treat of medicines, but not of things, which concern a coriari, or potter: They therefore suppose a shamefull evasion, that they are ignorant of what it had behoved them to learn: Neither also is there a trusty foundation from antiquity, it being always ruinous; they going where it hath been gone, not where they were to go, they alwayes following the flock of predecessours, and mutually subscribing to each other through the blind judgments of their mind: our fugitive servants also will answer, I being silent, from whom they borrow the corrosive powder of Precipitate, and of another more sweet, or lesse poysonsome, and likewise the *vitrum* or glasse of *Antimony*, and the floures thereof, *Cinabrium*, and in summe; nothing but poysons, for the transplantings, and cloakings of great diseases: But all things notably adulterated for the desire of gain.

- 3 For it is easie to deceive the ignorant in things which they professe themselves to be ignorant of: For there are essential oyles set to sale, and the which are valued at a great price, they being all and every of them adulterated: whether nine parts of oyle of Almonds were co-mixed with one part of essential oyle, is a matter of easie experiment: For cast it on a sponesfull of *Aqua vita*, and whatsoever shall swim atop, let it be the essential oyle; but the rest, oyle of Almonds: And that thing thou shalt the more certainly know, if thou shalt make tryal in a Bath: The oyle of Sulphur is for one half of it raine water, but the distillation of Vitriol is brought wholly into deceit, and is more frivolous dayly: The which will presently be manifest through a simple examination by a Bath: That scarce a sixth part thereof is the pure distillation, and that as yet loaded with the tincture of oaken bark.

In the next place, unto the second particular I will by and by answer: Now it is sufficient to have said, *that the more choice Physicians at this day, do not despise Chymical remedies, the which, their bookes do lately testifie*: And so the Fox dispraiseth Grapes, and Hens, that are sequestred from him in the Tree: But how much they can performe, the experienced sick do speak though we be silent.

Unto the third: It is no disgrace or uncomelineffe, to have prepared some the more choice remedies with ones own hand, and to have bequeathed and delivered those medicines unto his posterity, by his hands: For neither was it an unbecoming thing for the High Priest of the Hebrewes to have struck down Oxen, and to have played the butcher for the salvation of the people: Is it happily a more glorious thing for the Galenical rout to have viewed stinking dung, and to have stirred it with a stick, than for us to have handled Furnaces, vessells, and coales? surely if they had the weight of truth, they would know that the works of charity do not defame any one: But they who have not charity, account all things disgracefull besides gaine and Lucre. Depart ye from this pride, and be ye mercifull, as your Father which is in heaven is mercifull: For else he will say, I know you not that live for gaine and deceite: But indeed disgrace hinders not these somewhat ambitious ones, but ignorance, and the covetous desire of Lucre: For they make more account of the number of visits, than of the glory of curing, which wholly buries it self in having done well.

For as soon as they are dismissed from the Schooles with the title of Doctour, they enquire through the Streets and Inns, with the eyes of a *Lamprey*, whether there are not sick folks which may entrust them with their life: But stop your proceedings, Medicine is not to be exercised after the manner of Mechanick arts.

And because Physicians err in this point, the Father of Lights withdrawes his gifts, after that Medicine is managed as a Plow. Possess ye Charity, and gain Will voluntarily, follow you with Honour and Glory, the which take hold of a Physician that shuns them, whom the most High hath commanded to be honoured.

- 4 Unto the fourth I grant, that all kind of Knaves have most licentiously thrust themselves into Chymistry, no less than into Medicinal Affairs, and that a various destruction doth thereby daily arise unto mankind; on whom surely the Magistrate ought of right to be severe in punishment: But these things do not defame honest men. It is certain, that deceit, and the adulterating of Medicines have always been annexed to gain. But as to what pertains to the reproach of Remedies, & Chymists, that is to be sifted by a larger Discourse.

First of all, it is suitable in this place, That Science or Knowledge hath no enemy but the ignorant person; Not any such one, but him that is proud, and refuseth to learn: The which is manifest by the already mentioned Corrosives, and indeed manifest poysons, that they become sweeter than Sugar: The same thing is also more easily manifest, and to our hand; For truly Scarwort, Frogwort, *Apium risus*, &c. do forthwith in distilling lay aside their embladderring power, even as the juyce of Citron doth its sharpness,

hells, Water-Pepper its Acrimony, &c. Neither is that of concernment, that Chymical Medicines are to be administered in a small Dose : For that accuseth them not of poysonfomness, but of the highest perfection of acting : For so there is one dose of meates, and another of *Scammony*, *Spurge*, and *Coloquintida* : Therefore an undiscree Physician is like a Tormenter.

The virtues of a Chymical remedy are narrowed in a smal quantity, under which they are pleasing while as all things have regard in their own proportions, unto the strength and necessities of the sick.

Hitherto perhaps that saying of *Jeremy* 15. doth not unfitly square : *If thou shalt separe the pretious from the vile, thou shalt be as my mouth* : But that which they upbraid us with concerning *Quicksilver*, and *Antimony*, it contains a meer ignorance of things, and a blockish reproach : For *Antimony*, as long as it provoketh vomire and stooles, and *Mercury* may be revived, they are poysons, nor the remedies of a good man : But when they have come unto the top of perfection for which they are ordained of God, no mortal man can search out their virtues, or illustrate them with due praises, however the guts of the scoffing *Momus* may crack.

For neither do we boast, that we have known the purgative force of *Mercury*, and *Stribium*, and to have given them to the sick to drink, who detest purging things, especially those which alike equally dissolve an healthy, as a sick person, by causing putrefaction. Lay aside *Choler*, and remember that in your shops, dispensatories Echo forth nothing besides *Scammony*, *Coloquintida*, *Elaterium*, *Esula* or spurge, that is, meer poysons : And then, although the essences of vegetables and spices are hot ; yet their volatile salts (which thou hast never seen) are temperate.

So that, if thou shalt know how to transchange the oyle of *Cinnamon*, *Cloves*, *Lavender*, &c. into a volatile salt, thou hast obtained a temperate medicine effecting as much as can be hoped for from those simples, in an old Vertigo, Beating of the heart, Apoplexy, and the like diseases : Therefore they who at this day keep the keyes of medicine, seeing themselves do not enter the passages, they drive mortals from the usefull fruite of those gifts which the most high hath dispersed in nature.

Therefore the powers of the most excellent things cry to heaven ; that they have come as it were in vain, that there is scarce any one who can loosen their bonds, that they may bestow the benevolence which is due to mortal men ; but rather, that they have become the rewards of whoredomes and adulteries : That science therefore which teacheth how to look into bodies shut up, by a re-solution of themselves, and to extract their hidden virtues, is not the servant of the practick preparatory part of medicine (as the reproaches of the ignorant do sound) but it is the chief interpretation of the history of nature.

For the Apothecaries shop began at first, from Merchants, the collectors of simples and herbs : but afterwards when Physicians saw that it was not meet for every one to boyle, season, and prepare simples, that buisnesse was also comitted to the sellers of simples.

In the mean time, Physicians kept the more choyce and secret remedies to themselves, whereby they might procure honour with their posterity : But at length the sluggishness of Physicians increasing, they were contented to run through the streets from house to house, to have made gain by the frequency of visits ; at length Dispensatories succeeded thereupon, for the compiling of formes of medicines here and there selected according to the pleasure of ignorance, that they might be kept in the shops, and in a bravery set to sale, rather for expedition than for their property. Whence at length, Physicians joyning compositions to compositions, give sometimes the hotch-potch of a thousand simples to the sick, to drink, that if one thing help not, at least wise another may help ; or at least, that they may excuse themselves that they have managed the cure of the sick according to the common rule. This is the preparation of medicine at this day, from which, how far the Philosophy of Chymistry differs, they indeed have known, who even but from the entrance, have saluted the same ; but unskilfull haters only, are ignorant thereof.

The Galenists surely will take it haynously, that I have answered unto their ignominies and reproaches by meer light, and that I have rent the Household-stuffe of their chiefest remedies, wherefore they will pursue (I know well enough) after this manner : Thou urgest that *Pearles*, *Corrals*, &c. Are not dissolved in sharpe liquors ; but that they are only calcined, and powdered by the salts of the dissolvers, also that they are hidden, and made invisible onely to the sight : And that thing thou provest by *Silver* being dissolved

solved in *Aqua fortis*, that it is from thence reduced safe, therefore that it hath not lost its former essence, and thou wrestest that aside unto the aforesaid Stones, and provest it, because by the *Alkali* salt of *Tartar*, the same stone is again precipitated to the bottom, which before was an invisible powder, as the *Alkali* salt drinks up the sharp or sour salt which contained the powder of the stones in it self: But thou seest not, that first of all your young Beginnings do teach, and greatly esteem of these sort of dissolutions: Then also, that the stomach wants the salt of *Tartar*, that it may precipitate the dissolved powders, and separate them from their dissolvent, and therefore thou proposest a mockery; and by consequence, the matter of Pearls, Corals, &c. being once after this manner dissolved, remains dissolved, and is admitted inwardly unto the veins, with the liquors of the Cream, and so is transchanged into urine, or blood, and performs as much as we promise.

I answer, *That Nature hath no need of the salt of Tartar, to separate that powder from its dissolver*: Because she is well instructed, as well in respect of the meats, as of a proper digestion, to sequester this powder. For there are very many things among meats which produce this effect; such as are pot-herbs, and likewise vulnerary herbs, &c. wherein there is for the most part, a volatile lixivial salt: And also wines with the white of eggs, do not only separate such coagulated dissolvents from the powders dissolved; but they do also revive precipitated Mercury.

Again, the very digestion of the stomach it self doth ordinarily, substantially transchange the sharp spirits of vegetables, into the salt and volatile salt of urine; the which when it hath no longer the former faculties of dissolving, which it at first had in its sharpness, it presently utterly leaves (that is precipitates) a powder, which before it hid as dissolved in its own sharpness; and therefore it precipitates or thrusts down, and puts off from it the aforesaid powder, before the doors of the miser aick veins. And so, let the *Galenists* know, that the writers of the young Beginnings of Chymistry are as yet young beginners; they triumph, that they propose to others what they have tasted down with the tip of their lips; and so they have not yet had access unto the inner Chambers of Philosophy.

But again, the *Galenists* will urge, saying, that the stones of Bezoar, Crabs, Snails, &c. being taken as well by way of a powder, as being dissolved in a sharp dissolving liquor, do notably profit in the Plague, Fevers, the disease of the Stone, wounded persons, and in those that are thrown down from an high place: wherefore that the same thing is blockishly denied by me in Pearls, Corals, &c. whereto I answer; *That gems, small or stony stones, and rockie stones, have much latitude, and that they differ very much among themselves.*

For first of all, Gems, Flints, Marbles, and whatsoever things have a Christalline hardness, do not any thing act, or suffer on us, or from us, unless by way of a remedy hung on, and bound about the body, and that so long, as from the mouth they pass thorow the superfluities of the Body: The virtue therefore of these is feeble, because it layes hid, as being shut up in a too thick body: But Pearls and Corals, and whatsoever stones have the rocky hardness of Shell-fishes, do indeed yield to Gems in hardness, yet they are not therefore concocted in the stomach of man, as they are well, in some birds: But the stones of Bezoar, Crabs, &c. being as yet less hard then Pearls, are not of a rocky nature, but they are made rather of a milky juice, half cheesed, and half stonified, and they have the nature of a *Tophus* or sandy stone, being neutral between a gristle and a stone; even as the shells of stones in medlars, peaches, &c. do keep a neutral and middle kind between woods, and a sandy stone.

These things being for the truth of the matter, and the better understanding thereof, thus supposed, I say, *That although the stone of Bezoar, of Crabs, &c. as to the solide matter of their powder, are in no wise digested by mans Stomach; yet there is in them a certain milkie and muscilaginous juice of great virtue, yet of small quantity*: Such as also happens to be extracted out of the shaving of Harts-horn, by seething.

If therefore thou dost a good while boil the powder of the aforesaid stones in rain, or distilled water, if thou separatest the decoction from the powder by straining it through a Filter, but dost in distilling this decoction by a bath, draw it forth, thou shalt at length find some small quantity of the aforesaid Muscilage: But the remaining powder as it is unconquered by boyling, so also it remains undigested by our stomach: And so from the small quantity of the aforesaid liquor there dependeth a reason why one only dram of that stone being powdered, and taken in some liquor, effecteth more then otherwise one scruple of the same doth: when as in the mean time, the Wine, or Vinegar being drunk up at the same draught with the aforesaid powders, do not dissolve the sixth part of the powder; but the rest they forsake entire,

fire, not changed; which is manifest, if thou shalt drink the stone of crabs, being not beaten into powder, but into pieces, and after voiding them forth, shalt wash them clean, thou shalt find the same weight thereof which there was before, and so nothing thereof to be subdued by the stomach, nor any thing of those stones to be participated of by the digestion.

Come on then, I will also press the Galenists with their own weapon: for if the aforesaid Stones, or Pearls being taken by way of a powder, should melt in us, ye attempt in vain to dissolve them: Therefore it is already manifest by handicraft operation, that the more tender Stones of living creatures do contain a Muscilage, which Pearls, Corals, and rocky Stones do want: yet the bodies of somethings remaining in their powder, and homogeneous and unseparable solidity, as they suffer in their dissolution an action from the dissolver; so also, in like manner, the dissolver suffers by the body dissolved, without any participation in the mean time, of the unchangeable body: for from the Chymical Maxim, *The dissolvent is by the same endeavour coagulated, whereby the body dissolved is dissolved*: And therefore if the body dissolving be taken away from the body dissolved, nothing is ordinarily recovered from thence, besides a water without savour, being without acrimony and sharpness: the which surely as they are the Clients of Salts, they are coagulated in the thing dissolved, and stand by it as Companions. Thou shalt know the same thing more clearly, if thou distillst the Oyl of Vitriol from running Mercury, the Oyl is coagulated with the Mercury, and they both remain in the bottom, in the form of snow: And whatsoever is distilled from thence, is meer water: but that snow, if it be washed, is made a citron coloured powder, which is easily reduced into the former running Mercury, being altogether of the same weight as it was before: but if, thou shalt distil the water of the washing off, thou hast in the bottom a meer Alum, from the sharp salt of Vitriol. For so dissolvents are changed, although the bodies dissolved have not lost any thing of their own matter, or substance: And such dissolvers act on us, by way of an alteration attained in their own sufferingness; but not from a property partaked of from the dissolved bodies being unchanged: Therefore to the argument proposed.

The salts of vinegar, wine, juice of Lemons, or of the Oak, and likewise of the sharp chyle of the stomach, as they are vegetables, and alterable by our digestion, by digesting indeed are changed in us, into a urinary salt; notwithstanding, by reason of the diversity of the thing dissolved, those dissolutives suffer something from the aptness of their own convertibility; yet they transfer not any thing on us of the thing dissolved that is not digestible, unless it contain the digestible part of it self; even as I have said concerning the milky muscilage of the stones of soulified creatures: But if indeed otherwise, such a dissolved body should proceed inwards into the veins (which it never doth) that it might communicate its endowments unto us (to wit, pearls, or the aforesaid stones) very many anguishes would follow from thence, instead of succours.

For first, since they are not digested in the stomach (even as I have already proved), neither in the next place, shall they be able to be cocted in the second digestion; because there is no passage unto the second, but through the first.

Secondly, Therefore they shall never be converted into blood, but into some other superfluity of the veins.

Thirdly, powders shall be bred in the veins, and kidneys, and they shall be stopped up with the powder being a foreign guest, never to be drawn out by any remedy for the future.

These things are spoken concerning things dissolved by a dissolving vegetable, and therefore digestible in us. Notwithstanding, if things are dissolved by dissolvers that are not digestible, those shall either be ungrateful to the nature of the stomach; and therefore they stir up vomit and stools: So that only the incongruity, malignity, and ingratitude of things taken into the body, are the cause why they move vomiting and stool, and are forthwith expelled with those things which they threw down into their own Faction: Therefore they procure perplexities and troubles. But if the things dissolving are acceptable to Nature, they are willingly admitted inwards; yet the composed body suffers not any thing thereby, as well in respect of the thing dissolving, as of that which is dissolved: For truly, both of them are undigestible: Therefore that composure remains safe as before, it passeth through all the shops of the veins, and at length (for truly, it cannot be changed; nor by consequence, pass over into the Family of Life) is expelled with the sweat, by transpiration.

In which journey, whatsoever of filths those famous Secrets do touch at, they dissolve them, and snatch them away with themselves, and so they heal Fevers, and most Chroni-

26 cal diseases. Whosoever therefore ye be, who in healing, have cordial charity towards your neighbour, learn ye a certain Dissolver, which may be homogeneous or simple in kind, unchangeable, dissolving its Objects into their first liquid matter; and thou shalt obtain the innermost Essences of things, and shalt be able to look into the natural endowments of these.

25 But if ye cannot reach unto that Secret of the Fire, learn ye at leastwise to render the Salt of *Tartar* volatile, that by means hereof ye may perfect your dissolutions: The which although as being digested in us, it forsaketh its dissolved bodies that are safely or unharmedly homogeneous; yet it hath borrowed some of their virtues which it conveys inward as the subduers of most diseases: But for the obtainment of these things, it is not sufficient to rub over Books; but moreover it behooves you to buy coals and vessels, and to spend watching nights in order: So have I done, thus have I spoken, let the praise be unto God.

Because the Universities in their eighth Potion forbid, to wit the *Cutting* of a vein, except in the fulness of blood, but they admit of it only in this, because then the vice of Blood-letting cannot be sufficiently manifest, and because in their tenth Position, they now implicitly grant a Fever not to be a meer heat, but that it is to be cured by heating, and corroborating remedies, they being all hot things: Surely one of the two must of necessity be true; To wit, either that a Fever is not heat in its root; or that they must not heal by contraries any longer.

Out of the Positions of *Lovaine*, disputed at *Lovaine*, under the most discreet Sir D. *Vopiscus Fortunatus Plempius*, on the 26. of *November*, in the year 1641.

CHAP. XVI.

The Essence of Fevers is discovered.

1. The life of Mortals is the efficient cause of Diseases.
2. Herein is the raging Error of the life.
3. A proof of the foregoing particulars.
4. The Author, wherein he disagreeeth from the Antients.
5. The internal efficient, and its matter are proved.
6. In what sort the Thingliness or Essence of Fevers may be formed.
7. A Proposition.
8. That Immortality once consisted from a natural cause.
9. The Original of disease Idea's.
10. What hath deceived the Antients.
11. That the Archeus in his own Idea's of perturbations, imitates the Imagination.
12. The aforesaid Proposition is proved.
13. A two-fold fountain of the Beginning of Idea's.
14. A necessity of Idea's in a Fever is proved.
15. The same thing by a numbring up of parts.
16. An examination of the occasional cause.

Hitherto I have disputed against the Schools, as if I dared not to teach the Essence of Fevers: Therefore since the fruit discovers its tree, I am compelled for the sake of the Lovers of Medicine, to add a supply, whereby the Essence of Fevers being hitherto unknown, may be the more illustrated, and a manner of distinguishing between Judgement and Judgement, and Remedy from Remedy, may be granted to the young Beginner.

First of all, I have shewn ably enough, that the definition of Fevers have been hitherto unknown, and therefore that the Essence, and essential causes of those are as yet unknown: And seeing the knowledge of things is not granted unto us from a former cause; at leastwise it is strongly to be admired at, that nothing hath been devised for the Essence of a Fever, besides heat; while as notwithstanding, the History it self of Fevers might have been able sufficiently to have opened the Necessities, Agreement, and Constancy of Causes: and at leastwise to have reduced Mortals from the ridiculous error of heat, unless a sluggishness it self of Mortals had been allured through the tediousness of a diligent search, and the easiness of subscribing.

First

First of all, I speak of the nature of man being corrupted, such as it continues since transgression successively.

For a Disease was as yet an Exile, as long as death was absent; So indeed that a disease had not yet any hope for it self in possibility: But after that death entered into the life, every disease stood in a powerful army directed against the life it self: so as that a disease intended to establish its nest in the vital Beginning; not indeed by fighting as a certain external thing on and against the life: But the foreign Guest drew his sword in the very life it self, whereby he might cut off the Life, his Inne, and the Patron of his Essence: For such was the corruption of mans immortality, that he afterwards drew his own death out of the life it self: For neither do I speak in jest; far be it, when I write of preserving the life of Mortals.

For indeed every Disease perisheth presently together with the life: For neither do matters however hostile they may be feigned to be, combat, or wax hot any longer after death: Wherefore every direction of the internal efficient cause ought to depend on the life it self: For that which the Ancients have even hitherto before me called the *Duel of nature*, also the lot of an *Elementary complexion with solitary qualities*, or with the very offensive matter of supposed humours among each other: All that I affirm to proceed effectually, efficiently, and immediately from the principle of life; that is, from the inordinacy, indignation, tumult, terrour, and abhorrency of the vital spirits.

But the excrementous matter, and that which they have thought to be, and called the offending or disease matter, I call that which is produced, detained, or introduced besides nature from an erring, or foreign occasional cause: And so I call all such matter only the *occasional matter*: indeed the inciting one, and plainly external to a Disease; because the presence of which matter as yet remaining, the whole Fever doth oft-times cease, and utterly perisheth: Therefore the internal, efficient, and immediate formal Being is the very life it self; and the immediate matter thereof is drawn, and departs from the vital air as to a part of it, wherein the life it self is entertained, and sits: and so it hath an immediate, and plenipotentary power on the life, which is con-nexed unto it in the resembling mark of uniformity; for otherwise it should be an inconvenient thing for the mad or raging life of a Fever to bring forth a disease, or to conceive, effect, and nourish a formal, and essential Beginning, foundation, and seed out of it self: For the life is not able to establish a disease which is a seminal Being, in the foreign, and external subject of excrements: For if the life ought to suffer by a disease, to be vexed, and killed thereby, surely it being now defiled, ought to suffer all the injury from its own self; according to the Proverb, *None is hurt, but from himself*.

Hippocrates in times past after a rustical manner perceived that thing, the first called that vital spirit; *The maker of the Assault*, as well for life as for death: For God made not death for man, the which began from sin.

But I do not deny that the life is provoked into its own injury by occasional causes: yet at leastwise I could wish, that the Ancients had divided, as is meet to be, the internal cause essentially from the external occasional ones: But I take not the internal and external matter for a respect of the body; but that which is radically, and essentially proper to the disease, that I call the *Internal, and unseparable matter*: But otherwise, if it be only accidentally adjacent thereunto.

Therefore before all, it is seriously, and only to be noted, in what manner the very essential thingliness of Fevers may be formed by the Essence of the efficient life: That not only the very local thingliness of principiating a Disease may be hereby conceived; but that moreover an essential limitation thereof essentially issuing from the life it self, may be known: Which things therefore are more deeply to be peirced.

Wherefore let it be instead of a Proposition; that Mortality, Death, and a Disease, seeing they entered with sin, they corrupted the life, and defiled the whole humanity with impurity: Not indeed that the entrance of all particular Fevers is therefore from a new sin, as neither immediately from original sin, although they have originally defluxed from thence.

But in the state of Purity there was Immortality, no Death, no Disease, because then the immortal mind immediately governed the body, and therefore it suffered not any thing by frail things which are altogether inferiour to it self: therefore it deservedly freed its own Mansion united unto it self from death, and corruption: But after the departure out of the right way, the mind delivered up its government to the sensitive soul, whence the life became subject to a thousand inconvenient necessities of death.

The Sensitive soul therefore afterwards stirred up the Vital air, which after that,

began to be called by *Hippocrates* Τὸ ἔντονον, or the *Maker of the Assault*, and the chief Work-man of Diseases: But the power of the same was badly understood by his followers; and that Maker of the Assault remained neglected by Successors, it being also unknown that the differences of diseases did issue immediately from the life; And therefore the whole business of Diseases was falsely committed unto occasional, and never existing Humours; For I have concerning the Original and Principles of Healing, delivered the manner whereby that Maker of the Assault produceth an Ideal Being: from whence Fevers, and all Diseases borrow their Original: The which generation of Ideas or shapie likenesses being there professly handled, I will only touch at by the way.

- 9 First therefore it is confessed, that the madness of a dog is stirred up by or in his conception through the effective Idea of that mad poyson: The which is not in any healthy dog, even as in a mad one. And from thence it is manifest, that that poyson (which strikes our imagination after the biting) is framed by an Idea caused by the conception of the mad dog.

The same thing proffers it self in the *Taramula*, in Serpents, and things fore moved with fury: So in the Plague-grave I have demonstrated, that this Idea is made not only by the fear of the man, but also of the vital air: Wherefore also it is very equally necessary, that for a Fever (which is stirred up from the assaulting spirit, and vital Beginning, not which ariseth, is moved, or increaseth of its own accord, or of nothing) a motive Idea, or effective cause springs up in the same vital Beginning, being indeed poysonsome in it self, and varying according to the signatures or impressions which this tree of a feverish Idea utters for its fruits: For since of nothing, nothing is made; but of something, alwayes something: As well the Antients as the Moderns have supposed, that any Fevers whatsoever do of necessity arise from the strife of the Elements, or at least of feigned Humours: Neither have they till now clearly defined of which of these two the texture of Fevers might be.

But since the Elements are but three in number, neither do these flow together unto the constitution of bodies (because I shall elsewhere shew the connexion of these to be impossible) they cannot produce any strange Beginning from themselves: But Humours since they never have hitherto any where been, and since Fevers are of a more airy, and abstracted body than that which a liquid excrement is thought to be: I have discerned that from nothing, nothing is indeed materially made, but that most things are efficiently effectively, and formally made from a conceived Idea, which do forthwith after cloath themselves with bodies.

Indeed by the conception active Ideas are made, and the formal Beginnings of seeds, which presently cloath themselves with the coat of the vital spirit, wherewith they then in the next place come upon the stage, and are made that Maker of the Assault, which is known by the Schools only by its name alone, and therefore neglected by practical Physitians: For that Fevers do now and then arise from the disturbances of the mind, that is very well known to persons of no reputation, and Barbers.

- 11 But that the *Archeus* or the spirit which violently assaileth, doth suffer its own perturbations, and conceive the Off-springs of these, the Ideas stirred up in it self, hath indeed been even hitherto unthought of, and unheard of in the Schools: Notwithstanding, nothing is more certaine, than that the spittle of a mad dog doth a good while after the death of the dog, produce its madness in whom he bit, it being plainly very like to its own dog from whence it issued. Wherefore there was in the spittle a forming seminal Idea of that madness produced, being like unto that from whence the first infection flowed: For such an infection presupposeth an active, vital, and potent propagative power of its seed, because it can cause death, and madness in us: But that power never ariseth as a naked accident, but as it inhabites in a formal subject of infection: Neither also that the visible matter, or Inn of its inherency is the very same power, nor the exciter or spur of its own self, or that that power subsisteth alone without a root which stirred it up; But every power hath a nourishing, causing, and directing Being of it self, far more spiritual, and abstracted than is the Case of its inherency: More abstracted I say, than is the mean it self whereinto the motive power is received; yea more formal than the very quality of the power it self is.

Truly there is a master-work man-like image of evil, or good, the Effecters of effects, as well in diseases, as in other seminal Beings: But that image takes its Original beginning from the cogitation of man, or from the conception of the Archeal spirit surrogated

gated in its absence: (I now speak of Diseases) For the Sensitive Soul is in the spirit or Archeal air, after the manner of the Receiver: And although the Archeus be not vexed after the usual, and humane manner of the soul; yet the Inn of the sensitive soul (which is the Archeus himself) arising, enjoys the Idea's as well from his own conceptions, as from the exorbitances of his conceptions, after the manner proper to his receiving.

For neither doth the Archeus alwayes fish those passions out of his own conception, but also from things undigested, badly digested, and transchanged: Even so also from excrements not being rightly subdued, or separated: And so also, not only from our faculties being estranged, or erting, but besides, from the in-bred endowment of things; Even as in the spittle of a mad dog there is a poysonous Ideal property which alienates the imaginations of the sensitive soul in us at its own pleasure: There is therefore in things a certain accidental power, which if it can perfect its own contagion, and propagation, it wants a formal, and seminal power which may be the Governess of the action: For seeds, as they utter the figure and similitude of themselves in their products, of necessity, they have this Image engraven on them, if they ought to act out of themselves, or to erect another thing like to themselves in the thing produced; seeing such a likeness presupposeth a forming Idea.

In the next place, the occasional matter of Fevers, if it were of the essence of Fevers, or if it should not precede; at leastwise it should alwayes accompany the proper effect to it self.

Wherefore since a quaternary of Humours, and the existence of these are feigned, things; it must needs be that the feigned humoural cause doth neither fore-exist, nor follow the Essence of a Fever, neither that there is any respect of Humours unto a Fever, nor likewise of a Fever unto feigned Humours.

Again, neither can the blood (the treasure of life) after any manner be the constitutive cause of Fevers; yea nor indeed the occasional cause thereof, except it be hunted out of the veins; and first corrupted; that is, unless it first cease to be blood: For truly there is no other reflexion of the out-chased blood, than that it is a dead Carcase in a living sheath, & that in the mean time, it undergoes divers transmutations according to the variety of the Idea of the Archeus, governour of the stern of the family-administration in the nearest kitchens: For this vitiated blood is now a cadaverous excrement, and an occasional cause, whereby the Archeus being excited, frames an Idea of fury.

Lastly, any other excrement whatsoever being defiled by a succeeding digestion, transfers the right of an occasional cause it self, and occasionally brings forth a Fever, no otherwise than as I have already said concerning the blood: And such an excrement is heaped up by a vice, digestively, and distributively, or by degrees, or at length is produced by a Fever, or by foreign things breathed into the body: However it shall be, at leastwise in respect of Fevers, it alwayes remains external; neither doth it ever enter into the Essence hereof: They are indeed only accidental considerations which do most nearly respect the degree of Fevers: for if the action of diseases proceedeth immediately into the life, and takes its beginning from the life; verily it is necessary that the essence of diseases do also wholly pierce the very essential marrow of life; But other external things of what sort, and how great soever, do only regard whether the occasional matter be greater or less in quantity; Whether the efficient cause in a young man be stronger than in an old man, in the beginning of the disease than in the end thereof, in a malignant Fever than in a more mild one, &c. But such degrees of powers are only the Correlatives of the efficient, being compared unto the strength.

And they teach indeed, how much it is to be feared from an accident occasionally rushing on the sick: But I here have regard unto the formal essence of a Fever: Therefore the essential power of the internal efficient, or of the life it self, is alway present, and remaineth; and the denomination thereof drawn from a term of Relation, although it may change the hope of the Physician, may vary the superiority of life, and the proportion of the Agent; yet the life it self is alwayes the intimate, principal, formal, and essential efficient of Fevers, and the occasional matter every where remains without the true, and internal material cause: For a Fever is oft-times taken away, or ceaseth, a remnant of its occasional matter, and efficient as yet remaining: For a Quartane oftentimes ceaseth of its own accord, and perhaps returns again a month after; and so it keeps its occasional matter in the mean time untouched, and without action, as it were sleeping: And the same occasional Being is elsewhere of its own accord wholly consumed

the forme of the Archeus being first appeased: Oft-times also, Fevers leave weaknesses, and local diminishments of the faculties behind them, being durable for life: as the life of the implanted Archeus was curtailed, and suffered his own too many tribulations.

CHAP. XVII.

A narrow search into the Essential thinglinesse of a Fever.

1. *An erroneous speculation of the Schooles.* 2. *The Authour differs from the Schooles.*
3. *The manner of making a Fever is enlarged for betokenings.* 4. *The center of a Fever.* 5. *An examination of thirst, and cold.* 6. *The Doctrine of its center is confirmed.* 7. *Why a Fever is sometimes terminated by the appetite of unwonted things.* 8. *The family government of a Fever in the Pylorus.* 9. *The Quartane ague is an outlaw; and the unheard of seat of strange Fevers.* 10. *Why Vomiting looseth not these strange Fevers.* 11. *The definition of a Fever is rent.*
12. *An examination of remedies.* 13. *The vanity of hope, from whence it is introduced.*

Hitherto as well the modern, as more ancient Physicians have considered the nature and essential thinglinesse of Fevers, from the speculation of heat, as well internal, as that of the encompassing heat of Summer: And also they have measured that essence by the sharpnesse, cruelty, multiplicity of the occasional matter, or from the malignity of one, or more of the four feigned humours: For so they have shut up the gate before their own judgments, whereby they ought to have entred: For truly the manner of making in Fevers, and its internal efficient, and seminal matter, have remained neglected; they have contemplated of a Fever only in its being made; and so, thus they have withdrawn from themselves the knowledge of its essence; whereas otherwise, the manner of making above distinguished, uncloathes the internal thinglinesse of a Fever, which the Fever that is made includeth, the understanding of man not being able to pierce things by its own power, which it hath on purpose shut up from it self.

I have therefore taught above, from what active and vital beginning a Fever ariseth feminally, and materially in us; that is, entirely: For the essential thinglinesse of Fevers being perfectly taught by their manner of making, makes manifest the thinglinesse of the efficient whereby it is formed: Because it begs all its determination from the life.

- 2 For therefore the true Ental and essential thinglinesse differs in the whole circumference from the Antients their supposed thinglinesse (to wit, the accidental one) of Fevers: For the accidental Being it self (which is the very supposed Fever of the Antients) differs in the whole predicament from the substantial and vital Being of Fevers, and from their seminal Beginning, progresse, co-fitting, action, sequestration, defilement, and immediate property, being drawn, to wit, as well from the motherly part of the internal and vital matter, as from the fatherly part; to wit, from the thinglinesse of the vital efficient principle.

For truly Physicians hitherto, place every disease among naked qualities: But I have demonstrated, that heat is not the essence, or of the essence of Fevers; but a meer accident, seperable from a Fever, and that which is accidentally, and by intervals adjacent to a Fever.

- 3 Now it remaines for the knowledge of a Fever, and its remedies, to contemplate of the manner of its making, while it is in making that the tree may be bewrayed by its fruites: There-

Therefore almost every Fever, presently after its beginning, abhors and is averse to flesh, fishes, meat-broths, eggs, and whatsoever things may soon be corrupted within the stomach: For flesh and fishes only by a lukewarmth do voluntarily depart into corruptions proper unto them, and would hasten stinks as it were to the bound of a dead carcase.

And these, when they slide down into a stomach that is deprived of its accustomed due and digesting ferment, do through the lukewarmth of that place alone, hasten into the corruption of themselves. For feverish belchings do from hence become of a strong savour, and therefore for soure belchings to happen upon burntish or stinking ones, Hippocrates will have it to portend a good Omen or presage; because that the digestive ferment of the stomach (which constrains all things to wax soure) testifies by soure belching, that it hath returned: The which otherwise, being absent, sleeping being hindered, or suppressed, flesh, and those things which are ready easily to putrify are presently corrupted: Whence afterwards yeellow, leeky, and bitter vomiting is stirred up, from the pottage of the Steward being corrupted: This is the cause why whatsoever things do easily putrify, are presently made hateful in Fevers.

But at least wise, from hence it is manifest, that the stomach is the stage of a Feverish combat: And then thirst presently gives its voice for this conception, accompanying most Fevers.

Yea and in the great, and dayly cold of intermitting Fevers, thirst is more cruel, and the vomiting of that yellow dreg more abundant, than otherwise, in the sharpest heates of continual Fevers: For neither therefore, must we make an escape unto the wonted hiding places, as if only the outward parts were cold, but that the inward bowells were hot, and did most mightily burn with heat: To wit, from whence, under cold, so great importunity of heat did molest: Far be it from being willing to impose by so manifest trifles, on the truth! For truly in the beginnings of intermitting Fevers, horrors and colds are felt, no lesse within than in the joynts: Therefore indeed the inward dens are shaken by reason of Cold, even so, that the teeth & joynts bewray nothing but inward cold.

But Feverish rigours are appeased as soon as the fury of the internal cold hath become milder: But that thirst is dectfull; Because it is that which not only drink doth not quench, and which doth miserably delude the drinker; but also it reacheth that it was not caused by a defect of moisture: But if a fervent heat within (otherwise worthy to be laughed at) be supposed to be, as long as it stirs up a cruel cold out of its inner chamber: At least wise, doth not that heat, the household guest of Fevers, (although it be not yet complaining, or hitherto felt) while it is dispersed, and the cold is driven away, doth it not I say get it self strength in going? And unfold it self? Not indeed after the manner of a substance extenuated by enlarging, but by acting after the manner of heat increasing: Even so as the hand being made cold by snow, if it recover heat, it waxeth hot more and more, and far more powerfully than that which is made hot by the fires side. Why therefore if thirst be made by inward heat, at least, is it not quenched by drink: Why also, heat being now increased, and by occasion of the Fever, enlarged unto its state, doth not thirst likewise increase; but rather is for the most part, mitigated?

Is it not manifest from hence, that thirst doth not spring from heat; but from a far different root? Especially, when as oft-times the sharp distillation of Sulphur, either quenches the thirst, or at leastwise, mightily allayes it. Therefore the sudden averiness of appetite, and abhorrency of meates, and a disdainfull choice of drinks in Fevers, a thirst almost unsatiable, vomiting, loathing, anguish, together with sighs, sometimes continual watching, lastly frequent drowsiness, or doating delusions, discover and accuse the stomach, and the neighbouring places thereof to be the place or sink of a Fever.

For therefore a slow and more stubborn Fever is frequently loosed by the appetite of unwonted things (to wit, of a herring and smoaked things) it hoping by such an unthought of matter, to subdue the guest its enemy: For such unwonted things do please, not indeed because they are fit for digestion, or nourishment (because it is that, which then is nothing in the same place:) but because they blot out the impressional Idea of the Archeus, and feverish seal, no otherwise than as after another manner, inordinate foods do occasionally stir up foreign, or silent Idea's of fits in the Archeus: For if a Fever had appointed its nest far from thence, all food ought also to be first transchanged in the stomach.

And therefore, by how much the farther it deviates from thence, by so much the more, the vigour of meates, and quality of their former life is prostrated: Wherefore

fore, if a Fever, otherwise of long continuance, be vanquished by the appetite, and enjoyment of that unaccustomed food; it denotes, that a Fever is not far remote from the member desiring it.

- 8 Indeed, elsewhere sours belching also, returns with an appetite: But at least wise it is manifest from the premises, that the veins of the stomach draw not unto the liver, as the meseraick veins do; but rather that they are designed for nourishing of the stomach: The which I have elsewhere, concerning digestions, diligently and advisedly explained: For truly oft-times, things that were taken for two days before are rejected by vomit, thirst not hindering it.

Therefore the Pylorus (the lower porter of the stomach) as long as the Fever bears command, doth not rightly performe his office; and the thirst which ariseth in that two dayes space, doth diverse times return, vex, and again wax mild: And the Pylorus knows not for what end he so stubbornly shuts himself, and so greatly detaineth that drink within the stomach, the sink of Fevers: Wherein then especially the goodnesse of digestion is not hoped for: but rather a long delay, and consequent corruption of that which was cast in: He knowes not I say, *to what end he utters so mad effects, while as from such detinements, he procreates yellow and bitter excrements, which hitherto have deluded the unwary with an image of the Gant, and that he dasheth forth those excrements abundantly, in vain, and without easement.* For from thence I conjecture, that the appetitive faculty of meates and drinckes implanted in the orifice or upper mouth of the stomach, hath declined into the Pylorus, all things being confusd above and beneath, and therefore that a mad thirst doth equally molest; because the Chaos of the feverish confusion is tossed immediately in the forreign fold of the Pylorus.

For neither is that thirst allayed by drink, which is not in its own place, to wit, in the orifice of the stomach, whose office alone it is to denounce the defects of nourishment.

A Fever therefore hath a poyson, and it is a manifold serpent, which is entertained about the Pylorus, and a little beneath it, or which sits in the hollow bought of the stomach: For there are oft-times ridiculous doatages, elsewhere also furious ones, according to the condition of that poyson: But that serpent oftentimes stirs up thirst, oft-times also anguishes, faintings, and soundings or frequent bitter vomitings, or also those that are impatient and unsufferable of nourishment alone; or continual watchings, and at another time drowfie evils supply the roome of these.

At leastwise at its first entrance, the ferment of the stomach, together with a desire of eating do presently faile: Neither therefore doth Anatomy vainly complain, that the difficulties of dissections next under the Pylorus, do exceed any other of the whole body, by reason of a multitude of vessels in-writhed with glandules.

For hence the exorbitances of the nourishment that is badly digested, and badly distributed, and likewise of the drosse or liquid dung, being alienated out of its circle, or the degeneration of the nourishable and spermatick humour, do concur or run together, whence the family-administration of the stomach is overthrown: For truly all of them concur in the manifold texture or weaving of those vessels, and also a comixture of excrements: For which causes poyson ariseth, and the nourishments are estranged from their scope; they undergoing also, various alterations through delay.

The which while the Archeus of the same place, well perceiveth to be in his jurisdiction, be being vexed, troubled, and as it were mad, doth as yet diversly more alter those excrements, and according to the perswasion of their poysons, formes together diverse Ideas of his own preturbations, that he may expresse the Protheus of the Poets, and represent a various tragedy of Fevers: Yet the Metamorphyzings, and ends of this poysonous contagion, are not therefore the objects of Physitians: For neither is the variety of the poysons, or sumptomes to be so much regarded, as the dignity of the place, and disturbance of the Archeus, and afterwards, by what means the poyson may be restrained, and the averfenesse, and stird up confusion of the Archeus may be reduced: For these being appeased, the Fever straightway ceaseth, and those things which do there materially offend, are easily tamed by nature, and retire it self as rightly subdued: This way indeed, Fevers do presently depart at the arrival of some one Arcanum, but the remainder of expulsion is committed to the shoulders of nature, that Hippocrates his dignity may be preserved; *That natures themselves are the Physitiannes of diseases:* These things, of continual, like as also of intermitting Fevers, and the birth-place thereof.

But the Quartane Ague alone being an Out-law, hath seemed to have more inwardly, or piercingly entred, or to have extended it self to the Spleen, without the Cottages of the stomach: Nevertheless it keeps its equal progress, and unfolding, upon the Archeus of the place; while as it committing the errors of digestion within its own Cottages, stirs up its furies at set periods.

Again, there is altogether a strange, and very unwonted Seat, Propagation, and unaccustomed perplexity of healing of malignant, camp, and purple or spotted Fevers, &c. to wit, while as stinks, &c. are drawn into the body by the inbreathed Endemics of places, Fens, Minerals, Fumes, Hospitals, sick Folks, and stinking odours: The which while they pierce through the lungs into the breast through the Midriff, do strike the connexed superficies of the stomach, and decypher the Idea of their own poyson-somness in the nourishment that is immediately to be assimilated: The which being therefore degenerate, stays it self there, and invites the Archeus of the place into its own furies: whence the unwonted Tragedies of Fevers do issue, to wit, very cruel, stubborn, and deceitful ones: Because they stir up the more dangerous drowie evils, watchings, and madneses, and anguishes, according to the spur of every poyson there bred, diversly stirring up the perturbations of the Archeus of life: So of late, Fevers have arose without thirst, heat, and tempest, for the confoundings of Physitians; because indeed they stir up Fevers in nothing more secure than the other: for some do swiftly, or slowly kill with some small beginning of cold, and that quickly ending; yet no less cruelly than those which molest with a great fierceness of Symptomes.

At leastwise now it is manifest, why vomitory Medicines do not any thing help that Fever of the stomach, and there uttering the signs of its Mansion: For although vomitory remedies may seem to tame the product of a Fever, yet they take not away the occasional producer planted in the Bough, and external part of the stomach. We may therefore be led by the hand from the Fever it self, and presently the indications fetcht from thence, will teach, that all those anguishes do begin, and are stirred about the stomach.

A wonder it is surely, that the Schools do nevertheless as yet accuse the Liver, and Choler, or Phlegm, to wit, putrified ones: since they observed that dejections or purgings by stool being promoted by Art, or the violence of nature, have nothing profited: For sleep brings labour in a Fever, but not in healthy persons; because sleep arises from the stomach, but not from the Liver, (the which more largely elsewhere;) But the original vice of a Fever, and its occasional matter is of that which is changed, and therefore also the changing action of the thing changing, and of those nourishments changed, is manifestly felt about the stomach: And therefore the solemn definition of the Schools is ruinous, which decreeth a Fever to be first kindled, and begun from the heart: But the occasional matter of Fevers is changed nourishment, immediately to be assimilated, that perhaps will be admitted for the stomach; but it will not be alike easie to conceive the dross or liquid dung to be retrograde or to go back from the Mesentery.

But surely although that thing doth regularly offer it self in healthy persons, yet not in Fevers, whereunto therefore any exorbitancy is singular, and proper: For so the liquid dung passeth from the womb of the urine, and seats of the stone, through an undirect departure, unto the *Pleura*, unto the veins of the stomach, and vessels of the gut *Duodenum*: Of which deviation there is no reason, but the very liberty of the confusion of the Archeus.

In the nex place (I will rehearse it) neither doth a Fever it self alwayes flow from, and is directed by a former occasional cause: For truly the Archeus himself, although he be not solicited by an external error; yet from the offence of his own incontinency, he now and then of his own accord taketh to him furies, and is luxurious through a proper insolvency of liberty: For he tumulteth, and from a light error frameth the Idea's of his own indignation no otherwise then he is oft-times stirred up from a ridiculous cause: And the which is less wonder in the universal Archeus, if he stumble; seeing he only is chief for the governing of so divers functions of faculties.

For because the Center of the malady hath placed the place of its exercise about the stomach, vain are the emptyings of the veins, and theevings of the strength: For truly the blood is void of fault: The which I have above sufficiently demonstrated. And it is alike ridiculous, to be willing to strengthen, or comfort by Alkermes, Gems, and Pearls beaten; I say to be willing to corroborate where the enemy bears rule within;

N n n n n

and drives the life it self head-long into all disorder, and confusion of dissolution: For the Enemy who was able to prostrate the health being entire, and strength being strong, will despise whatsoever shall be objected for comfort, while himself is present.

In vain therefore do they intend the helping of Symptomes, if a conquering Medicine be not present, and the which may restrain the confusion of the vital *Archeus*: The which indeed is the essential, and principal Effectresse of cures. And it is matter of grief to intend the corroborating of the faculties with one hand, which the other hand dejecteth by solutive Medicines, and blood-letting.

A plausible remedy therefore is measured from the effect, if it appeaseth the tumult of the *Archeus*, and extinguisheth the Idea of the Fever: For the place of the Fever being pacified, or the prison opened, the *Archeus* who before beat down all things, because confused, being now quiet, expels the enemy, and the occasional matters, the prison being opened, do suddenly flow forth: And that thing we contemplate of in a most difficult, and desperate case: For truly the contagion of the Pox or fowl disease being taken away, the bonie, and hard bunches vanish away of their own accord: Elsewhere also desperate Imposthumes happen oft-times from the guidance of nature alone: so unwonted declinings, dissolvings, resolvings, and departures are acknowledged even by the Humourists: And therefore I hope they will be the more readily inclining about the voluntary expulsion of the occasional matter of a Fever: At leastwise that help is not to be sought from solutive medicines, as neither from the theevish remedies of the vital faculties.

Surely the fury of the *Archeus* being first appeased, which forms feverish Ideas, what, and what sort of things ought to be, are easily afterwards sequestred: And that thing the sick do easily bear, and they find themselves the better thereby, as they are eased of a loading weight, and the confusion of perturbations sprung up in them: Therefore the knowledge of the essential thingliness of a Fever banisheth the hope which Physitians move from the cutting of a vein, solutive medicines, Scarrification, and Cantharides, to wit by reason of one fault, lest they should seem to have made their Visits in vain, and to ask a reward from deceit.

But seeing that the Fever being well nigh overcome, the *Archeus* composeth himself to tranquillity or rest, as by Crises's, Sweats, or by bleeding at the nose, or also by the Hemorrhoides or Piles, as it were the remaining wrestling of furies, he hath oft-times brought quietness, and health; That indeed hath deceived Physitians, and they have placed all their hope in the Horleech, and Blood-letting: neither have they considered that a meer remedy being administred, presently even the most swollen veins of the fundament do disperse without the effusion of blood; neither that they do hinder the attainment, or preservation of health, which otherwise should be impossible, if the blood of the Hemorrhoides were infamous with so foul a Character as it is decyphered to be. The choice therefore of Remedies in Fevers, is to be drawn from Secrets, whereof as there is a famous variety, so also a hidden, or unknown preparation: For the chief are those which pacifie the tumult stirred up in the life: Those which follow, are such as overcome the poison of a Fever: But those are more famous which contain both together. Lastly, There are some which are serviceable expulsively, to wit by a plausible cleansing, and resolving: Wherein the liberality of the Almighty is wonderful, which hath directed crude Simples for Fevers, and the which being moderately prepared, do mow down a Fever like a Sithe.

Surely I should rejoyce to make these manifest, but events experienced by my hurt, have affrighted me from it: For about the end of the last past age, I had begun to cure by the distillation of Sulphur, and Vitriol: I also told what those unaccustomed, and unknown Remedies were:

But at first Physitians shewed their Glove corroded, and resolved by the aforesaid Remedies, that they might affright the sick, that his stomach could not endure the same.

But when as afterwards, the false paint of the Physitians their dispraising nothing hindring, they saw those that were cured by me to be in good health, they bad some things to be distilled by my fugitive servants, which they had seen, and learned: Hence indeed Chymical Medicines passed over into the hands of Merchants and Apothecaries.

Neither indeed should I envy it, but that all things would be set to sale, as adulterated, as long as Gain, and Covetousness shall prevail: Surely it is to be grieved at, that nothing of these remedies is handed forth to Mortals, which is not most miserably adulterated.

At leastwise I will declare for those that are ingenious, That the spirit of the salt of Tar-

Tartar, if it shall dissolve Unicorns-horn, Silver, Quick-silver, the stones of Crabs, or some one of those Simples, it cures not only a Fever, but also many diseases sufficiently. But not that I hope that Silver, Quick-silver, or others of like sort are to pass thorow into the veins:

It is sufficient for me, that that spirit of the Alkali salt being by these bodies reduced into a volatile, and coagulable salt, and reduced in the shop of the stomach unto the rule of the meats, passeth thorow it into the Meseraick veins, at least being carried that way by the Urine, and by passing thorow them, licketh, and resolveth the filths there grown, through a forreign power assumed to themselves. Surely I could willingly communicate many, and more easie remedies of like sort, if the drowsiness and sluggishness of Physicians had not affrighted my pen, who gape only after gain, and expose the life of mortal men under the trustiness, and desire of lucre of the Apothecary, and his wife.

But as to a Quartane Ague, I am wont to drive that away by an Emplaster composed of a few resolving, and cleansing Simples; neither hath it ever deceived me, except that in fat or gross persons, the obediencies thereof are the slower.

An Impertinency.

The Authour desires to see that Humourist, who had equalized Air unto Water in weighing, that he might connex the *Galenists* their equal temperature [*ad pondus*] or according to weight: to wit, how much air is to be taken for a pound of water, that they may be equalized in weight?

Another.

The Air is neither light, nor heavy, because it is without weight; and therefore neither can it be weighed, nor equalized: Therefore the Doctrine of *Galen* is destitute of the greatest, and chiefest hope of complexions, because it hath a liberty of lying boastings.

A
PASSIVE DECEIVING
AND
IGNORANCE
OF THE
SCHOOLS THE HUMOURISTS.

The which if they shall henceforth defend, shall cover with a stubborn malice, God also being wroth, will discover the same in the now imminent age, for the profit of the Christian World, and the Confusion of the obstinat .

The PREFACE to the READER.

Had written in an unwonted Style, concerning Fevers, and when the little Book returned unto me, I scarce understood the same by reason of its gross, and innumerable faults: yet presently afterwards, however plainly vitious it was for that Cause, within a few weeks it began to be desired: Whence I judged, if a faulty Book had been worthy the Press, and much desired, that by a stronger right it earnestly required another Edition; not only that it might come forth amended, which would bewray the blemishes, and ignorances committed

against me, and so by a singular Doctrine would as nearly, and intimately as might be, weigh the life of Mortals, whereunto none as yet hitherto had attempted to answer: but more peculiarly, that the Unheard-of Doctrine thereof, chiefly true, although unexpected, might the more strongly be confirmed: Therefore I was constrained to over-add the Commission of my own Coyn, whereby it might on every side be firmly defended from the Humourists, the Pages of the Schools of Galen, and my Haters, and might not suffer the truth delivered, to be trodden under foot: wherefore I have added Reasons, whereby I have shewn the Vanity and falsehood of the device of Humours, whereby Physitians from a destructive foundation have circumvented the whole world, have fatted the places of burial, have destroyed Families, have made Widdows and Orphans by many ten thousands, and so have brought themselves into the merriments

Nnnnn 3

of

of Kitchens, and Comedies. Paracelsus indeed attempted to hiss out the Fallacies of Humours, and he hath at this day, his Followers almost every where, amongst the most learned men; yet never any before me (that I know of) hath professly attempted to untie this Knot: Therefore if any one hath heretofore threatned to lend his Quill against my Book of Fevers, because he took it injuriously, that I have not only overthrown the two Universal Bulwarks of Medicine; but especially that I have demonstrated, That no laxative Medicine hath ever hitherto drawn out electively, this Humour before that; yea that all and every of Purging Medicines were an hostile poison to the Life: Perhaps he will now lay aside his Pen, when he shall see the same Opinion to be more strongly confirmed: To wit, That the existence of both Cholers, and of Phlegm is impossible in nature; that the trifling Complexions, and Diseases diligently taught, and believed to arise from thence, are supported by false Principles: And by consequence, that the method of Healing instituted according to the distemperatures of Humours, is deceitful, meer dreams, old wives Fables, and trifling toys. For I ought to treat roundly, sincerely, and candidly, as oft as I have determined to write of God, Truth, the Life, and publick Good of Mortals. I implore him for my witness, as also my Fudge herein, Who is the Way, the Truth, and veriest Life in self of mortal men.

I have therefore willingly exposed this diligent search of Truth, and attained Victory under his Protection, and Bedewing.

Fare ye well my mortal Companions: I wish ill to all your prosperom affairs, Because I perfectly teach the Truth.

A
PASSIVE DECEIVING
AND
IGNORANCE
OF THE
SCHOOLES THE HUMOURISTS.

CHAP. I.

That the four Humours of the Galenists,
are feigned.

1. **I**T is answered by going to meet those who shall be willing to begin to write against the book of Fevers. 2. The received opinion of the Schools is supposed. 3. That it is false, whatsoever hath been hitherto diligently taught concerning the Elements, degrees, mixtures, discords, and diseases hitherto. 4. That heat is nowhere but from light, motion, life, and an altering Blas. 5. The limitations of moistures and drynesses. 6. The relation of a disease unto health, of what sort it is. 7. The remedies of diseases, from whence. 8. The unconstancy of Paracelsus, even as also of Galen. 9. That a return from a privation is not granted according to the Schools: the which notwithstanding do every where dash against this rule. 10. They fail in proving a quaternary of humours. 11. The two pillars of humours are broken. 12. Many things among simples have only two diversities. 13. A miserable reasoning from a similitude, for the number of humours. 14. The Schooles stumble in the light. 15. The maske of a sophistical argument is discovered. 16. The similitude from herbs, is opposed to the similitude from milk. 17. In like manner, the urine ought to be put for a fifth humour. 18. The perplexity of the Schools. 19. A convincing argument against humours. 20. An argument from a position supposed. 21. From a sufficient enumeration of shops. 22. From an impossibility. 23. From an absurdity. 24. Reasons, sixteen in number. 25. Against the position concerning phlegm. 26. From implicate blasphemy. 27. From its shop. 28. From the impertinencie of the supposed position. 29. From a convenient or agreeing thing. 30. From the Gewt, and wringings of the bowells. 31. From

an Erisepelas. 32. From Causticks. 33. From an Evangelical word. 34. From a defect of the seperater. 35. From the nourishing of the similar parts. 36. From an impertinency. 37. The deformity of a formed argument of the Schools. 38. From a like thing. 39. From the nature of an Element. 40. From the simplicity of its end. 41. A denial of a position. 42. From a Philosophical maxim. 43. From taste, and properties. 44. Who was the inventer of humours. 45. What a diversity of Soiles may argue. 46. From the blood of an Ethiopian. 47. Whence the venal blood is the more red in its superficies. 48. From a like thing. 49. Whence there is a change of colours in things. 50. From a shew of the deed, in many things. 51. The childish inspection of the Schools of out-issuing blood. 52. Miserable impostures. 53. A ridiculous omission of the Schools. 54. The judgment of Physitians fights against it self. 55. Privy shifts sliding from involuntary cheeks. 56. A cruel or hurtfull little book concerning the nature of man. 57. From effects, and fear. 58. From the confession of Physitians. 59. Dunghill Physitians distinguish not men but by dungs. 60. A ridiculous argument of the Schooles. 61. An argument on the contrary, from a maxim of naturall Philosophy. 62. A convincing argument. 63. Galen ridiculous about the cause of the variety of humours. 64. The perplexities of Galen. 65. Refutations by the Beginnings of natural Philosophy. 66. An error of Paracelsus. 67. The Schools are ignorant of the venal blood. 68. An argument against the position. 69. A false and ridiculous supposition of the Schools concerning the supplying office of the Spleen. 70. Absurdities. 71. A handicraft demonstration. 72. Against the position concerning black Choler. 73. Many absurdities follow. 74. The Schools do most miserably prove their position for black choler. 75. Some defects following thereupon. 76. A convincing argument. 77. An Idiotisme of Paracelsus. 78. Sharpnesse doth not ferment Earth. 79. From an impertinency. 80. A convincing argument. 81. From an impossibility. 82. A ridiculous supposition of the Schools, and four absurdities thereof. 83. Some absurdities accompanying the opinion concerning the hony of Galen. 84. From things implying. 85. By a convincing argument from the supposition of a falshood concerning the Elements. 86. From a number of the Elements. 87. A brutish objection. 88. If we must not proceed by humours how therefore must we cure? 89. The praise of the volatile salt of Tartar.

I Have sent forth an unheard of Doctrine of Fevers, that I might hear what the more fruitful wits might teach me: For there were some who had promised that they would be arbitrators or judges in the Case, whom notwithstanding I conjecture, so long to be silent, untill I had set forth a treatise of humours, which I had promised to gather out of my great works.

For truly they could not be ignorant, that if I could sufficiently demonstrate, that the humours accustomed in the Schools (besides blood) were never, or never to be in nature: they also were to have no contention with me, concerning Fevers: And that thing I now promise ingeniously to performe: not indeed as that I may be glorious by the name of a Paradox, but altogether from compassion towards young beginners that are badly instructed, and toward the sick that are badly handled under the device of humours.

Therefore I will state the forme of the matter: For indeed, the Chyle or juice of the Stomach being supt up into the veines of the mesentery, they affirme the same chyle to be conveighed unto the Port-vein of the Liver, to wit, a trunk arising out of the small branches distributed through the mesentery into the intestines or bowels; And that, that Chyle in the time of its passage through the slender trunks of the veins extended into the liver, is by the power of the Liver converted into blood, and also into phlegm, and a twofold choler.

And that this choler is afterwards seperated, partly into the spleen, and partly into the litle bag of the gawl: To wit, that they may be the keepers of both their own superfluous

fluorous choler; but that the two natural Cholars, as the entire and constitutive parts of the blood are co-mingled together with the blood, for the necessities of the parts to be nourished: in the due proportion of the quaternary of which humours, that as health doth consist; So on the other hand, that in an undue proportion thereof, all diseases are entertained: But that an undue proportion thereof proceedeth, as well from the perpetual strife, and hostile, and unwearied contrariety of the four repugnant Elements, as from the voluntary distemperature, and inbred fight stirred up, of things received into the body.

Truly I have already, in the Beginnings of natural Philosophy, and rise of medicine, sufficiently removed the foregoing cause of so great a fiction: To wit, where I have sufficiently demonstrated, that there are not four Elements in nature, and by consequence, if there are only three, that four cannot go together or encounter: Therefore that the squadron being broken, cannot cause four unlike Elementary combates, temperatures, mixtures, contrarieties, hatreds, strifes, &c. For I have taught clearly enough, that the fruites which antiquity hath believed to be mixt bodies, and those composed from a concurrence of four Elements, are materially of one onely Element.

In the next place also, that those three Elements are naturally cold; nor that native heat is any where in things, except from light, life, motion, and an altering Blas: And so that heat in the Elements, is a meer Relolleum.

In like manner also, that all actual moisture is of water; but all virtual moisture from the property of the seeds; Likewise that drynesse is by itself, in the aire, and earth: But in fruites, by reason of the seeds, and coagulations: Therefore that it is a false doctrine, which is celebrated concerning the Elements, mixtures, qualities, temperaments, discords, degrees in order unto diseases, and the curings of these.

I have also professedly demonstrated, that there are not contraries in nature: That health is opposed to a disease with relation of that which is entire, unto that which is defective.

To wit, that remedies do take away a disease, not by the force of contrariety, as neither by reason of a naked similitude or likenesse; but by reason of a meer gift of goodness, restoring nature by helping her; the which otherwise, is the Physitiannesse of her own self. These things surely were sufficient, and might be able to take humours out of the way, unlesse an opposite custome had as it were tied up the mind, least it should hasten unto the knowledge of the truth: For it is a very difficult thing to disaccustome those who are confident in themselves, that by those humours they have long since compendiously viewed every catalogue of a disease: Wherefore unto those that are desirous to learn, I will willingly reach forth my hand.

For *Paracelsus* as the first, so laughed at humours after an *Helvetian* manner, that he mocked the *Galenical*, also the *Arabian* Physitians with the surname of Humourists: Notwithstanding, he himself being oftentimes unconstant, slides unto humours, and complexions, as not being as yet sufficiently grounded in his own positions. In the meantime, the *Galenical* Schools would now and then, have the four granted qualities of Elements to be opposed, as solitary distempers: and for the most part again; they have feigned distempers to be banished with the abundance of the like humours: And whenas they gloried that they held the Hare by the ears, they being deluded with the easiness of the fiction, first became a laughing stock; because they defiled the faculty of healing with absurdities.

Being first of all, unmindfull of their own discipline that there is not granted; an immediate return from the privation of a Forme, unto an habite; yet have they through a rash perswasion affirmed, that flesh is constituted of four humours, and that this flesh is again to be resolved into the same four: For they decree, that the Chyle is framed of the meats, being indeed homogeneous or simple in kind, in the stomach, the which notwithstanding, the excrements of the belly being seperated, should alwayes be made four humours besides the urine, by the one only action of sanguification; but never one only, two, three, five, or more: And that thing they have thus determined of, as being rashly mislaid by a quaternary of Elements: From whence at least wise it followes, that this fourfold re-dividing of one Chyle, doth not derive it self from the diverse varieties of meats; but that it altogether essentially dependeth on the very proper perfect act of sanguification: Which thing wants not its own absurdity: To wit, that of one natural act, there should be a fourfold scope essentially differing.

- 10 But the Quaternion of Elements being already elsewhere cast out, with the combating concourse of the same, that fourfoldnesse of Humours hath indeed been supposed and subscribed unto; but not yet proved hitherto: For, for the furnishing of so great, and so pernicious fables, the Schools have been snatcht away by two swelling arguments, the which, if thou shalt but a little presse, they will pour forth a stinking vapour, but not the juice of truth.
- 11 The first whereof, is fetcht from four Elements, that they may constrain the blood against its will, under a quaternary or fourfold number of Humours, unto the obedience of three only Elements existing; although the blood it self be materially made of one of them only.
- 12 As if every one of them which they believe to arise from the wedlock of the Elements, ought therefore of necessity, to have four Heterogeneal or different kind of parts agreeable to as many their own Elements: (Surely I have elsewhere every way shewn, that some bodies have nothing of a diversity, not so much as in salt, Sulphur, and Mercury, but that others do at length produce only two diversities of kinds) for neither is there a stronger reason, why a flint may be reduced into one only, and at least, a similar salt, than the blood can of necessity be seperated into four Humours: For from hence it is made manifest, that the reason of a feigned Quaternary of Elements is from a former cause, in respect of a Quaternary of Humours in the blood, and no where else.
- 13 But the second and chief argument of the Schools for a Quaternary of Humours, is not a certain formall reasoning; but a naked and miserable inference, established by a similitude or like thing: For they say; In Milk there is found Whey, Cheefe, and Butter: That is, three distinct things: Therefore of necessity, in the blood, there shall be alwayes, and constitutively four, because they observe four diverse things or parts in the venal blood of some persons: the which indeed, the soul, the Chambermaide of the desires, hath by much labour, and the helps of fiction, divided into four diversities: For they oft-times take notice of the water swimming upon the blood, and because it is yellow, and somewhat pale, they therefore name it yellow choler, or gaul (although it be not bitter and wanteth the essential property of the gaul.)
- But the sediment thereof about the bottom, being sometimes the more weighty, and black, they call black choler; but in the middle space they note red blood, wherein while they observe white fibers or threds, the Mothers of a gellyie coagulation, they have called those Phlegm: For the vein of the ham of maides being cut, those fibers appear in lukewarm water, like unto spiders webs, which they have called Phlegm.
- 14 But first it had behoved them to have discerned, that the unfit similitude of Milk and blood, doth teach, or urge nothing: Because the water swimming on the blood, is not the fannesse of Cream swimming on the Milk: wherefore either the agent, or matter is unlike, or both: And therefore in so great an unlikenesse of both, that a necessity of Humours in the blood is not rightly founded.
- 15 For the careless Schools do not take notice, that a diversity of kind is bred in the blood, after that it hath disposed it self unto corruption that is soon to come thereunto: Therefore that Hetrogeneity accuseth indeed, an unlikenesse of contents made in death, but in no wise therefore, a necessary connexion of lively Humours: For what will they say of that blood which wholly wants all whey? Or the which being uniformly coagulated throughout its whole, is red? Which is a frequent thing after many sweats, and abstinence from drink: Shall therefore the Whey swimming upon the blood, the urine and sweat left in the blood, be Synonymals with choler and gaul? And something that is one with the very essence of the blood?
- 16 Indeed have hitherto seen in herbs, on only clarified juice; as likewise I acknowledge one onely blood, the constitutive Humour of us: To wit, I professe a simple sanguification, and one only action of one Liver, and a single Chyme or concocted juice to be made of an undistinct Creame or Chyle, and by one onely ferment of the stomach; which sanguification or making of blood I know to be a meer formal transchanging of nourishments, but in no wise, only an applying together of Heterogeneal parts alone.
- 17 For neither, although part of the chyle be turned into urine is an unlikenesse of the agent the Liver, to be blamed; but only the incapacity of the receiver: For neither therefore, have they dared to embrace the urine for a fifth Humour: For although a part of the urine materially remaineth in the blood, yet it is not of the nature of the blood, even as Whey in Milk, is after another manner, an essential part of the Milk.

The water therefore, swimming above (which they confesse to be sweat, Whey, and a remainder of the urine, and so believe it to be wholly excrementous) they shamefully compare sometimes to the Buttery part, and that which swims on the Milk, being suited to the Element of fire; and at another time, to the Whey of the Milk; And far more shamefully do they undistinctly liken both of these to the Gaul.

Therefore four Humours shall equally be made of any meat under one act, and the same shop of sanguification, because they are immediatly, principally, and simply, and always intended by the Liver; or they are made in unlike places and moments: Not indeed, in unlike ones; because so there should not be constitutive parts of one and the same blood: But if in like places, and moments; Why, while urine and choler are made at once, is not one individually mixed with the other, even as also gaul with the urine? Why in the next place, is the urine never bitter, if gaul be always comixed with it, whereby it is tinged as they say? Why, when the gaul is broken in a fish, can none however the more exact washing, take away that bitterneffe? And after another manner, one onely smal drop of gaul, should defile a whole bucket of urine with bitterneffe?

Who in the next place is that so exact Seperater, which was able to seperate the watery Choler from the urine, but could not materially seperate all the urine from the blood? Wherefore at length, is not that Choler or gaul of the blood snatcht together with the urine to the kidneys (which a total absence of its bitterneffe proverth) if Choler be believed to be throwly mixed with the blood above the Liver.

Let us therefore consider how choler being made by the Liver, in the Liver, shall come down unto the little bag of the gaul: In what place sanguification is wrought? Whether about the Port-vein, and hollow of the Liver? Or indeed in the very body of the Liver? Or lastly in the very hollow vein above the Liver? But in whichsoever of these places that choler is made: at leastwise there is not from thence a vein of return for choler, unto the little blader of the Gaul.

For it ought to proceed from the Liver unto the Gaul, by a retrograde motion, and uncertaine passages of conveighance: Why at leastwise have both those cholers remayning in the masse of the blood, their own excrements, and seperated Innes?

But phlegme, and the blood want excrements? For if both of them are made beneath the Liver what seperater therefore seperates them? And which way? Since they being generated at once in the same place, are perfectly mixed with the urine: But if the Gaul, and also black choler be made together with the act of sanguification, in a most swift passage thorow the smal and slender little branches of the veines extended into the Liver; I pray let young beginners be mindfull of the slendernesse of those little branches, or veines, which is scarce sufficient for the transmitting of the vrine, and so that they should require a momentary transmutation of the urine blood, and the other three humours, to be made by the Creame.

This matter I have elsewhere profesly explained in a full treatise, concerning a sixfold digestion.

And in the 16. brief head in particular: That Choler is not made of meates.

And in the 17. That the Gaul is a bowel in forme of a liquour, and the necessary balsame of life; but in no wise an excrement.

In the 25. The curious opinion of the Schooles concerning the Gaul, is unfolded.

In the 26. That nature had been more carefull for the Gaul, than for phlegme.

In the 27. That the seperation of the urine, and of the wheyiness of blood, differs in the whole essence from the seperation of the wheyiness out of Milk.

In the 30. How much Gaul imports, beyond every disposition of an excrement.

In the 31. Why birds might want urine and a kidney, but not a Gaul.

In the 35. That the excrements of the kidneys, and belly, have indeed the colour of Gaul, but not that they are therefore tinged with the Gaul, and much lesse with choler.

In the 36. After what manner the dung excludes a comixture of the Gaul.

In the 37. That excrements may seem Gaully, which are no way Gaully, and therefore that these things have been rashly passed by, by the Schooles: Also that a leaky liquour is not of the Gaul, the history of a Cock proverth, and some following experiments, in the Chap. of the Pylorus, Sec. 24.

The which, that I may not here with a tediousnesse repeate, the curious Reader shall enquire, and he shall finde them in the places cited: For if the Liver generateth both

Cholers, and Phlegm, together with the blood, why doth it despise, and lay aside a great part of them for an excrement? but reserve the rest in the blood? when as otherwise, of simple and homogeneal blood, there either ought to be no duality of any of its particular parts, or there should be the same necessary duality no less of Phlegm, and Blood, than of both the cholers. Neither doth reason otherwise suffer, that the same singular Cream of the meats should be daily, and alwayes, and equally divided into six parts; to wit into blood, both Cholers retained in the blood, and again into both the excrementitious Cholers, and (those shut up within their own entertaining places) & at length into phlegm; especially when as the gaul differs from the liquor swimming on the blood let out of the veins, in its whole property. Unto which six humours if thou shalt add the Urine; now seven humours shall ordinarily be framed of one only Cream, and the supposed device of a quaternary of Elements, and the necessity of that fiction perisheth.

- 25 Therefore if these are made by one only act of one liver, in a direct, and ordinary course of Ordination at once, why doth it generate those things as necessary out of the homogeneal liquor of the Cream, whereof there is no way a need for a Being, as neither for a Well-Being? But if they are for nourishing, why doth it rather sequester both Cholers into their own sheaths, and the chief Mansions of Constitution, than Phlegm? to wit, the which, they blush not to confess, to be a defectuous liquor, cold, and so a partaker of death, error, and a vital want? But they will have Phlegm to be laid up in the vein, and to be re-cocted into blood: Therefore it is not as yet [This Something] being as yet crude, undigested, and uncocted, not yet a true, particular Humour, and not yet a constitutive one of the blood; seeing it is as yet deficient, no otherwise then as the juyce of unripe Grapes cannot be called Wine: For if Phlegm answer to water, even as they also liken the blood unto air; one ought to be as perfect in it self as the other, and as equally necessary, if there are four Elementary Humours equally necessary for the composition, and successive Alteration of us.

Surely that thing contains a Mockery, that a Humour failing of its appointment, should be ordinarily changed into another Humour: As if the Water had not its own Perfection, Ordination, Order, and Constitution, but were naturally brought into air, from the scope proposed by the Creator.

But I have elsewhere shewn in our Physicks, that Water can never by Art, or Nature be changed into Air, nor likewise this into Water. If therefore Phlegm resemble Water because it containeth it, and Blood, Air; the adopting of any Phlegm into blood shall never be able to subsist: And by consequence, it is a feigned thing, whatsoever hath hitherto been diligently taught concerning the union of Humours, and Elements, their Likeness, Commixture, Complexion, and Necessity: yea, if phlegme be not as yet mature, and through an over-hasty swiftness of time, it be only in the way unto blood, and therefore left in the veins, and mixed with the blood that it may be perfected, and at length may nourish; now not only the Liver shall be the shop of the blood, but any Pipe of the veins shall have the nature of a bowel; and because it containeth its properties, and offices, it should be preferred before the Liver in sanguifying, and in the perfecting of the blood. Yea neither should Phlegm be essentially a separated Humour from the blood, no otherwise than as a sour grape differs not essentially from a ripe one: Therefore by the same title, the whole Chyle of the stomach shall be Phlegm.

- 26 Again, since Phlegm is attributed unto old age, defect, and imperfection; therefore also nearer to death than Choler, and hence also, more an enemy to nature; the workman of things had seemed to be the more severe, who had left such an enemy to be suitably mixed with the blood, throughout all the veins, and had not designed a receptacle for it. He I say, who made not death, had from the beginning coupled the necessities of a defect unto humane nature.

- 27 In the next place, since that being granted, Sanguification should not be the proper office of the Liver; and the Liver shall be able to operate more perfectly, and more at a far distance in the windings of the hollow Vein than near in its own house; unless the Schools had rather to attribute Sanguification independently to the veins.

Finally, if Phlegm differs not but only in maturity, it is not an Humour essentially distinct from the blood: and by consequence, the Quaternary of Humours passeth into a Ternary.

- 28 And then, as *Galen* witnesseth, more of phlegm by two-fold, is daily made (which he proveth by a Tertian Ague) than of Choler: How much Phlegm therefore shall not be made in healthy persons, and those perfectly digesting? And how much of phlegm shall not be daily generated in the more cold bodies, if Humours are made according to the dispositions of Complexions? Yea from thence it follows;

that

that every digestion is alwayes of necessity, and naturally defectuous, and vicious: Because nature shall never attain the end, and purpose of nature, If phlegm be naturally generated as a fourth Humour of the blood. After another manner, phlegm ought to fail in temperate bodies, together with both the Cholers.

Why I pray, is blood abounding turned into fat, since it is far more easily (as they say) concerning the Drawers forth of Choler) changed into Choler, and loads nature with a less weight than Choler, which so obediently obeys a calling Solutive Medicine.

But why doth he that lives soberly in a temperate complexion (as they call it) daily lay up both the Cholers into their own Receptacles? Doth it not rather from thence plainly appear that the Gaul, and Spleen are nourished by some other thing, and by a vital liquor, than that which being banished from the blood, hath attained the conditions of an excrement?

But go to yet, what is that Humour in the Gout which is troublesome with so cruel a pain? I indeed have elsewhere on purpose proved, *That it is a sharpness*; Wherefore also according to the institutions of the Schools, *it is cold*, and therefore different from Choler, and Fire: Yet in the Gout which they call the *Hot one*, (for by how much the sharper it is, by so much also the more cruel) they complain of most sharp pain, and heat: Therefore Choler either shall be sharp, nor any longer bitter, or the Schools have forgotten a fifth Humour.

Let the same equal Judgement be in the Colick, and wringing of the bowels. In the *Erisipelas* also or *Anthones* fire, the Humour is sharp, because it is that which waxeth mild by soapie Remedies: Therefore Choler or Gaul is not bitter. And then in Caustical, and Escarrhotical affects, (namely in the burning Coal, *Persian* fire, &c.) there is a Caustick or burning Salt of the condition of *Alcalies*, but not a bitter one: Even as neither in the Cancer, Wolf, all running cancrus Ulcers, and those causing the greatest pains. For the salt which gnawes, is no way bitter: Wherefore effects that are most fiery in us, deride the vain device of Choler; Especially seeing they who imitate the nature of Fire, are not the Clients of a Cholerick Humour.

Therefore if according to the admonishment of the Word of Truth, *The Tree be to be judged of by his fruits, but every thing by its Works, and Properties*; I see not from what Use, End, Necessity, or Rashness, they have feigned yellow Choler to be fiery: For there was no necessity, like a Fable, to feign three daily, and domestick constitutive Humours of us, that is, without which we cannot live; which never were in the nature of a thing, or do suggest any necessity of themselves.

But what, or what sort of bowel shall separate both the superfluous Cholers from the choice blood of the veins? The Reins indeed separate the Urine for the Bladder; Shall therefore both Cholers want their own Separater? Or shall excrementous Choler go of its own accord unto its own sink? For there is not so great a necessity of the Urine, as well in its Being, as in its Separater, as there is of both Cholers, if both the Cholers are simply necessary as to their Being: For truly Birds could commodiously want Urine.

Why therefore was nature less careful that she might make a bowel for the expurging of Choler, than she was for the ejecting of Urine? Shall therefore the Chest of the Gaul, and Spleen, perhaps strongly attract both the Cholers unto themselves without the aid of a Separater?

Yea seeing Sanguification is a Simple, single action, and of a natural scope, surely one only Liver could not produce four Humours at once, out of an Homogeneous liquor, diverse from each other in their whole Element, and separate two only as hurtful far off from each other: Otherwise if the Liver should be sufficient for the separating of its own Liquors, it had separated the Urine by a stronger right, and had made the necessity of the Kidneys altogether vain.

In the next place, if it doth not sequester all the Choler out of the blood, not so much as in the most temperate strength, nature shall alwayes of necessity offend even in the abounding of both Cholers, in the excess of heat for the forming of Choler, and of Cold also for Phlegm; and likewise shall continually offend in separating.

And so, seeing both Cholers accuse of a necessary access in a just temperament (as they call it) these could never be made fit for nourishment.

Since moreover, we are daily nourished by the same things whereof we consist: to wit of a temperate, and lively feed refusing both Cholers: And there shall be the like reason for both Cholers, which there is of Phlegm: That if this be perfected into the blood within the veins, Choler shall no less be made blood in the Arteries: For if Phlegm be changed

ed into blood out of a natural, proper, and requisite shop, much more shall yellow Choler be fit, that in the heart it may degenerate into the more yellow blood of the Artery and into the spirit of life, and the heart shall be the restorative shop of a gawly excrement.

37 But alas, how miserable an Argument is it! while as the blood let out of the veins disposeth it self to corruption, sometimes two, three, or more liquors are seen; therefore there are as many constitutive Humours of us.

38 For blood is wholly changed into milk, and then after its corruption, it hath only three subordinate parts, to wit Whey, Cheese, and Butter; nor ever more: For sometimes it is totally coagulated in the Dug, into a hard swelling, in the form of Cheese; now and then it wholly passeth over into a white, yellow, somewhat green, &c. corrupt Pus: Sometimes into a pricking, gnawing, watery liquor, as in the Disease called *Choler, Ulcers, &c.* Elsewhere also it totally departs into a salt Wheyish liquor, as in the *Dropfie*, and many Hydragogal or water-extracting Medicines: Oft-times also it waxeth wholly black like pitch, as in blood that is chased out of the veins in a Gangreen, &c. but frequently into an ashie and stinking clay, or slime, as in Fluxes: At another time also it wholly passing over into a yellow poyson, shews or spreads forth the Jaundise, in which manner also it boasts it self in those that are bitten with a Serpent: Elsewhere also the blood is without the separation of an Heterogeneous matter, wholly changed into sores issuing forth matter like honey called *Melicerides*, into swellings of the Neck, or Arm-holes, containing a matter in them like Pulse, &c.

And in the *Pissing-Evil*, the blood is totally changed into a milky liquor; Even as under a *Tubes* or Consumption of the Lungs, it wholly passeth into a yellowish spittle.

Are therefore perhaps as many Humours to be constituted in the blood, as there are beheld degenerations thereof? And shall there be as many Liquors in Rain-water, as there are things growing out of the Earth? For the blood is in us like unto water; neither had 39 it need of divers seeds in the Liver, that it may be one only equally nourishable Humour: But in the last Kitchens it attaineth its own requisite diversities, whereby it performeth the office of nourishing: And so it should in its beginning in vain exceed in divers seeds, and diversities of kind, the which at length ought totally to be Homogeneally reduced 40 into one only glewie, white, and transparent nourishable Sperm or Seed, for the support of the similar parts, or to remain red for the flesh of the Muscles, and substance of the bowels.

Wherefore I steadfastly deny, That the blood as long as it liveth, or is detained in the 41 veins, (although after the death of a man) is coagulated; and by consequence, that it hath integral, unlike parts, with any Heterogeniety of it self; But that all diversity in the blood, is made only by the death or destruction of the same: Therefore the diversity of Humours is the daughter only of death, but not of life.

Neither is that of concernment, that Excrements do now and then occur in the body, which dissemble the countenance of blood; To wit, from whence they are made by 42 degeneration: For Urine is no longer wine, even as neither are corrupt Pus, or Snivel; or spittles, as yet parts of the blood; Because Excrements are no longer that which they were before their corruption; Because every thing assumes its Essence, and name from the bound of transmutation.

For what doth it prove, if blood by Phlebotomy separates water, or other soils in time of its corruption, if the same water be thereupon, neither Gaul, nor Choler, nor bitter, and wants the properties of Gaul? Or what a rash belief is that; *Water swims on dead blood*; Therefore it is gawly Choler, which under a false taste, dissembles the bitterness of Choler? For that Water swimming on the blood, is not an entire part 43 thereof, nor of its Essence, or Contents, or more near akin to the Blood, than a Chariot in respect of a man sitting therein.

It is therefore to be grieved at, that for so many ages, none hath ever tasted down that water; but that they all have engraven their names on the trifles of their Ancestors; that I say, under a shew of healing, the Schools have delivered the destructions of the sick under false Principles.

For truly Humours are destructive Ignorances, sluggishnesses, and shamefulneses introduced by the Father of lies, and celebrated by the loose credulity of his followers. 44 For although the bottom of the blood doth sometimes look the less red, it shall not therefore be black Choler: Even as neither is the sediment of the Urine Phlegm: But while the life of the blood departed, its no wonder if all particular things which were kept in the unity of life, do re-take the material conditions whereto they are obliged.

For

For the variety of soils in liquid bodies, depends on a prehemineny of weights, Because they have a latitude in weight, which after death, become Heterogeneal or of a different kind, 45 and by degrees do hasten into a disorder of confusion.

For will a man that is of a sound judgement believe, that Wine, Ale, and the juyces of herbs do lay aside their own black Choler at the bottom, together with their sediment: For what hath black Choler common with the heterogeneal substance of a sediment?

But as to the Colour; every *Æthiopian* hath his Blood almost black, but for the most part without whey; yet none of them is Melancholy, but all wrathful: For the blood which by the encompassing air is presently cooled in the Basin, waxeth more red than that which being sunk unto the bottom, hath the longer continued lukewarm. For this also is ordinary, that any blood being chased out of the veins, presently waxeth black in the body: For whatsoever things do readily putrifie, do easily admit of the companions of putrefaction, and that part of blood doth sooner putrifie which hath the longer continued warm after its death. 46

Therefore neither is it a wonder, that the part of the lower ground thereof becomes more intently black: But that black blood is not a separation of weight in the Blood, and much less black Choler. I have separated nine ounces of fresh Blood, and that as yet liquide, into Porringers: One whereof I exposed to swim in cold water; but the other part being equal to the former, I longer detained in a gentle lukewarmth: And this shewed very much of black blood, but the other not any thing. A diversity of kind therefore in a dead liquor presently putrifying, and putrifiable, is a suitable sign of corruption: And the which therefore neither hath a vital or seminal Beginning, a sign, as neither an Argument of its primitive composition: For we are Originally composed of a vital seed, and are resolved into a putrified and cadaverous watery Liquor: The which also oft-times happens in part, in living bodies. 47

What if the Blood, of pale, becomes red, shall that therefore be ascribed to Phlegm? Shall red Apples be more sanguine than pale ones? Blackish plums be more melancholy than whitish ones? For Colours do not denote feigned Humours, or Elements: But they imitate the properties of the middle life, and appointments of the seeds. 48

Thus is it; Colours, and Thickneses in the matter, are works of the seminal Archeus; But not the confused testimonies of Humours being put or applyed together. 49

Have thou recourse unto the *Book of the Unheard-of Doctrine of Fevers*: That I have lookt into the Bloods of two-hundred Countrey healthy persons in one only morning, which were remarkable in the aspect of colours, and diversities of grounds: For some of them resembled a blackish, and constrained jelly, being oft-times also thoroughly mixed with a greenish liquor, and sometimes only lightly besprinkled therewith: Also another Blood was watery throughout its whole; Another was snivelly; another was red in the bottom, another rather in the top-part thereof; a water swimm'd upon another, being cleer, pale, somewhat yellow, the which elsewhere lay hid as shut up in the middle of the blood; Another Blood was poyntingly speckled, and another of red, became pale throughout its whole; another was inclinable into a Pomegranate, and another into a black Colour: Even as lastly, another was somewhat green throughout its pavements. 50

I take pity on the deceiveable inspection of Blood issuing out of the body, and the accustomed Judgements from blood let out of the veins, the fictions of Humours, and the readie credulities of the sick. For a divining beholder of the blood is presently busie to fore-tell from the conjecture of an Humour, the name, and properties of the peccant and super-abounding Humour, and also the manners, complexion, inclination of the man; the particular kind, greatness, and event of the lurking disease; and moreover the kind of death, yea and the dependency of fortunes. 51

But whichsoever of the Humours shall offend in the Table of the inspection of Blood flowing forth, that is presently banished with a diminishment of the head; and unless it shall forthwith after obey, it is to be put to flight by an infamous stool: Because the Physitian hath the peculiar Guardians of their own Humours ready at hand, which may bring them forth all severally bound, and putrified; For thus they mock the ignorant, and in the mean time thus also the frequency of Visits is confirmed: Because they have known from a fore-judging, of what sort the white of an egg will be, which by receiving of their solutive Medicine shall return putrified: For even the most phlegmatick person amongst them, if he hath used Rhubarb, will void a yellow excrement, and less tinged, if he shall take Scammoneated Medicines; but not a slimie or snivelly liquor, such as is voided from the receiving of the Magistrals of *Coloquintida*; (for all the 52 the

the compositions of the shops are supported with Scammony, or *Coloquimida*, or both, as it were with two Pillars :) Oft-times also, whom this man judgeth to be Cholery, another calls Sanguine; but if they shall see one whom they esteem to be Phlegmatick, to be once angry, others also will presently contend that he is in a raging heat through Choler. And Scammony being drunk, one derides another, if they be called apart, because he hath drawn Choler so plentifully from a sanguine man, and he secretly insinuates by that very thing, that the greater reward is due unto him, as being skilful in his art; For in the truth of the matter, fraud, & fruit connexed with deceit do flourish, as oft as vain complexions, and Humours being neglected, and the betokening, and aspect of the blood let out being disregarded, it is fore-known from the poysonous property of the solutive Medicine received, what kind of dreg every one is to cast forth.

Indeed a solutive Medicine with them, is an assistant to the function of the Liver: Because it frames the Humours which they will have it to do, and shews them in a bravery brought forth at pleasure, and that according to the fore-knowledge of an Imposture: And they boast as it were from a three-legged stool, that they have fore-told to the sick the colours, and properties of the offending Humours to be brought forth, and that those sick having gone to stool, have answered in the divination, unto their fore-known Sooth-saings.

53 Surely a wretched Doctrine it is, and ignorance to be expiated by punishment: because that person is most miserable, who having taken a consumptive medicine, hath suffered his blood to be exhausted under the mask of putrefaction. But at leastwise it is a wonder, that the Schools have passed by the excrementitious filths of the Ears: For they are those which being yellow, and bitter, might afford a fresher remembrance, and firmer belief of yellow and bitter Choler, than the water which swimmes on the venal Blood: There is now therefore in the Brain a little bag of Choler: But these filths appear not for the nourishment of the brain, but when the blood is consumed: but the Gaul cannot remain in its former Being or Essence when the Blood is spent, whereof it had been an entire part: An aid therefore for Choler was fetcht from an excrement formally transchanged, especially because it alone exhales through the ears in the shape of a smoaky vapour: For by how much the deeper an Ear-picker is sent into the ear, the less of those filths is shaved of: They are therefore ridiculous, and weak arguments, as many as beget an hope for Humours. The colours also of an excrement cast forth, are the effects of a purgative medicine being drunk, but not testimonies of the abounding, or conformity of an elected, and rejected humour.

54 These things are described at large, concerning the Doctrine of Fevers, in the Chapter of Solutives. Sufficient for me is the testimony from the mouth of the Schools, that among all loosening medicines, Aloes is only unhurtful. They are not innocent therefore who profess this, and in the mean time cease not daily to make use of other hurtful Medicines; not because they find those things which they teach to be hurtful, to be healthful to the sick, but because they find them to be profitable to themselves.

55 What do we, and shall we do, will some say, for unless we now and then open a vein, and provoke the Belly, we stay at home, and are made the scorn of the vulgar, and the Fable of Stages?

56 For a little Book is fore-read in the Schools, concerning the nature of man, being reproachfully ascribed to *Hippocrates*: Teaching, that one solutive Medicine being administered, and that in a like quantity, at divers stations of the year, will wipe out divers Humours, and that always after Convulsions, together with the blood thus masked, it will take away the life: which soundeth, that under the specious pretence of purging, an authority is granted of putrefying the blood, of co-melting the flesh, and that under the deceit of the Humours of any colour, according to the will of the Physitian, and at length, that unless the Dose covers the deceit, and poyson, the blood which is to flow forth thus changed, will bring death on the sick party: so that although it be said in the afore-said little Book, That one and the same laxative at different stations of the year, doth at first draw out different humours; yet it is constantly true, that every loosening medicine taken beyond a due dose, kills its receiver: So that frequently the consuming power thereof remains so stubbornly tinged in the veins, that it cannot be restrained, and death follows after by a comelting: Although the solutive potion itself, and patron of death shall first almost wholly fall out of the body: And in vain are restraining remedies administered in this case; where the retentive faculty is not hurt, but the imprinted poyson continually consumeth: Wherefore rather an Antidote is required, than an astringent medicine: For that which a deadly flux by offending, causeth; that very thing doth laxative

ative Medicines perform under the cunning craft of Physitians, involved in the false position of Humours. At length the guilty, and accused guiltless Humour being drawn out, yet the disease for the most part is not any thing the milder thereby. Are not therefore Mockeries to be conjectured from thence? and whatsoever hath been prated concerning Humours, their excess, choice, and separation? For it is daily seen, that the events do frustrate the hope of the sick, and promises of Physitians: And therefore neither dare they certainly to promise health by a with-drawing of Humours by their laxatives; the which alone, they notwithstanding, seriously accuse for the containing cause of diseases; Because indeed they are badly instructed, and too much at the persuasions of false Maxims: Yet Hippocrates saith, *If those things are extracted which ought to be extracted, the sick feel themselves the better, and do easily bear it.* And moreover neither dare they to trouble bodies with Purgers in good earnest, before the Disease hath caused an hope of its digestion, but nature an hope of her victory, (and that without the endeavour of Physitians) to wit, of a future Crisis.

But this is done, lest the Schools their solutive Medicines, and also their own Maxims should be defamed amongst the vulgar, if laxative potions being fore-timely drunk before the bodies are in a chase, that is, before a prostrating of the disease, a cure should not succeed: Therefore seeing little of a remedy remains among Physitians, besides cutting of a vein, and purges: yet least Physitians should be made of no esteem, they now and then hand forth the lesser laxatives, that they may seem to have done something.

They confess indeed, and openly declare, that those lesser purgatives will not cut off a disease at the root (as if otherwise the greater laxatives would mow down diseases like a sith) but that they are diminishers of the peccant Humour, and for this cause to aid and assist: Suppose thou, if not unto the health, at least, unto the death of the sick, or the kitchen of the Physitian.

For Physitians do privily confess, that little aid is drawn from the pulse, beholding of the Urine, and the Blood; but that they have viewed the Urine, and Blood under *Gordonius's* Rules or deceitful Juggles, to wit, least they should seem to be less wise than their Predecessours; The which surely contain deceit, and pride covered with deceit: At leastwise, impure Physitians have taken up an invention for a man to be called, and distinguished by the name of *Dungs*.

To wit, a chole-rick, melancholy, phlegmatick person, which things they believe to be meer excrements: For it is certain, that by loosening Medicines the venal Blood and flesh are resolved into that yellow, and stinking putrefaction, without a separation of a diversity of kind.

And it is a dull argument to infer from thence, *If the blood, and flesh depart dissolved thorough the fundament, and they are made a yellow liquor, or muckie excrement; therefore the flesh, and blood do consist, and are composed of the same matters; which are true Choler, and Phlegm:* For truly except that the blood were not a true natural composed body, but essentially made up of many unlike parts, it could not also return again into Choler; from whence they say, the blood is composed, or otherwise there should be an immediate return from a privation to an habite: Therefore the Blood was never made even of Choler, and much less flesh; the which shall differ in the species from Choler: And by consequence, if the whole blood and flesh are sometimes transchanged into that putrefaction, (which they name Choler) and are ejected, and so the whole flesh meltereth as well by art, as through a disease: One of the two must needs be true; either that that putrified Choler is formally, and actually as yet blood, and flesh, or that that Choler being once dead, and transchanged in the birth of blood, hath again revived by an immediate return, as well from the melting of the flesh, as of the blood.

It must needs be I say, either that those four Humours do alwayes persist in their own proper forms, yet under the shape, and covering as well of flesh, as blood: or next, that those four Humours have put off their own Essence, and forms under their entrance of the form of blood, and flesh. If thou shalt say the first; Now the blood is not a natural composition, but made up of many things: But if thou wilt say the latter; an immediate return of blood, and flesh into Choler, or other their constitutive humours is impossible. Whence again it follows; That those things which are cast forth of the body by a laxative draught, are not Choler; but a stinking cadaverous or mortified liquor, being thus defiled by the force of the Medicine. For *Galen* seems to

PPPPPP

reject

reject both the Cholers, and Phlegm for the natural complexions of man, even so also to refer them into a meer distemper: For truly he saith, that one only hony in sanguine persons, is wholly turned into blood, the which in cholerick persons is totally changed into Choler: wherefore he banisheth the nativities of these kind of Humours, as without difference, not so much into an inclination of the matter, as into a vitious distemper of the Liver.

- 64 Whence it followes, that three distempers at least do alwayes; and at once flow together; every one of which do bring forth their own particular humours: Yea it is to be feared least *Galen* be dashed against the rocks, and being drowned, that he perisheth, while he teacheth, that blood being putrified, is wholly turned into Choler: For from thence he will be constrained to grant, that part of the blood is daily putrified in its constitution; Yea and that Hony in Cholerick persons, wholly putrifies within few hours; but not in sanguine ones: And that as well a Cholerick complexion, as the Choler thereof, are meer corruptions: At leastwise, as much of Choler as is daily made in sanguification; So much according to that precept of *Galen*, putrifies; And by consequence, Choler is not a constitutive Humour of sound and healthy blood; but a vitious adjacent thereof.

For while the blood being putrified (as *Galen* witnesseth) is turned into Choler, that Choler is understood to be true Choler, but not a putrified Being; seeing otherwise, putrified Choler is no more to be accounted Choler, than a putrified man, a man.

- 65 But after that I seemingly knew, that no Being existing in its perfection, testifies to the unlike parts of its own seminal root, if any should remaine; but that the seed disposeth of its own matter, that thereof, this some one thing may be made, and not by an apposition or adjoyning, but by a true formal transmutation; I afterwards perfectly knew also, that the diversity which sometimes shines forth in the corruption of the blood, can never attest, and much lesse shew forth the constitutive parts of the matter [whereof] no more, then a strangled Calf, although it be changed into Bees, is therefore composed of Bees; or hony, if together with *May* dew, it shall suffer a full moon in the grasse by night, is changed into Eeles; but with Rie bread, if it passeth over into Ants: But a womans Shift, being shut up with wheat, departs into Mice, within few days: Yet hony doth not therefore draw its matter from Eeles or Ants, a calf, his from Bees, or Mice their matter from flax and menstruous blood: And the Eele, Ant, &c. shall be so composed of hony, as again the Eele being dead, doth the second time exclude hony out of his body.

- 66 Therefore *Paracelsus* errs, who saith that a roasted Stork departs into a Serpent, and Ducks into Frogs, in fifteen daies space; because those birds were wont to be fed with those meates, and therefore that they ought feminally to containe those beasts in them: But that thing is altogether repugnant to the experience of the deed, and unto Philosophy: Truly the original of things, is not from those things whereinto things being resolved, are changed: Because that in natural generation, the constitutive parts ought so to be made some one thing, that they may be fully actuated by the one only form of the thing generated: And therefore, whatsoever under the relation of generation, is not changed from its former essence, that remains plainly excluded and unoccupied: For all natural things are constituted, almost after a single manner, and by a simple seed: so that although entire parts are composed, such as are bones and sinewes; yet those being bound together, not only in the method of connexion, but in the vital bond of a specificall union, do passe over into another family, and are a Being it self, from whence to fetch back the parts of the former seed, is altogether impossible to nature. The venal blood therefore is not a part co-weaved of four Humours, differing in an elementary species; and much lesse is the blood resolveable into those Humours from whence it is believed to have arisen: But by consequence, whatsoever is produced out of the blood, or through the paunch, by corrupting, that it is not one of those four feigned Humours; but a putrified excrement of the blood: Much lesse is there a ground of founding an argument for a possible existence of Humours.

- 67 Therefore it is cleerly manifest, that the Schools have not understood the blood, as a natural, single, and composed Being of nature; but for an artificial Being patcht together and connexed of many Beings: Under which ignorance it is certain that properties, requisites, health, diseases, and remedies also, have as one, remained hitherto unknown; and that by conjecture only, they have healed from false principles of healing. But go to yet, one only faculty of the Liver in sanguification shall regularly, directly and ordinarily

ordinarily produce four Humours at once, and the variety of these (from the example of hony mentioned by *Galen*) depends on a fourefold variety of one efficient.

Therefore it must needs, be that in one only Liver, a fourfold expresse complexional 68
dilemper is regularly and daily prevalent: to wit, every one whereof, against the will of its companion, is fit to frame its own Humour: And since he writes that more of Phlegm is ordinarily generated, and therefore also be determineth of a more abounding cause of a Quotidian ague; It follows, that the Phlegmatick complexion even of the most intemperate Cholerick person shall as yet be the more prevalent one: But seeing the fiction of Elements do long since cease, and have been suppressed, from whence the reflexion of a Quaternary of qualities, and Humours was to be hoped for; Now no reason shall henceforth remain, why it should rather incline to four Humours than to three, or unto ten, of whatsoever disposition that matter shall at length remain the heir; Because the fundamentall stem being taken away; to wit, that there are not, nor ever were four Elements in the universe, nor that our body is in any wise materially or efficiently constituted of the same; A fourfold generation of Humours in the Liver, doth also totally fall to the ground together with it: Because it is that which hath alwayes had respect unto the Elements, and the supposed and feigned qualities, and connexed strifes of these.

In the next place, how inconsiderate is this device of the Schools, that they will 69
have the Spleen to be the sink of black, and the worst of Choler, yet the Spleen to yield its assistance to the Liver, as indeed the Spleen doth administer the vicar-ship, as the Liver doth in making of blood, to wit, while the Liver is ill affected: As if in us, from a right of substitution, the vital faculty of the Liver should glister or grow in some other part, and especially on a sordid sheath, which they say is that of the worst calamities. *Good and most Holy Jesus, wilt thou as yet long admit of confusions of so great moment in healing? Have respect unto thy people groaning under so grosse falsities, and remember thy natural bounty.*

For the Schools see in artificial things, a chest that was compacted of diverse pieces, to 70
be again dissolved into its parts; and they from a childish stupidity have thought, that the same thing hath happened in nature through thy humanity: namely that Choler is fetcht out of the blood, yea, and out of the flesh also; and that Choler hath therefore always persisted under transchanged formal Beginnings; and that therefore out of Choler, the blood doth again materially arise, and re-arise.

But another hath seen salt to be resolved into water; nor to be then any longer seen, and presently by the boyling up of the water, that the salt doth again appear; They have therefore supposed the same thing to happen in their own feigned Humours: As if Choler being essentially unchanged, should be changed sometimes into blood, and at length into flesh, and at the pleasure of the Physitian, should by his solutive medicines, return safe from thence.

But let us come to the hand: Let the supposed yellow Choler be taken, that swims 71
on the blood let out of the veines, let it be boyled in whatsoever degree of warmth or heat thou wilt: yet there shall never be burnt, cankered, or leaky Choler made from thence, and much lesse, that sharp black Choler which they say doth Ferment earth:

The which, if it be made in the Spleen; therefore it is not a part of sanguification, or 72
of the blood: But if it be made in the Liver, with the other three, of the same similar matter of the Chyle, yet by diverse agents: for seeing that there are in the Liver, slender and most thin smal branches of veines, buisied in a continual transmission of urine, neither that the veines of the Liver have respect directly on the spleen; I see not how black Choler being seperated from the Liver, can be brought to the Spleen: Especially where great plenty of urine, and abundance of blood is carried upwards.

But both the Cholers ought with an opposite confusion to be carried downwards unto 73
their own Colledges apart, in so slender veines of the shop of sanguification: The Black Choler therefore which they call excrementitious, cannot be brought from the Liver; but rather the spleen is nourished by splenetick veines and arteries, according to the accustomed manner of other members: Neither doth the Spleen live by a banished excrement, neither is it a sink of the body, and of the worst Humour: For if the Spleen ought to draw black Choler from the Liver; why is it not near to the Liver? Why shall the Spleen alone among bowells, be nourished with an horride excrement? And whither at

length shall it drive this superfluous, pernicious superfluity? Shall now the sink of the last excrement be thorow the stomach, and the orifice thereof, which is so noble and sensible?

Shall this malignant liquour thus suggest an appetite to the stomach? For to what end shall a dross be re-cocted, having been already rejected in its whole kinde by banishment, and its properties? The stomach is granted to imitate the office of the heart; was it therefore convenient, that the stomach, and the enclosed food thereof, and thereby the whole family-administration of the whole body, should be daily defiled with the contagion of a malignant excrement? For were not that to have accused nature, and the Creatour, of unexcusable rashnesse from the beginning of the Creation? Had not some little bag been fitter for seperating of those dregs, if there were any Black Choler, than that the Noble Bowel of the Spleen bearing so many arteries, and the Noble Bowel of the stomach, should be made the refuges of the worst excrement?

74 But with what weapon do the Schools defend so great doatages? Truly they say; *That sometimes a black sharp juice is seen to be cast forth by vomite, the which falling on the earth, would lift up the same in manner of a ferment or leaven: Whence they have consequently gathered many absurdities.*

1. That that sharp or sour excrement ought from its Colour, to be called Melancholy or Black Choler.

2. That it is sometimes made from its own proper matter; yet oftentimes from Yellow Choler being re-cocted.

3. But it is not as yet known of whether matter, as neither the cook-rome of that dish; Since otherwise, Yellow Choler could not without confusion, be derived unto the strange Inn of the spleen.

4. That Choler which they will have to be the hottest of humours, and fiery, they say, is by cocture reduced into an earthy, cold, and dry Humour.

5. From a Watery and Yellow Humour, into a black one.

6. From most bitter Gaul, into a sharp and fermenting one.

7. Why therefore is Yellow Choler (Gaul I say) never recocted into black Choler, in its own little bag? Why doth it beg another port for this coction? Was there daily need of the re-cocting of Yellow Choler, if by re-cocting it hastens into a worse state? Why doth not nature, which alwayes of possible things makes that which is best, expell that Choler with the excrementitious filths of the Belly, which it changeth into worse by recoction?

But if the Spleen be the shop of Black Choler; it hath not daily so great heat, which may be sufficient for the roasting of Choler: or if it be hot how, of Yellow Choler which is hot, shall a cold humour be made? Especially since *Galen* will have hony, hearkening unto diverse distempers, to be changed into diverse Humours agreeable to those distempers? As though a liquid decoction should loose the virtues of sugar, and should put on opposite ones, because it is thickned into a syrupe or Lohoch. Wherefore hath Gaul hitherto, by what artifice soever it hath been recocted, never assumed a sharpnesse? For by wat way, or by what conductor, or enforcer, shall Yellow Choler, being exactly mixt with the blood, and Homogeneally co-arisen with it in the shop of the Liver, be brought unto the forreign vessel of the Spleen, that by roasting it may be made Black Choler in the same place, if it be proper to the Spleen to lay up a Black, and thick, cold, Earthy liquour?

For is the spleen for this end rich in so many Arteries, that it hath not a Bowel like unto it self, in so great a liveliness of pulses; to wit that it may coct Yellow Choler into Black, by defiling it? How shall Black Choler differ from Yellow, if be made [this something] by one poynt of heat? Is not that to commit the whole buisnesse of nature unto cocting heat, the formal properties being excluded? Shall there be room in the Spleen for forreign Choler sliding to it, if it hath elsewhere supplied its own necessities from the veines, and arteries? Where therefore shall the Choler comming unto it, be waited for in the entry and doores of the Spleen, if a gratefull guest hath already beset the house? Shall the Spleen bid farewell to the inbred blood of the veines, and arteries, that it may receive Choler comming unto it, into it self, to excoct it into a Black filth? What if Choler be said to be roasted in the veines themselves; seeing the heat of all the veines is only a moderate lukewarmth, shall there not of the fiery liquour of Choler, another cold one be made?

Neither is there any reason why the veines shall theeve away the services of sanguification from the Liver; Nor also, why it being first decocted Black in the veines, it should

should afterwards be brought unto the Spleen, as seeking for it self a new place of entertainment.

Neither at length, can the veines for this cause be concluded to be the Cocters of Yellow Choler into black. Lastly what is that fewel, which without a necessity may roast Yellow Choler, into another and worse excrement? For while I speak of the shops of nature, I know that nothing is moved by it self, nor that there are foolish heates, intended for no good end, as neither digestions proposed by nature her self, for ridiculous objects: For if there be a smal vein, whereby the spleen inspireth a digestive ferment, and vital vigour into the stomach, I see not why therefore so many fictions of Black Choler are convenient, from whence so many troops of calamities have followed in a chaine.

For how silly a thing is it, to have feigned the worst drosse of nature (as they confess 76 it to be) and a divorced and abhorred excrement, to be to the stomach for a delight? To cure its appetite? To render so Noble a part subject to the defiling as well of the powers of the meates as of the vital functions? For Black Choler which originally is prepared of the Chyle, is of the same particular kinde with that which is generated of burnt Choler (unlesse they had rather now also, to admit of a fifth Humour) or it is diverse from it.

If of the same species; Now the same [this something] shall be sharp, cold, and earthy, and shall be fiery bitter, and shall be made immediately out of diverse matters disposed unto their own diverse ends: And that by one only Elementary, simple, and not seminal agent: And Galen with his hony, shall be in a straight: And likewise, Yellow Choler from its own disposition, shall be subordinate unto Black Choler, as to a more perfect Being, by Elaboration; and so Yellow Choler shall not be one of the four, but a Semi or half-Humour.

But at least wise, I percieve not why a superfluous drosse should be dayly made, and ought to be of the constitutives of us; Or what dullnesse it is, which hath constrained them to feign so many fables? Truly however that page of healing be considered of, it is wholly without necessity rowled among dungs. There is indeed a sharp, vital, and spiritual Ferment in the Spleen, whereby the stomach cocteth: the which to wit, sayling, the appetite also goes to ruine: And therefore the old man saith; *That in Fevers, soure belchings comming suddenly upon burntish or stinking ones, is a good sign*: For it is the Ferment inspired by the Spleen, being the subject of a great title, and of a general use; in no wise to be dedicated unto a black balast, and melancholy excrement.

Paracelsus writeth, that man could have more commodiously wanted kidneys and a 77 Spleen; which besides his own Idiotisme, contains implicate blasphemy: For whatsoever God hath made, was and shall be always the best by far or most exceeding good.

1. But if the Schools had ever poured forth *Aqua fortis*, they had easily found that 78 sharpnesse dissolves earth, but not ferments it.

2. That the action of Ferments is one things having a co-resemblance.

3. That the earth is not Fermentable, because an Element is not to be Fermented by the Ferments of fruites, by reason of the constancy, and simplicity of it self: For if the leaven of bread-making doth not Ferment woods, or stones, what Ferment for the earth shall therefore be found?

For truly such is the condition of Ferments (not considered by the Schools), that a Ferment from the time that it is once recieved, it continually fermenteth further, neither doth it cease as long as it findeth an Object co-like unto it self: Wherefore the Elements indeed, do conceive the strange Ferments of fruits; but are in no wise therefore, fermented by the same; Because all Ferments are unsuitable to the Elements; Because they want transmutation, and seeds suited to themselves.

Otherwise, if the Earth were fermentable, dead carcases could not be in-humed, but that presently the Globe of the Earth would be made destructive unto us with a deadly Gore.

4. Therefore Galen never knew these things, he never knew *Aqua fortis*, yea nor so much as Rose water, he never smelt out formal Ferments.

5. Neither doth Black Choler any way Ferment Earth, if it no where, and never were: Although dungs may boyle up through a dissolution made by sharp things. Furthermore of one only Bread and Water, Chyle is made.

79 If therefore in Bread and Water, a fourefold Humour in nature should lay hid; by the same right, every juice of Herbs ought always to be fourefold: which thing be it dreame. Let us grant therefore, that only of Bread and simple Water, the foure feigned Humours are made.

First of all, these Humours are not made seminally, and dispositively, of simple Elementary Water; therefore the Chyle shall be made of the bread being resolved, and of this only; and this Chyle shall be afterwards changed into four Humours, by the priviledge of the acting Liver.

80 And therefore now an exorbitant and irregular Liver: For truly of every natural agent, there is only a single and simple action: It must needs be therefore, that either in the Liver there are foure agents of sanguification at once, or that the quaternary of Humours rusheth into feigned dungs.

For if four Humours are not made out of the simplicity of the aforesaid Chyle, of natures own accord, neither from the power of a fourfold agent co-labouring in the Liver; or if the supposed Quadruplicity of feigned Humours, be not made by a power or faculty of the agent, or patient; Truly whatsoever is denied under a disjunction may be denied copulatively, by reason of the largeness of a negative.

81 Therefore I conclude; if from the connexion of a simple agent, and single matter, a vital action of sanguification proceedeth; Surely that action, as it shall be simple, so also it shall not be able to be the Mother of above one onely Humour.

But if we feign varieties of Humours to be in the blood, by reason of a diversity of Meates; Now an hundred Humours at least, shall be to be granted in the blood, from as many Meats being taken at once.

82 But the Schools will have it, that under the degree of one only digesting heat, many meates are changed into Chyle, and that through the government of the same heat, four Humours are always produced in the Liver: And that as well in the Swede, as in the Ethiopian.

At length, they confesse sanguification to be the proper workmanship of the Liver: But of the Spleen, only through inordinacy, and aide; although in the meantime, the Spleen be letted, and involved in dungs, about the coction of Yellow Choler into Black.

1. First of all, *Galen* goes to ruin with his Hony, the which he writeth to be wholly turned either into Blood or into Choler.

2. The generation of Humours proceeds not from an Elementary power.

3. We must not run back unto a vaine Quaternary of Humours.

4. Otherwise Bilification or making of Choler should be as naturall to the Liver, as its Sanguification or making of blood is.

5. The blood shall be nothing but a confused connexion of Humours, an irregular generation; but not a natural composure, but deprived of the necessities of agents, and ends: Truly on both sides, great trifles do involve great cares, and great absurdities: The which, if they put on obstinacy, they now nourish madnesse, if not also malice: The trifles of Humours therefore being invented by the evil spirit, were derived into *Pagans*, and hitherto subscribed by the Schools.

For they were fit for the Devil, because they contain confusions in healing, fallacies and lyes; and therefore they produce dayly deaths, they obscure the light of nature, they presuppose plausible fictions, and are destitute of all examples from their like; and by so much the more dry, stupid, dangerous, and rash, those fables are, by how much they are the more toughly believed for the destruction of Mortals.

83 *Galen* therefore is wholly giddy, who affirms Hony to be totally turned, sometimes into blood, and sometimes into Choler.

1. First a messenger hath been wanting unto this rash asserter, which might the more surely certifie him, what and how much was made from the totalnesse of Hony: And so he is wholly suspected of rashnesse and a fiction.

2. Truth is wanting to the affirmer: For truly in nature, Choler failes, and therefore also a Cholerick complexion.

3. For he who throughout his great volumes, attributes the properties of the members unto Elementary qualities alone, constantly writes that a quaternary or fourfold number of Humours are framed onely by the actual heat of one Liver, in one onely

ly action of Sanguification; When as notwithstanding actual heat cannot but be simple in one onely member, at one and the same time.

Let *Galen* therefore learn to dream more truly concerning Hony, and Sanguification: Neither let him depart unto childish principles, by believing, that four conquering and contrary complexions of Elements do remaine at once in the Liver, every one whereof formeth to it self its own Humour out of the single or simple Chyle, which is connexible into the one only Subject of blood, and falling down from thence at the pleasure of a loosening medicine: Let him therefore desist from believing, that Humours are made to vary out of one only Hony or Chyle, by reason of heat alone, and that a simple one; seeing that wretched Prince of medicine doth not consider, that hereby there is required in a temperate heat of the Liver, as many heats at once (for so many Humours) diverse in making warm, from the supposition of their Being.

Take notice my Companions, that we are in no wise constrained unto the fiction of four Humours: For those things which are voided forth in the Flux, the disease called Choler, and dreggishnesses of vomits, are not Humours boasted of by the Schooles; but they are excrements which the revenging disease frameth, and expelleth; even as those which laxative medicines do eject, are the corruptions of sound or entire blood: And that which the revenging disease there acteth; That the Laxative medicine here executes, indeed with much brevity: For neither is the gate of diseases shut by the feigned perswasions of Humours; Since that, according to Philosophy, Those things are never drawn out of a transchanged Being, from whence it is naturally constituted in its making.

Moreover, although I have sufficiently proved elsewhere, that there are not four Elements, nor the combating congresse of the same for the framing of bodies which are believed to be mixt: And that it followes from thence, that there is not an unlike action of the Liver, in the alway procreation of four Humours: Yet whereby the Schools may see, with what a prop their whole foundation in healing is supported, I will treat from their own meer granted and delivered doctrine.

For truly, if the Elements do not with their Formes, remain in the mixt body; neither also could their properties remain therein; seeing the forms themselves are the immediate subject of inherency of their own properties: But if they had rather have the Elements to remaine with their formes, in the mixt body; Now even the formes of those Elements shall not be substantial acts, but only the bonds of the Elements: For they shall alway return entire, from every fore shaking of the supposed mixt bodies: To wit, the formes of the Elements shall soundly sleep so long as they shall have rule over the forme of the mixt body: Since therefore the Form of a mixt body is of necessity, a pure and simple ultimate act; it cannot be fourfold (yea although the material and remote principler of that matter should be the very actual Elements) and by consequence there is no reason of feigning a Quaternary of Humours, in respect of the agent: Because the action of sanguification is in no wise Elementary; but vital, and of the Ferment of the Liver: The every way simplicity whereof, could not finally respect a quaternion of Humours to arise out of an uniform, and most exactly united Chyle: So that although there were in a mixt body, twenty Elements, there should not therefore be as many necessary productions of Humours.

It is therefore a blockish speculation, and of a divelish perswasion, which saith, that of three Elements never concurring unto the mixture of bodies, four Humours in number, ought always and ordinarily to proceed, and that from thence, one only venal blood is regularly constituted:

To wit, that from thence, the necessities of curing and of diseases, are dictated. Perhaps they will object, thou admittest that the hurtfull cause is to be driven away, thou forbiddest laxative medicines, because they are poysonous, and indeed do withdraw the blood and vital strength: But from a Hungarian horse, they have learned the cuttings of a vein, from a bird, Clysters, &c. Therefore I may say truly with the Prophet: Do not ye become as the horse and mule, which have no understanding: Do not ye learn of such Masters: For the half part of the Continent will subscribe to my desire: Because under the Ottoman, Abyssine or *Ethiopian* Empires, and the chief part of the Indies, the cutting of a vein is unusual: Yet the strengths, nimble-

nimblenesses, readinesse, vigilancy of these nations, and constancy of their labours as well to do as to suffer, learn ye out of Histories: And ye will deservedly lament with me, that the Nations which in times past, were formidable in war, have at this day by degrees, under Physicians, become ready to dye, at every turning of the wind.

For the North, and West, which were wont to disperse their warriors into the whole world; do henceforth, by reason of these follies of the Schools, dye, as soon as the army is marched far from home.

88 Lastly they will object: If thou takest away universal succours, neither directest thy self unto the withdrawing of Humours; by what means therefore wilt thou overcome diseases? I answer with the aforesaid Nations, *that Nature is the Physitianesse of diseases, therefore that she is to be comforted, and not dejected: That there is need of a promotion of ends.*

For if excrementitious filths shall adhere unto the first dens or privy places of the Body; we must insist on resolving and cleansing medicines, nature being safely buied about the rest: But if something shall the more stubbornly and hiddenly remain in a more inward place of retirance; volatile Alkali salts are to be recieved, which cleanse away all things like Soap.

89 Surely it is a wonder, how much the Salt even of Tartar alone being made volatile, will not performe: For it scours all dregginesse, and stubbornnesse of obstructing filths, out of the veines, and disperseth the recieved assemblies or collections of Apostemes: Concerning this spirit of Salt (and not of the Oile) that saying of Paracelsus is true, *that whithersoever it shall not reach, scarce any other spirit of Salt shall more powerfully come.*

But external affects are cured as well by local applications, as by the internal aide of the vital powers: So that ye apply your selves unto a clarifying of the blood, and the tinctures and renewings of a new balsam by transpiration.

But the greater Arcanum's do after some sort, ascend unto the top of an universal Remedy.

Learn ye; *For God selleth Arts to Sweats.*

CHAP.

CHAP. II.

A second Supplementary Conception against
the fallacy of Humours.

1. The carelesse of Physitians is to be bewayled. 2. The mixture of Elements is rejected by the way. 3. Paganish ignorances are not to be winked at in Christians. 4. The doating delusions of a Catarrhe or rheume have sprung from Humours. 5. The wandering Keepers being unknown, Catarrhs were at length confirmed. 6. A quaternary of Humours is infringed by the confusion of a member. 7. Yellow Choler is battered with an Engine. 8. An unknown use of the Gaul is proved. 9. That Choler is not Gaul. 10. An absurdity of the Schools. 11. A Galenical error. 12. Pastime consequences of the argument of the Schools. 13. That the Schools through the sluggishnesse of a diligent search have been ignorant of the contents of the urine, and have neglected the signification of the urine. 14. The manifold errors of the Antients. 15. An argument from the rule of falshood. 16. A defect of the Schools. 17. The Choler shewn by the Schools is unto the blood by accident, but not of its essence. 18. Again by the supposition of falshood. 19. The Schools ought will they, nill they, to swallow down two Maxims of the Authour. 20. An error of the Schooles is again connivingly supposed. 21. It is again supposed. 22. Some absurd and shamefull particulars are proposed. 23. The covered blasphemy of the Schools. 24. The Gaul, a vital bowel. 25. That the Pagans were not enlightened with the gift of healing. 26. That snivel is neither phlegm, as neither an excrement of the Brain.

But indeed the number of Humours is so deeply rooted, that it is not sufficient, once to have refuted the same: And so, seeing that is not sufficiently taught which is not sufficiently learned, I am constrained to repeat by way of a second conception, what things I have already above attempted to demonstrate at large: For truly, the whole square of healing is conversant in this thing.

For I have very often wondred, that the fight of the Elements, the fictions of mixtures and complexions, have befooled the Christian world for so many ages hitherto, and that none hath taken notice of the falshood of these: When as notwithstanding, thy own affairs are concerned, while every ones special friend, or near neighbour his house is on fire: And by so much the more destructively hath this blindness continued, Since Physitians introduced all their own things into medicinal affairs: For by these devices, they have transferred the whole family of diseases, and the curings of these, into their own trifles; the credulity of Mortals assenting hereunto: In themselves indeed they were plainly ridiculous, and Comedial, but that they daily filled the people of Christ by whole streets and villages, with tears, mourning, wailing, and compassion on the miserable, destroyed families, and produced Widowes and Orphans without punishment.

In the next place, unto these asoraid and blind rashnesses of Physitians, they have feigned as many Humours; to wit, according to a Quaternary number of Elements: Indeed that in a disproportion of these, perhaps all diseases did consist; as also, consequently, their cure, from the abundance of those supposed Humours being sequestred: at length, that the renewing and preserving of health (however shortnesse of life, the asoraid sequestration of Humours and blood should cause) was recovered. A cruel received opinion, and ungracious wickednesse of the Schools of Physitians! Therefore I have not always seriously enough detested the passive deceipts of the credulous, and per-

icious inventions of the Schools, and next the continued sluggishnesses in subscribing, even unto amazement, and frequent sighs, and complained to my Lord Jesus, that mankind hath under the fraudulent wiles of the Devil, with so great rashness of belief, prostrated it self unto so stubborn and barbarous cruelty, and that it doth alike constantly subject it self even unto this day: Especially, when as in the more external things, these kind of trifles could find no fewel: I therefore begged of the clementious Parent of nature, that he would vouchsafe to raise up some one, whose gift might be, to refell so great dullness of mortals and of the Schools: For first of all it was certainly manifested unto me, from so great and so constant blindness, that we mortals are plainly not wise as to any thing of worth, nor that we do favour any thing, nor so much as in natural things, unless the hand of the Almighty doth enlighten us from above, by his pillar of fire, in so great a night of darkness.

- 2 For truly, first of all, the existence of Elementary fire nigh the Globe of the Moon, exceeding the Region of the Aire in its Sphere by many degrees, contains altogether a childish fiction in it: and by so much the more impossible a one, because fire, to wit, being called or sent for, or voluntarily descending contrary to the proper rule of its own supposed lightness, should from thence incessantly pierce through so many hundred miles, and through the most cold climate of the aire, and so is violently co-mixed with the aire, and a peace being entered into, and covenants stricken with each other, that fire, and Aire should violently descend downwards together, from a far distance, at the commands of all particular seeds, and constitutions of mixtures, being new, and also unwonted, at every moment. Surely it is to be grieved at, and exceedingly to be pitied, that such diabolical lyes, which in Aristotle were to be smiled and connived at, do for so many ages, even to this day persevere, and that they have not yet ceased, and that not any one hath as yet risen up, who is not a patron unto so great blindness: The which notwithstanding, cannot be covered with any conception, with any belief, nor with any garment of truth; Especially, because that from these leading fables of the Schools, four Humours might seem of their own nature to be devised, yea and also constrained to obey, and consent to the offices, and likewise to the properties of mixtures, and skirmishes, and to contain the intestine or inward hope, and rules of death, diseases, as also of health: Which things notwithstanding, have not stood believed (God the Creatour so permitting it) as the ordained principles of nature, but by the inbred hatred and suggestion of the Devil, and through a continued sluggishness of the schooles in subscribing: Against all which one only argument ought to suffice; to wit, that I have removed the fire out of the number of Elements, yea and the account of substances, and have demonstrated a co-mixture of Elements requisite for the constitution of bodies (which are believed to be mixt) to be impossible; So as that, none of a sound mind can, or ought henceforward to admit of a necessitated equality of Humours with the Elements: For the fallacy of Humours as well as of Elements, hath been the more hidden or obscure, and lesse passable in the people, but that it hath been consented to by Learned and judicious men, is to be had in compassion due to ones neighbour; the which, as it blowes away the credulities of the people, so it accuseth the dullness of the Schools and their constant sluggishness or carelessness of diligently searching.

- 4 But because the mad toy of a Catarrhe, hath likewise wondrously afflicted the world, and I having often searched with my self into the occasions, to wit, from what fountain so great an hereditary blindness of the Schools, and so inveterate an obstinacy in affirming, might proceed; at length I knew that the Ignorance of both the erring or wandring Creepers had given an occasion of sliding into the miserable, and subscribed a confession of Humours falling down.

- 5 For truly, any one being oft-times by the more cold aire, suddenly stricken in his throat, neck, teeth, or shoulders, he also as credulous supposeth, according to the assertions of Physitians, that believed Humours do flow down unto the places smitten with cold: When as otherwise, cold, as in its own nature it is repercussive, should rather divert the fall of Humours from it self, which are thought to be subservient to a Catarrh or rheum: But much blood-letting, and frequency of a solutive medicine at this day, as they diminish the strength of the parts, and dismiss it being diminished, on posterity; so its no wonder indeed, that the parts being smitten by the indrawing of an unjust aire, or otherwise with an excelling injury of cold, and being before weakened do easily suffer in the proper functions of their offices and digestions; to wit, that they do make manifest degenerate products, as the cause of the malady bred in the same

same place, but not defluxing thither from elsewhere: Although in the mean time, those strange products have nothing common with the four supposed Humours: and much lesse do they convince of a future flowing down of these: The falshood whereof notwithstanding, is of so great moment, that the position of the asserted Humours cannot but include a dullnesse and unconsiderateness of the Schools in their own principles of healing, with a most destructive abuse unto mortals, of necessity: Because that from thence, the art of healing, adisease, health, the necessity of life, and at length of death, do follow: The which therefore, I in this place, for the benefit of my decieved neighbours, will the second time more clearly explain: But at first, I will retake the position of the Schools, wherein they feign the blood to be composed of four diverse, and con-nexed Humours.

For we see, after the contusion or bruising of a member, first a swelling followes, which presently, for the most part looks red, and afterward is changed of an Azure colour, straightway after it looks black and blew, afterwards it is black, and last of all it waxeth yellow, and is largely dispersed into Circles: Therefore according to the Humourists, that blood first passeth over into black Choler, and this at length into yellow Choler: And so the more liquid Humour should the more stubbornly resist, and black Choler should be of a far more easie dispersing than yellow Choler: And so black Choler should not be made of Yellow: but plainly a after retrograde manner, this should be changed into yellow Choler; which is against the will of *Galen*, who never knew black Choler to be returned into yellow.

But rather (he writeth) that all the blood doth by its alienations, immediately and naturally contend into yellow Choler: Hitherto hath the unheard of doctrine of Fevers, in the Chap. of solutive medicines, regard: To wit, where I have shewn, that the blood of the veins is through its corruption, diversly transchanged according to the poyson of the solutive medicines: For truly that thing happeneth in bruises; and blood being chased out of the veins, and by degrees made destitute of the fellowship of life, doth by little and little also hearken as well to the affects of the parts, as to the various corruptions of the blood: But not that the variety of dead excrements, or unlikenesse of corruption, can, or ought to testifie a composition of the blood.

Yea truly, the Schools suppose for the institutions of medicine, that yellow Choler is one of the four constitutive Humours of the blood, to wit, a gawly and bitter one: and therefore, that that Yellow and bitterish Humour which is sometimes rejected by vomit, is Choler it selfe, yea Gaul it self, and essentially co-incident in identity or samelimesse with the aforesaid Choler, and original Gaul; both which they contend to be daily framed out of the meats at the constitution of the blood: To wit, Choler for the composition of the blood; but Gawl to be banished as an excrement, under the Liver, into its own sheath, that it may from thence go forth through the filths of the paunch: But that which is rejected by vomit, is yellow, bitter, sometimes Lecky, and of a cankered colour.

From hence indeed they prove, that that very original Choler which swims on the blood that is let out of the veins, ought (will they, nill they) to be naturally bitter, and Gauly; and again on the other hand, with a scantinesse of truth, that the constitutive Choler of the blood ought of necessity to be bitter: And moreover, although that bitter excrement, and which is rejected by vomit, doth altogether differ from the Choler left in the blood after its separation from thence, by reason (as they say) of its abundance, excesse, and meernesse, attained in seperating; yet in the essential and actual truth of the thing, they will have it to be the same; to wit, as well that which is rejected by vomit, and that which is as yet left for the composition, and requisite integrity of the blood, as that third, which redounding from the daily food, is brought unto the little bag of the Gaul, and from thence (they say) to be carried forth, for the tinging of the excrements, as well of the belly as bladder: The which to wit, they seriously affirm to be one and the same Choler, and meer single yellow Choler; and Choler I say, to be one only Humour in its root, of the four constitutive Humours of us: In which recieved opinion of the Schools, that a destructive decieving of mortals is contained, I thus prove.

For first, it is manifest, that that which is contained in the chest of the Gaul, is not an excrement of man, bred from the errour of the Liver, and ordained instead of a spur, for the pricking of the bowels: but that it is a Noble bowel resembling the condition of a balsame, and so exceeding necessary, that it is not lawfull so much as for fishes to live without a Gaul, although living sparingly of meer water; when as notwithstanding birds which drink, do live happily without kidneys, bladder, and the emunctories of urine: The which I have elsewhere profesly in the treatise concerning digestions, and likewise concerning the commands of the Spleen, and Gaul, sufficiently, and unto

the full satisfaction of opposers, demonstrated; whither let the Reader have recourse.

9 In the next place, that that which the Stomach re-gorgeth by vomit, is not Gaul, shall be elsewhere professedly demonstrated: Be it sufficient here, that the Stomach is an Inne unaccustomed to, and impossible for the sequestration of the Gaul; since the Gaul is not recalled unto the Stomach, from the Liver, and much lesse from its own chest: Which thing indeed fights with the Schools, who will, that the Gaul doth by a direct, and appointed motion, and pipe, dismisse its own exorbitancy through the Bowels, and that from thence the liquid dung of the same is tinged.

10 And then, there is not a passage, whereby the Gaul may by a retrograde motion, be drawn from the Liver into the Stomach: If it being made by the Liver, be naturally brought unto the Chest of the Gaul, it be now separated, and rejected as unprofitable, and from thence at length be driven forward through the intestines, to be mixt with the dungs: For the Stomach draws not unto it self, the excrement from the intestines: Therefore if that bitter and yellow matter which vomiting casts up through the Stomach, should be Gaul, after that (I suppose according to the traditions of the Schools) it had been generated in the Liver, and dismissed unto the little bag of the Gaul, and from thence become banished into the Bowel, it should be again attracted upwards unto the Stomach: And the Stomach should erre from its natural due, and wonted end; Which thing professedly more at large elsewhere. Now I will sift another equal impertinency.

11 The Schools will have the Gaul to be ordinarily, as it were an unprofitable excrement, and because it is not co-mixed with the blood as an entire part, that it is by the Liver, not presently indeed, but for some houres after that the Gaul is mixed into its own little bag, and also admixed with the dung in the Bowels, drawn upwards through the veins of the Mesentery, that it may be mixed with the urine: For saith Galen, *I behold the body of my urine late in the morning, to be plainly watery and not tinged; wherefore I sleep upon it, and I see my urine to be then tinged*: Therefore either the urine is of its own accord tinged only by a continued luke-warmth, or (even as the Schools teach) the tinging Gaul is at length co-mixed with it after some hours: Therefore from hence it is manifest; that they will have the Gaul to be presently again laid aside by its own little bag, through the Bowels, about the end of digestions, and that coming down about the utmost part of Ileon, it is attracted into the veins of the Mesentery, is sucked through the port-vein of the Liver, is sent inwards within the Liver, and hollow vein, and that it slides through the sucking veins into the kidneys with the urine; which circle of the Gaul, from the Liver into the Liver, is so full of infamous ignorance, that nothing is alike infamous.

12 For truly, 1. It is manifest: That the yellownesse of the urine is not from the Gaul, nor bitter.

2. That if Gaul should be made in the Liver, and not in the very Bowel of its own little bag, it might more readily depart from the Liver into the kidneys, than that, contrary to all comeliness of nature, that should be fetcht back from dungs which had been once rejected and banished: For there was never Gaul, or Choler in the nature of things, or in the Inne of the kidneys: And that which is made by an erring Stomach, and rejected bitter, was never Gaul, or Choler; but the meer superfluity or excrement thereof: And therefore the bitterness of Choler is in no wise rightly inferred from the bitterness of foreign filths.

13 3. The bitterness of Choler in the urine is not sufficiently proved, not the least thing whereof was ever true: None of the Physitians of so many ages, hath hitherto found the urine to be bitter in tast, or durst to assert it, unlesse in subscribing to paganish fictions; neither hath any of them ever dared to tast down any drop of the liquor swimming on the blood let out the of veins; but they had all of them rather universally to subscribe unto paganish fables: Neither have they in the least doubted, but that, that super-swimming liquor, was meer Gauly, yellow, and bitter Choler: Neither have they attempted to know whether there were any bitterness of Gaul or feigned Choler in the urine, no not so much as in the urine of those that have the Jaundise: The which notwithstanding should be most true and unexcusable, if but even one only drop of Gaul should be mixed with three pints of urine: But if any one hath ever by chance, or willingly, tasted down urine, or the aforesaid liquor swimming on the blood, and hath not repented him of the mixture of Choler, and necessity of Gaul: Now he hath given a testimony of his own obstinacy, and ignorance: For every Gauly Humour is al-

ways

ways naturally bitter : but neither is that super-swimming liquor, as neither the urine, bitter : Therefore they are not Gauly Humours : Therefore from the carelessness of tryall, they have been rather willing to subscribe to fables, and to believe falsehoods for truths, and flily to defend them, than to forsake that accustomed opinion : But all posterity lamenteth the effects proceeding from thence, and the whole Christian world with me bewayleth them even to this day : Therefore let one at least make tryal of what things I have spoken, and the which he shall presently be able to experience without discommodity or danger, and every good or honest man will grieve at the so great ignorance, and sluggishness of so many ages, and the cruel passive decieving of the people of Christ.

That therefore, which the Schools call yellow Choler, as well in the urine, as in the composition of the blood, is neither Choler, nor bitter, nor Gaul, nor therefore one of the four feigned Humours, nor answering to the Element of fire; seeing that fire is no way an Element : And it hath not hitherto been known, what tast one of those four supposed Humours might have : Yea as oft as they accuse Cholerick Humours, the bloody flux, Anthonies fire, &c, although the mouth might sometimes be bitter, yet the liquor issuing from an Erisipelas, is not bitter, but plainly of sharp, is become salt : That Humour I say, of whose burning heat, the Schools complain in an Erisipelas, is called a most sharp one; when as in the mean time, it bears neither any sharpness, nor bitterness before it : And they are unconstant in this; when as notwithstanding, the sharpness of Humours, ought to differ as much from their bitterness, as Pepper doth from Coloquintida, or from wild Cucumber.

And so the Schools have treated thus carelessly and unconstantly, concerning the properties of their own Choler; Because in Law, a varying witness is unworthy of any credit, he is accounted for an unfavoury or foolish, or false witness, and he is constrained to restitution, by how much hurt he hath brought unto another by his testimony.

But come on then, let us suppose (but not believe) that the liquor swimming on the blood, is Gauly Choler, and of the natural composition thereof; At leastwise, that blood on which that Choler now swims should be no longer blood; if one of its four constitutive parts hath failed it, and there be made a separation of the Marriage bed; to wit, a real separation of things composing : for Cheese, from which the Wheyness is withdrawn, is no longer Milk : For neither do I deny that the whole entire body subsisteth from an union of Heterogeneous parts: but the integrity of the former composed body ceaseth asoon as one of its constitutive parts hath retired.

The Schools indeed suppose a permanency, and co-knitting of four Humours for the constitution of the blood : Yea besides this simple and vain supposition, nothing hath been hitherto proved by the Schools, which may not be more worthy of pity than credit : Therefore I deny their blockish supposition, not proved, to proceed unto the false derivations of Choler, and embassages of these, into the diverse parts, and passions of the body : If they shall not first make it manifest concerning the question, whether there be any Choler requisite for the constitution of the blood.

Therefore Choler hath not place in the constitution of the blood, although a urinary wheyness swim upon blood let out of the veins : For that wheyness is unto the blood by accident; which thing the blood of those who have drunk little, and laboured and sweat much, doth sufficiently prove : For oft-times the blood of such being taken away by Phlebotomy, wholly wants all Wheyness : And by consequence, it should be deprived of Choler : And likewise, neither doth that blood cease to be blood, the which doth not admit of Wheyness, but by accident : The which I have in the Chap. of the Liquor Latex (hitherto unknown to the Schools) concerning the rise of medicine, elsewhere demonstrated : For the Latex is left in the blood for its own ends; the ignorance whereof therefore, hath hitherto secluded Physicians from the signification of the urine, and the knowledge of many diseases.

I will therefore re-sume by supposing; That yellow Choler is naturally a watery liquor swimming on the blood : Let the Schooles therefore, at least reach, if Choler be an Humour most fiery, representing fire, and containing it in substance and properties, how fire can glister in a meer salt water? How is it, that it is not stifled in that water? After what manner do fire, and water co-suffer with each other under the sameness of unity, as also the air immediately under Phlegm? What have they any where found in nature, which may constrain fire to conjoyn in salt water? They will finde at length, that they

are driven to believe these trifles, by reason of a Quaternary of Elements, and a necessity of mixed bodies: Both which, after they have been oppressed by demonstrations [*propter quid*] or for what cause, the world will sue for my writings: The very Schools themselves and all posterity will laugh at the blockishnesses of Ancestours, which have hitherto been so stubbornly defended, they being so pernicious in healing, and false in instructing.

19 Because, will they, nill they, they ought to swallow two Maxims of mine, elsewhere demonstrated: One whereof is: *That there is no Element of fire, and that kitchen or artificial fire, is not a substance*: And consequently, that if more things than one should concur unto the composition of the blood: at least wise that four Elements could not flow together thereunto: And therefore, that the fiction of four Humours doth badly square for our blood, for mixture, tempering, strife, and likewise for the truth, existence, actuality, diversity, and healing of diseases and cures: But the other of my Maxims is elsewhere sufficiently proved: *That every sublunary visible Body, is not materially composed of four, as neither of three co-mixed Elements*. They must therefore seriously repent: Because the fire, is neither an Element, as neither a substance, neither is a salt watery liquor to be called into the composition of us, for the feigned comparison of a Microcosme or little world, that it may represent the form of fire.

20 Again, I by way of connivance suppose: That nature scarce makes enough blood of all the food, dayly (even as in the book of the unheard of doctrine of Fevers); At least wise, nature approves of that, since she hath hitherto appoynted no place of entertainment for superabounding blood: Yet she alwayes prepares out of all food, both Cholers, abundantly and super-fluouly (which the Schools prove by the tincture of the urine, and filth of the belly) therefore at least wise the nature of the Liver daily erreth, and is founded in error, and offends also in abstinent persons, fishes, and Nations that are satisfied with the drinking of water only; Because indeed, it generates the least of a super-abounding fiery, and earthy humour, and yet more than it hath need of for its own nourishments: Why therefore, doth not nature offend rather in quality, even as she daily without distinction, offends in quantity? Why also in the place of blood (to wit, the fourth ordinary Humour) doth she not likewise in offending, produce a certain abortive excrementitious blood, to be sent away into banishment, as she daily, actually banisheth the two excessive Cholers out of the composition of the blood, and fellowship of life?

Why also doth she daily bring forth more of malignant humours (and those to be expelled) out of good and much juicy meats moderately taken, than out of the best blood? Since, as *Galen* is witness, in hot natures, hony (which other wise, in temperate, and therefore in Sanguine persons is totally turned into blood) is wholly turned into yellow Choler? To wit, its other three companional Humours being excluded? Whence it followes: That the framing of Humours proceeds not from the complexion of the food, but altogether from the condition of the Liver.

21 From whence consequently, if more of both Cholers than is meet, be daily made, that all that is to be attributed unto the offence and vice of nature: And therefore that every naturall complexion of the Liver is vicious and erroneous in all and in every thing. In abstinent, and likewise in dry parched persons, as also in bloodless, and in Feverish ones, there is daily an offence committed in the excess of either Choler, as also, in the penury of blood: Whence it follows, that the primary and principal scope of nature is conuersant about the framing of both the aforesaid excrementitious Cholers. Who therefore from so many absurdities, shall not see and discern the falshood of the supposed position?

22 I therefore supposed further, that the Schooles teach black Choler to be sharp: But they prove that, because it being rejected by vomit, and falling on the earth, if it be over-covered with Earth, it ferments it: The foundation of this blockish argument I have already above oppressed. Secondly they teach, that black Choler is now and then made of yellow Choler being re-cocted, or abundantly cocted; as if yellow Choler did at length, of its own free accord, flow down into black, as it were its ultimate end: which positions of the Schools, many absurdities do accompany.

For first of all, the Schools contradict themselves in this, that they determine four Humours, and also those to be bred or made by the same motion of digestion; to wit, if the composition of the blood doth happen from four Humours being conjoynd. Secondly, they struggle with themselves, while they teach, that yellow Choler in cocting, is terminated

terminated into a Lecky and Cankery Choler: That is, to put on a green Colour, and in the mean time, to increase in bitterness.

Therefore black Choler is not sharp from an overcocting of yellow Choler, neither doth that arise from this: else, either the coction of nature is not single in the same body, and promoted by the same ruler of digestion; or surely, that which is rejected, being sometimes sharp and black, is not black Choler: Unlesse that perhaps both may be alike deservedly denied: And then, where, and after what manner, shall yellow Choler be overcocted? For not in the Liver, where the slender little veins do not undergo the delay of cocting; to wit, they being filled with continual blood, and urine passing thorow them.

Neither in the next place, shall black Choler be made of yellow Choler re-cocted in the veins of the mesentry; seeing these are continually extended with sucking of the meats, and with the passing of drinks thorow them; and the recoction of yellow Choler should not only be for an impediment; but moreover, for a contagion to the fresh Chyle tending unto the shop of Sanguification: But if indeed yellow Choler be recocted neither beneath, nor above the Liver, nor at length in the little branches themselves of the Liver, that from thence it may be made black Choler; but yellow Choler be brought to the Spleen, that in that Bowel, a transmutation of yellow Choler into black, and of bitter into sharp, may happen; then at leastwise, they ought to have remembred, that that being granted, now black Choler, or a fourth Humour should fail for the Composition of the blood, and that the blood should be only composed of the other three: Which thing utterly overthrows the position of the sanguification of the Schools.

At length, to what end shall the recocting of yellow Choler into black serve? If an hostile Element and earthy, sayling in the blood, should a while after arise from thence? Is nature so greatly buisied in preparing of Humours that are forthwith to be banished? And the which a little after, I shall shew to be Non-beings? Meer fictions designed to no end? Next, by what means shall yellow Choler draw that sharpnesse to it self, from bitterness, they being hostile qualities unto all bowels, out of stomach? If it directly passeth over into an ordinary and natural Humour? How shall a fiery Humour, through a delay of coction, assume the heat of cankered rust, especially under the same slow and vital lukewarmth? And shall be made a black, sharp, and Earthy dreg? Is therefore perhaps, Earth materially bred of a fiery Water being re-cocted? In what part of the world also doth a sharp thing proceed from a bitter thing being thickned? And from whence have the Schools learned this feigned Metamorphosis? Is happily that sharp, black, and earthy Humour, a certain singular Humour, one of the four Elementary humours of the three Elements? But therefore it is false, that they have affirmed the same to be made of recocted, and burnt Choler.

Yea moreover, it is to be feared, least it be to be called a fifth Humour; which as yet hath not had another like unto it self, and that this shall be no lesse necessary than the other four, if they as yet dare to devise four other Humours: For truly this is a sharp one, unworthy of the family of Choler; The which is wholly spoiled of every property hereof; to wit, which is a sharp, grosse, black, thickned, re-cocted, cold, Earthy, and leaden Humour: But where have the Schools learned, to call Earth a black, sharp, cold, and dry fire, that they may begin a fourth and Elementary Humour requisite for the integrity and consistence of the blood? Consider Reader with pity whither the enfolded absurdity of a fiction hath driven the Schools, that through the penury or scantiness of names, and truth, they have made two Elements, and feigned Humours from thence, a cold Earth, and also, a bitter, sharp, soure, and fiery liquor? And that they have called it yellow Choler, and also, the same, presently, black, sharp, bitter and soure Choler? Alas! they may fear a deadly chance will befall them, since they have now proceeded in stumbling for so many ages, and in running away, so miserable lyed: But at leastwise, I conjecture, that this new branch of black Choler, hath not a sure assertion in the constant dulnesse of the Schools (the which I at first demonstrated to have been the nourishable blood of the Spleen, sometimes becoming degenerate through a sinister event) nor to be requisite from the beginning, and for the constitution of the blood: but that it is said to be produced from degenerate Choler, by re-coction, in stead of a privy shift; to wit, that they may after some sort, free themselves from so many perplexities of absurdities: At least wise, they are compelled rather to grant, that that black soure liquor, being now and then rejected through the vice of the Spleen, is an excrementious, unprofitable dreg, and not an Humour made from the intent of nature.

How-

However otherwise it is, if they say it issues forth from the intent of nature, (although that be the more rarely beheld) and not likewise from yellow Choler being first recocted; at least wise, it hath attained the undeserved name, and property (for neither do the Schools sufficiently explain themselves, they wandring in an unconstancy of their own recieved opinion) of Choler, which is of a fiery and Gawly property: Now earth shall sometimes be nothing besides fire being thickned, if the feigned Humours do fitly square with the Elements attributed unto them: Also yellow, and black Choler shall be made at once, and by the same agent of lukewarmth, that both Cholers may answer to one earth: Especially, seeing now it is manifest, that fire can no more be, than it is of the number of Elements.

But if indeed, three Humours are sufficient for three only Elements, why have they invented four? For that is to have been willing to compel nature according to the imagined errors of dreams; and through rashnesse already accustomed, to have confirmed heathenish follies, without the gift of the light of healing: But how will four square to three? The which if they do not square, let not, likewise, the Schools proceed henceforward, stubbornly to defend the paganism of the Antients: For truly, to be willing to cure by such lyes of pagans, is to have introduced a destructive and erroneous practise, unto ones own damnation, and the calamities of ones neighbour. If therefore black Choler appeareth not in the Liver to be remarkable by its properties; nor in the spleen, from yellow Choler being recocted, or from roasted Gaul; yea nor from a proper intention of nature, nor likewise, is a secondary nourishable Humour, certainly, there is no yellow, as neither any black Choler: Yea, if both Cholers be a daily Humour, and the constitutive parts of the blood; and likewise, if both Cholers are a daily superfluity designed unto their own sinkes: Therefore also, the dung shall by a like priviledge, be an excrement, not indeed of the meats, but of the blood, because it is tinged by yellow Choler.

But truly the offices of either Choler appointed by the Schools are too stupid: To wit, that nature shall of necessity, be alwaies diligently carefull for the generating of yellow Choler, for the tincture and bitternesse of the dung and urine (although this tast be wanting to them both) as also, for a spur of the avoyding or expulsive faculty. Again, to what end ought the stomach to have been spurred up by yesterdays black Choler, being first defiled with sharpness? For truly, the stomach is endowed nolesse with a proper expulsive faculty, than with an attractive, or retentive one: Why likewise doth black Choler (which from its own buttery is not only feigned to be bitter and sharp; but to be also perniciously soure) degenerate into soure, that it may inject a spur into the stomach? Since that which is soure, according to the Schools, rather bindes or restraines. Let it therefore shame judicious men to tell of yellow Choler and Gaul, and that it is required to be bitter for the tincture of the urine; seeing that in urine, there is never any bitternesse found.

And let it shame them, in a matter of so great moment, as is the Temple of the Holy spirit, to maintain these Cholers for the composing parts of the blood; And so, to have directed the government, and doctrine of non-beings, unto ends impossible to be true: For if as well the Gaul as the Spleen, are receptacles designed only for excrementitious filths; let them blush, while as they behold the Spleen alone, to have more arteries than all the Bowels together: And let them consider why there was need of so many Arteries for the sink of a most disgracefull superfluity.

23 And whether that be not to have accused the most glorious Authour of life, of error, who had given more of internal life unto one sink of filths, than to all the palaces of life being put together: And who hath commanded the heart continually and without ceasing to labour, that it may transmit sufficient spirits of life unto the Spleen, by perhaps four hundred Arteries: Had not otherwise, the Arbitrator of nature, better placed the life for more worthy uses? And therefore, he had commanded a little of black Choler to be bred and made (while as according to *Galen* concerning hony, these or those Humours do become few, or many, not from the complexion, and goodnesse of the meats, but from the endeavour of the Liver alone) and had endowed pernicious filths with a far more ample passage, and that far remote from a Noble bowel (For the Creator seemes to be accused by the Schools, as forgetfull of his ends) That as the Bowels do together, and at once, empty out their whole yesterdays fardle; so also that the Spleen might at one only turn, empty out its stuff, and preserve our body free from so great an enemy.

For if black Choler be an excrement; truly by how much the sooner and cleaner it is evacuated.

evacuated, by so much also, the better: Even as the bladder is not delighted with retained urine, as neither is the long gut delighted with excrementitious filths retained in it for a treasure: But they rejoyce to be freed from their fardle, at one only turn, and that with speed: Therefore the Schools by consequence, do wickedly accuse the Creator to be guilty, as that he was either ignorant of the aforesaid ends, or as passing them by, that he was unmindfull of them: Because he was he, who would have an hurtfull excrement daily to increase in abundance, to be plentifully brought from far, through the slender veins, by a retrograde motion, unto the opposite Spleen, and by a strict channel to be unloaded into the stomach; and least happily, the sink thereof should be hurt by its guest, he had appointed so many Arteries as chief over it, that the whole Spleen might shew forth nothing besides a folding together of Arteries.

Fie! let so great rashness of men depart. And indeed they alike equally doate concerning the Gaul; While they know not, that the very liquor of the Gaul is a vital bowel, no lesse than the membrane of the stomach, the very substance of the heart, or the marrowy substance of the brain are: And that thing, at least they ought to have learned out of *Tobiah*, as having long since perfectly taught it: For *Raphael* (which name of a spirit, sounds, the medicine of God) commanded the Gaul to be transported; but not the fish, which otherwise had readily putrified; But not the balsamical Gaul: The Gaul therefore, supplied the room of a balsam beyond the condition of the blood, flesh, carcase, bones of an ordinary bowel; Because it holds the stern of life in us: Even as elsewhere concerning digestions, and the use of the Gaul. Lastly they affirme a childish thing: That since a sufficient quantity, yea too much of Gaul for its own uses, is generated, nevertheless they bid that the very little bag of the Gaul do remain the treasural buttery of that excrement, to be always filled with that banished dreg: Whereas otherwise, if that should have the appearance of truth, the Gaul ought daily and speedily to be unloaded after the manner of the bladder, because it should rejoyce in its expulsion, but not always to swell by detaining it, unlesse it were a bowel.

Which due hastening of expulsion, and unburdening, since otherwise, it is not seen in the Gaul, as neither in the Spleen; it is for an undoubted sign, that the Gentiles have exposed their own fictions to sale, unto the credulous, and that they were not illuminated by the Giver of lights: And likewise that the Schools of the Gentiles do even unto this day, by their own followers, teach and believe hurtfull fables for the institutions of healing, and therefore that they do cruelly slip in their practise according to the deceitfull agreements of ages, after the same tenour as in times past: To wit, that four Humours, and meer non-beings, were never true, necessary, and existing: indeed, that the dreams of Ancestours, and their diligently taught fictions have remained subscribed unto, from the carelessness of a diligent search: Because the Schools in their doctrine concerning Humours, fail in the causes, original, tast, effect, end, sequestration, appropriation, as to the Elements, temperament, co-mixture, Elementary qualities, peculiar properties, and the whole necessities of nature and Philosophy. Surely in teaching a false art of healing, they have walked with a most damnable dullness, and do walk with the like shameful blindness at this day.

I have said little of Phlegm, for if I shall speak what they write of that, that it is daily most plentifully made, being mixed with the blood, and that at length it is changed into blood.

First, it is sufficient, that I have demonstrated the same to be the fibers of the blood, or the blood it self speedily hastening unto the bound of the digestion of the solid parts, and so that it hath now somewhat entered the threshold of a secondary nourishable Humour: Then next, that I have shewn, that trifles do voluntarily rush down with their own weight, while as now for that very cause, they take away their own quaternary of Humours, if Phlegm be blood beginning, or not yet sufficiently digested: But because the Schools for the most part, prove Phlegm by snivel, I will here speak something of this excrement; To wit, I will shew, that the Scholes are altogether ignorant of what the muck or Snivel is, while they define the same to be a Phlegmatick excrement of the brain, and a superfluous excrement of nature, and as if a superfluity, perhaps of so many ounces in one only day, were a necessary remainder from the blood received into the digestion of the brain: which particulars I have elsewhere professedly touched at, in the treatise concerning the Latex, and also of the erring keeper: So here I will only demonstrate them by the way.

For truly I have stood by, when as *Hellebor*, *Turbith*, *Tobacco*, &c. Were beaten, and presently I have sneezed diverse times, and my nostrils did not only drop down

plenty of waterish snivel, but also, of snorty snivel. Any old woman might presently think, that that snivel had not bewrayed it self, if I had not drawn up the flying dust of those things: Therefore it was not in the head before, but was made there; To wit, If the pipe were open, and yet it did not flow forth: If therefore, that salt snivel be the proper excrement of the Brain, it is the remainder of its secondary nourishment, being there left after the finished digestion of that part: But not that; For it had flown forth of its own accord, and without the odour of things, which it did not: Therefore it was made, not from the superfluity of the nourishment, but from the nourishment degenerating, or degenerated: After another manner, the brain hath an excrement after the manner of other solid parts, to wit, the which is dispersed into the encompassing aire, by an unperceivable transpiration: But the snivel allured forth by Tobacco, or other sneezing things, is plainly like to ordinary snivel; but that snivel which is violently stirred up, is not the excrement of the digestion of the brain; therefore neither is it the ordinary snivel: But it is speedily made, and that in very much quantity; yea and without a presently manifest hurting of the brain: otherwise, if it should degenerate through a defect of the digestive faculty, the head should of necessity also be ill at ease: But the consequence is false; therefore also the supposed antecedent. Therefore, there is another certain faculty, besides the ordinary and principal nourishing one of the Brain, which produceth such snivel at the meeting of the foreign and troublesome odour, powder, air, or obstruction internal unto it: The which surely differs very much, according to the varieties of that foreign thing meeting with the faculty: For a sign, that that faculty (which I name the keeper, being prefixed as well before the windpipe as the nostrills) being diversly affected by things encountering, it doth presently bring forth diverse snivels in its own Cabinets, out of the Masse of the Latex. But I admire, that none hath hitherto taken notice of these faculties, extended as well in the windpipe, as in the passage even unto the organ of smelling: but that by rudely passing over the whole, it is referred unto the phlegm of the Brain.

The Schools therefore bravely shew an hurtfull excrement of the Brain, begotten indeed by they know not what Parents: but they have not yet made manifest the essence, existence, or appearing thinglikenesse of phlegm, and of a fourth Humour, which they together with the rest, have erected for a pillar of medicinal affaires. I wish there may be another *Sampson*, who may dash the two pillars of Choler, and the one of phlegm, in pieces, and overthrow the appearing Palace, which the Evil spirit hath even hitherto prolonged, to the deciet of mortals.

CHAP.

CHAP. III.

The dissembled or feigned vomiting
of Choler.

1. The neat invention of four Humours. 2. They shew a false phlegm. 3. Choler hath remained undistinct. 4. An absurdity in black choler. 5. How they prove yellow choler. 6. What that bitter and yellow matter may be, which is cast forth by vomit. 7. From the handicraft operation of a calf. 8. That it is not Gaul which is cast out. 9. This bitter superfluity is bred from a fore-fold error. 10. A faulty argument of the Schools. 11. An objection, with a begging of the principle. 12. It is proved by a manifold argument, that it is not Gaul which a Ter-tian Ague casts up about its beginning. 13. That an hungry stomach draws not choler from the Gaul. 14. The chest of the Gaul wants an upper entrance. 15. The Gaul should not suffice all the fictions of the Schools. 16. That the reason of choler is not to be fecht from fire. 17. The absurd fiction whereunto they are compelled. 18. That fire cannot subsist without an actuall burning. 19. A priviledged Humour for the air, is feigned. 20. Some absurdities accompanying both the cholers. 21. Some absurdities accompanying phlegm. 22. VVhat that may be, which they imagine to be phlegm in the blood. 23. After what sort the Authour departs from the Schools herein.

The doctrine of Humours is too Antient, and firmly rooted, than that it can fall to the ground by Engines lightly assaulting it: Because men depart with difficulty from what they have been accustomed unto: The wart, the root of the evil, which hath been once pluckt off, it is to be feared least it spring again; especially that which hath already every where obtained a sprout: Because there will be those who knowing no better, shall see themselves as it were excluded from medicine, and through indignation, will shut the doores against truth knocking: Others, who have grown old in sluggishnesse, being unapt to learn better things, will despise others before themselves.

I will go against them: For indeed, when Physitians had seen the blood of the veins to be thickened into clots, they considered that there was a certain red liquour, and running, and also another, which in the beginning indeed flowed with the red liquour, but that it soon setled and clotted into a jelly, of its own accord: For such was the primitive inspection and Anatomy of the blood: It hath also been believed hitherto, that the blood is at least, that red and fluid liquour; And it hath been unknown, that although in the Meseraick veins, fibers, and the beginnings and rudiments of sperm or seedinesse were not yet obtained, yet that true obtained, not yet fibrous, was in the same place; because they might see the blood in the veins under the Liver, not to differ by way of colour, from the blood of the hollow vein above the Liver.

As soon therefore, as the ham of a virgin being let down into water, they let blood from her; they with joy observed, that the blood immediately tinged the water, and moreover, certain threddy fibers resembling as it were the liknesse of a cobweb; whence the Schools without delay, pronounced, that phlegm was now manifestly to be seen: And also our doctrine might be judged a brawling about a name, if a fiber did not appear after the death of the blood onely: For in a dead carcase also, long after the colds of death, the blood notwithstanding, remains un-coagulated in the veins, and therefore, so long is alive.

For milk hath not this phlegm, because in the separation of its heterogeneous parts, it hath Cheese and clots wherewith it is constrained: For I speak of milk, and blood, even as they are Beings existing entire in act, they being not separated through corruption: But the Schools behold the blood while it is now a dead carcase, being coagulated, neither properly while it is that any longer, the Etymology whereof, it hath as long as it floweth; No more then a dead man, is a man with an estranging particular.

- 3 They also presently added a third Humour to the blood, which should be the Gaul, nor that as yet, different from the Wheyie urine and sweat, and the Water accidentally swimming on the blood; neither have they heeded whether it were bitter, and whether from a deserved title, it possessed the properties of the Gaul or not: It hath been sufficient and pleasing to them, that it should be a watery liquor, or barely of a clayie colour.

For the law of founding the Gaul was in the pleasure of the Prince of Physicians; but not any longer of nature: He fell into the meditation of four Elements, yet a fourth Humour was wanting; wherefore, that their number might answer to the Elements, which were thought to be four, and to flow together, well nigh, unto every constitution of a body, a fourth Humour was seasonably devised, being therefore like unto earth, and black, the which while they long, in vain enquired into, they at length, by a proper and rash boldnesse, commanded it to proceed from a re-cooked fiery and Gaully liquor, so as that Choler, the name being retained, was commanded to degenerate from yellow into black, and from an invented fiery liquor, an earthy one proceeded.

- 4 And its bitternesse (for in live bodies they have commanded it to be presently scorched, roasted and fried at pleasure, with an equal importunity) being roasted into an adust Gaul, they have willed to assume a sharpness under the Lukewarmth of life; and so, of a fiery matter, a cold and earthy product to be immediately made by an act of the fire, and lukewarmth. The modern Schools in the mean time, kick against it at unawares, while as they accuse any distilled things of an heat borrowed from corruption of matter: For as the former feigned black Choler, which might fill up the number of Elements, they at length prosecuted it with all conjectures, although ridiculous ones.

- 5 For so, they introduced yellow Choler by the jaundise and bitter vomitings, for a foundation of nature, and art: Truly the liquor swimming on the blood let out of the veins, since it shewed forth no bitternesse at all, young beginners might even from thence have doubted of the nature of Gaul, if they had but once only lightly tasted a finger dipped therein: Wherefore when the Schools observed, that by vomit, yellow, and also bitter excrements were frequently cast out; yea that now and then they dissembled the juice of a Leek, of dissolved Verdigrease, or the infusion of an Azure stone, they determined of Choler more certainly than certainty it self.

Neither was it any longer to be disputed concerning it, as neither against him that denied such principles (but of the Choler of the Urine, I will by and by speak under the inspection of urine) and afterwards they boldly also affirmed, that Choler to be in the urine, in any dungs whatsoever, and also in the filths of the ears, and eyes: But the jaundise hath more fully confirmed this doctrine, because it is that, which overspreads the mouth and spittle with bitternesse, and stirs up the itching of a Citron-coloured skin.

Therefore it hath easily been believed, that all these same effects are borrowed from the Gaul: Yea, they have affirmed that all such diseases of the skin are from adust Gaul, and offending as wel in quantity as in quality, and from the ice of the Liver, in bringing forth more Gaul than is meet: To wit, by which circumstances, they have supposed, that they have sufficiently and over proved the existence, and necessary association of Choler: From hence afterwards, arose a dream which conjoynd those four Humours together, they remaying in their essence, and that from a co-heaping thereof, one only blood did from thence proceed, and that every humour did again rebound from the connexion and composure of the blood as oft as it should please an Elementary strife, to wit, a distemper, or at the pleasures of Laxative medicines.

- 6 I will now willingly declare, openly mine own, and those daily observations: For first of all, if the more plentiful, hard, and scarce sufficiently chewed meat be taken at

at supper; on the morning following, yellow vomiting, and bitter, in the shew of yolk of eggs, or otherwise, like Oyl pressed out of the seed of Rape roots, frequently succeedeth: From thence therefore, first, I conjectured, that that was through an error of the digestion of the Stomach; but not from a vice of the Liver, from a defect of Sanguification, or the making of an abundance of Choler: For truly oftentimes, meats badly digested and chewed, being partly turned into an yellow balast, are beheld to be cast up together with the same vomit.

And then, I conjectured, that the rules of Sanguification standing, those yellow and bitter excrements, were neither Choler, nor Gaul, and much lesse a constitutive part of the blood: Because they were neither as yet slidden of the Stomach, nor therefore experienced in the Sanguification of the Liver, but through a long delay, and the small veins of those of the mesentery.

Wherefore likewise, that neither was there a passage from the Liver unto the Stomach, but by the same passages, being very remote, and impossible to be believed: Especially, while as the badly withdrawn meats are seen to come forth whole, together with the yellow and bitter vomiting. Furthermore, I learned by the example of a Calf, and ocular inspection, that this yellow rubbish was generated in a Stomach being badly disposed; and more regularly in the gut *Duodenum*, in temperate bruit beasts: Seeing also, that the suckings of Milk recieved, do wax yellow in the gut *Ileon*: For a Calf drinking only his mothers Milk, sheweth, presently after death, that the Milk presently clots into a sharpish curd, and watery acide liquor; both of them being much desired for the making of Cheeses: This curdy runnet I say, presently after, layes aside the whitenesse of Milk in the Stomach, becomes brown, and in the *Duodenum*, and beginning of the *Ileon*, waxeth yellowish; afterwards in its progresse it is more fully yellow, but further, it is plainly made of a Citron colour; but about the blind gut it waxeth greenish: Last of all it becomes dungy. Let the Schooles therefore shew, whether those colours are made from a yellow and Lecky Choler? While as in the meantime, they are so changed before their coming into the Liver? Or whether indeed, these colours are made from the property of the Bowels?

In like manner, infants having sucked Milk, do presently cackya Citron coloured excrement, and thou wouldst call it meer Gaul, and the Schools are constrained to confesse, that all little infants are at their first beginning, more cholerick than men themselves; whom notwithstanding, their age, food of milk, small heat, continual sleeping, and want of exercise, do excuse from the suspicion of Choler: But if the infant suffers gripes, or the symptoms of sharpnesses, by and by after, the same dung becomes greenish, and so much the more, by how much it shall depart the farther from health.

Whence it is made manifest, that the Milk, as well in us as in bruits, is made of a Citron or deep yellow colour, by a digestion of its own; to wit, that all Cream, insliding by the voluntary thred of nature, and corruption, unto an excrement, and by its own motion, waxeth yellow, through the proper endeavour of the Stomach and intestines: And that it is most easily estranged, looks yellow, green, and obtains diverse favours or tastes, under the digestive faculty going astray: But not that therefore it is, or is made Gaul.

For these excrements are made in the Bowels, out of the shop of the Liver, and by strange faculties, nor in a Fold committed unto the making of blood: For truly, if the Gaul be a constitutive part of the blood, for that very cause, it is made also, in the place, and matter wherein, and whereof the blood is generated, but not in the intestine: For the first change of the milk should be into yellow, or green Gaul, and that naturally, and from thence into blood. That yellow Cream therefore, doth presently, of its own accord, profit in the *Duodenum*, and puts on those colours, not of feigned Humours, but of a natural excrement: Wherefore, neither is it a wonder, that the same thing happens in the Stomach, being hard-bound or distressed under any guilt of offence whatsoever; To wit, that the whole Cream contained therein, is presently translated into a vicious bitter, and yellow Chyle, the which in the Jaundise presently happens.

In the mean time, in the running of the Chyle downwards thorow the gut *Ileon*, it is sucked into the veins, whatsoever the Archeus hath judged to be not only most nearly allyed to nature, and meet for the preparing of blood; but moreover also, the whole Whey ascends towards the Liver, together with it.

9 But if therefore, the Chyle doth fore-timely assume the countenance of an excrement about the hedges of the Stomach, as being prevented by the error of the digestive faculty; either an offence of the Pylorus, or an error of the digestive faculty, or a vice of the food or Cream, or too much delay is signified: And therefore that it hath felt the vital ferment of the Gaul to be amiss or badly applyed: For so oft-times, it happens unto him that is in good health, that good Cream being offered, and rightly subdued in the Stomach, is (a Laxative cup being offered) estranged from the scope of nature, and through that tyranny, is wholly made a bitter, and yellow putrefaction in the bowels.

And the which, although it be cadaverous or stinking, and being newly produced from the blood; yet by reason of its bitterness, and the poyson of the solutive medicine, it is not tasted down by dogs, as neither by a swine; they otherwise, lesse abhorring the eating of dungs: For they percieve a bitter poyson of the purging medicine to subsist, being far different from the goodnesse of Meats, blood, and flesh. Be it therefore a faulty argument;

10 The poysonous medicine hath caused a bitter juice from the Meats, drink, and blood; therefore it is Gaul and Choler: And likewise, the Stomach being ill at ease, hath caused a bitter excrement; therefore it is Gaul and Choler procreated in the Liver, and poured out into the Stomach, through indirect trunks: It is plainly an undiscrēt fiction, that Choler is a part intended by nature, and that it should be framed by the Liver, which from the corrupting of a solutive medicine, and vice of the digestive faculty, in the disease called Choler, the bloody flux, &c. is commonly bred by proper causes: As if the off-spring, effects, fruits, and products of errors, were a constitutive part of our blood.

Therefore, that which the Schools name a native part of the blood, a compeer with putrifying Chyle, and Choler or Gaul; That is wholly a meer excrement, alienated and degenerate, from a natural agent being badly disposed: So also, the filths of the eares shall be Gaul, if yellownesse and bitterness be sufficient for it to be called Gaul: which being granted, now that yellow excrement which is rejected by vomit, as dung, shall be near akin to, and of the family of the blood.

11 But at leastwise, the Schools will have the yellow and bitter excrement which is rejected at the beginnings of a Tertian Ague, to denounce gaul infallibly: for they prove gaul from a Tertian; and this again, they prove to be gaul, from gaul being cast up. First of all, they consider not, whether such vomiting shall succeed from an aguish fit, or next, in one that is in good health, from an inordinate supper, &c. That notwithstanding, the property or nature of that excrement is not therefore changed, otherwise, so great an ejection of meer Choler, should import a trampling of the Tertian under foot, if this were caused from choler; wherefore it is neither choler, nor gaul, but the meer excrement of the stomach, and Jejunum or empty gut: Because that yellow excrement which is ejected at the beginning of a Tertian, comes not from the liver, or gaul, and so, from the shop of Choler; but it comes not far off from the orifice of the stomach, to wit, where its birth is; but not from the Liver; seeing it neither takes away the ague, nor even diminishes it. And likewise, it ought to be derived from the liver unto the stomach, through unknown thwarting passages: wherefore, neither could it come thither easily, nor readily (even as otherwise, it is quickly present in the like vomiting, and choler) nor safely, nor unmixed, and it should fall over far more safely from the gaul into the intestines; and from the liver backwards, through the veins of the Mesentery, than unto the sensible orifice of the stomach. Indeed, as well the feigned shop of choler, as the very seat of a Tertian itself, is placed too far from the stomach, that this may be the ordinary Emunctory or avoiding place, in these maladies: Why therefore is gaul brought rather unto the stomach, than to the bowels, which are far more prone and apt: For if that bitter excrement be bred elsewhere than in the stomach, it is altogether impertinently, and through a guilty passage derived unto the stomach.

12 And likewise, there is oft-times sixfold more of this yellow and bitter Balast rejected at one only vomiting, than the largeness of the little bag of the gaul can receive: The which therefore, could not be the Inn of that gaul, as neither could it obtain a capacity in the liver for its generation, nor be entertained between the liver and the stomach, without a mortal hurt, full of confusion. But if indeed it be gaul, and the product of the stomach itself; now the stomach hath stoln the faculty of making gaul, from the liver: and now, choler and gaul shall be made out of the liver, in a different Inn, by a different Guide, and equivalent workman, from that whereby the simple blood is prepared with it self;

self; or certainly there is no Choler of the essential composition of the blood. Is peradventure therefore, this choler and this gaul, which is rejected by vomit, made in an irregular place, and by an erring workman? Therefore also, of necessity, it shall be neither choler, nor gaul.

But there is nothing as yet manifested concerning another choler, that of the blood: It is therefore an injurious thing to the blood, and to the inbred choler of this, if there were any, to be founded and proved by an excrement which is never prepared by the principles, or in the shops of choler. Yea, from thence there is an equal right and liberty for whatsoever is supposed to be cholery, to be compared in essence, colour, savour, and in its efficient cause, unto this poisonous excrement voided by vomit in a Tertian Ague, and other nauseous effects; and likewise, for that which in the disease called choler, is expelled as well upwards, as downwards, and in solutive medicines, through a continual framing thereof.

And so now, from hence it clearly appeareth, that the Standard-defending inventors of choler, have by a rash and undiscerner boldness, introduced choler for an elementary apposition or making up of the blood (which they call its composition) and have falsely affirmed, that yellow and bitter vomited-up excrement to be gaul and choler, from the efficiency of the liver, and of the constitution of the blood. For how uncertain and stupid is the begetter, separator, sender, conductor, way and channel, by which that choler should be designed from the liver unto the stomach, by a retrograde motion? unless they had rather that the obediences and necessities of these should be foolish. But the Schools have never examined these things, but with a swift foot they have skipped over the bridge and clay, from whence they feared perplexities from absurdities, as if they gaped only after gain; the which, notwithstanding, they might have diligently searched into, to their greater profit, than to have daily over-added their own centuries unto the writings of *Galen*. For neither doth an excrement less differ from the blood, than the dead carcass of a swine from a man: For that carcass was at sometime alive, but that excrement never lived. But it hath been already proved, that no choler is formed in the liver. But if choler also, be made elsewhere than in the liver, from this supposition of the Schools also, it was not true choler; and much less from the essence of that (to wit, of an excrement) shall the essence of Choler be capable of proof: but if indeed Choler shall with any foot, originally enter into the family of an excrement, now, for that very cause, it shall be an Humour different from Choler; the which notwithstanding, the Schools do with a serious intention, will to be intended, caused, and desired by our nature, as if they were advertized by an Elementary necessity.

At leastwise, none of a sound mind is able to understand, why the veins of the stomach (which I have demonstrated elsewhere, never to be able to sup any chyle at all) shall allure unto themselves as a friend, that which the Liver, and which the veins, and the whole family-administration of the body have been once seriously averse unto, as worthy of banishment: which indeed so naughty a Fardle being begotten in some other place, being a Bastard and Forreigner, should be brought unto the stomach, which possesseth the Sense, Nobilities, passions, and tenderness of the heart. Surely in an inverted and confused order of things, should filths be thrust down unto a bowel expressing the harmonies of the heart, if they should be adopted, being as forreigners coming from elsewhere. Who is that mad and straying guide, which may thrust down such excrements to the stomach? For now the term of Choler ceaseth, while as the reliques of yesterdays supper are supposed to be badly digested, and to be cast back again as yet whole, with an unchewing tooth, yet yellow, and bitter: For neither are they correlative things, that much Choler should flow forth into the stomach, as oft as any notable vice hereof is present: For after a liberal and troublesome supper, even as also, after the fit of a Fever, loss of appetite, sufferance of hunger, bitter, burntish belchings, loathings, weight, giddiness of the head, &c. are alike present: wherefore it is easily to be believed, that those symptoms have also sprung from a like mother: So that (which I promised in the title) it is nothing but a dissembled vomiting of Choler, whereby the first inventors of Humours have credulously perswaded Choler.

They also say, that therefore Choler is also drawn out of the little bladder of the Gaul, ¹³ unto an hungry stomach: But by how sluggish a judgment that is confirmed, and that filths are by a retrograde driving motion fetcht back unto the stomach, let Phylosophers speak: For hunger desires not iron, or ice; but is only carried forth unto objects that are to be eaten, from whence nature hopes for nourishment to her self: But it is not carried promiscuously towards any objects: So neither doth nature desire, that which she had
once

once cast out as reprobate; As knowing, that any thing cannot be made out of every thing: neither therefore doth she hope for or look for nourishment from an excrement; The which, she therefore neither desires nor allures to her self: And I wish the Schools had considered that thing, before their rash doctrine of Choler. I grant indeed, that through inordinacies, inordinate and confused obediences do now and then follow: But I shall not therefore admit, that a sixfold quantity is drawn out of the little bag of the Gaul, for vomit, as neither that any thing is rashly drawn to the stomach; Seeing the very Gaul it self is a Noble and vital Bowel, even as elsewhere.

- 14 Wherefore, I now and then, in the more curiously searching, have lookt into the chest of the Gaul; and yet I have found no passage to lay open a-top; out of the Liver unto the Gaul; and that I suppose in right, for the deed done: Wherefore I have also judged, the Gaul not to be made by the Liver; but to be prepared materially of the pure blood of the Liver, and efficiently by the proper Archeus of the Gaul, in its own case or Chest.

At leastwise, if there were any unpercievable pore, (which there is not) that might inspire Choler from the Liver unto the chest of the Gaul; why therefore doth the mouth at the utterance of the Gaul, lay open fifty times more at least, for the ejecting, than for the entring of Gaul? For truly, no entrance could as yet be discerningly viewed by the eye, for so many ages. Is there not also, from hence an easy confirmation, that the orifice of the Gaul tends into the empty gut, only for an in-breathing of its own vital and necessary ferment?

- 15 For the Gaul in a Tertian, should never be sufficient for tinging of the urine, the droffes of the paunch, also for tinging of the daily nourishment, and the which they require for the substance of the blood: Moreover, as neither for the abundance, which even sober persons vomit up, every other day, about the beginnings of their fits: For had it not behoved them from hence to have learned, that whatsoever they call Choler is a meer excrement, procreated from a diseased constitution? and that, what is so engendred, cannot repaire the essence of the blood, Choler or Gaul? Because it is that which hath no right of judging of the necessities of a quaternary, for the integrity of the blood, and an apposition instead of a composition: For as soon as sour belchings are made in the stomach, the presence of that unhappy and bitter excrement made in the stomach of the Chyle being defiled, ceaseth: And therefore from that time, burntish stinking belches depart. It is therefore feigned Choler in the stomach, whereby the Schools contend originally to stablish the Choler of the Liver alike feigned: it ariseth from the inordinacy of the stomach, but not from the intention of nature for the constitution of the blood.

- 16 It is therefore wholly an excrement, and badly squares with another Choler feigned to be in the composition of the blood: Because it is that which will never be proved to be within the bounds of nature, since no necessity of its presence presseth the same: For the Gaul is a vital bowel, and exceeding necessary; Wherefore neither is it rashly to be reckoned synonymal or of the same name with an Humour, or an excrement, as neither to be accounted for a part of the blood.

For they say, that the Elements do repeatedly destroy and devour each other; But they have hitherto failed in the proof: But they alleadge onely artificial fire, which they think, doth convert water, and air into each other, as oft as those are no longer beheld: But they fail in their own position; For they teach that fire converteth water into it self, and not into air: And it should be a foolish action of the fire, which should labour not for it self, but for the air: Yea although water quencheth fire, yet it was never seen, that on the other hand fire was made water: For they have thought it sufficient to have stated, and not to have proved their own positions. But among Humours, that which they will have to be made like unto fire, they shew a water, not sharp, biting, as neither salt-bitter, but modestly salt; and the which, they elsewhere call the Whey of the blood, its Etymologie being drawn from the watery part of Milk: They call I say, Choler an Humour answering to fire: For they command that, that the Elements ought to obey their dreams: For the Schools being seriously asked, say that Choler is an Humour meerly fiery and Gauly, because it is actually composed of fire predominating: But I being silent, as to these trifles, am amazed, while as I behold a waterish whey swimming on the blood.

- 17 They add also, that true fire is suppressed in Choler, as being masked, and bridled by the form of the mixt body: But let them believe that will, that the form of Choler being received from the meer dominion of fire, that it might produce the effects of that Element

Element in us, should so restrain its own product, wherein it should actually lay hid, that it should be altogether Cold in act, and be a wheyle and meerly a watery Being.

I therefore suppose and know, that if but a very smal quantity of actual fire were in a mixt body, that it would presently perish, as being suppressed by adjuncts: Yea, if fire should nevertheless, persist safe by an irregular power; at leastwise, it should not any thing worship the form or body of that mixture, but should according to its own disposition, wholly burn and consume it, without reflection, or connivance: Therefore either the fire should cease, or the mixt body of necessity perish: neither could the form of Choler hinder either of the two: For it hath not hitherto been seen, that an artificer who prepares glass, earthen pots, tiles or bricks, Aurichalcum or Latren, &c. by the fire, can in any place, or at any time couple fire unto earth, water, and air, that he may from thence constitute any mixt body, and much lesse that he can allure fire to flow down from Heaven, and shall connex it with air, water, and earth. Its a wonder therefore that the whole faculty of medicine doth hitherto establish its Basis in an impossibility: And so much the more wonderful, that the whole world hath as it were snorted in a deep sleep, at these deaf dreams, and hath befooled all with a credulity; And so much the more to be admired, that they have believed the fire to be suppressed under other Elements in mixtures, and nevertheless, as yet to remain safe; when as notwithstanding, they have sufficiently known and taken notice, that all fire presently as soon as it ceaseth from burning, or is joynd to water, perisherh and is reduced into nothing: For if the Schools had brought the vital spirit, or sky-ie air instead of fire, they might have seemed worthy of pardon: But they had rather become foolish in the dream of *Epimenides*, than not to have found an Humour like unto fire, that according to lying conceptions, a quaternary of Humours might arise.

For, for air, they have feigned a privileged Humour, which should not be excrementitious, after the manner of its two companions: And therefore they now and then call these, nourishing ones, yet for the most part superfluous ones, if not also liquid dungs: But profitable ones, especially in that respect; not indeed as if they do nourish the spermatick parts, besides the Cases of the Gaul-chest, and Spleen; (but at least, they are most miserable members, which are constrained to be fed only with excrements, and to yield to the privilege of the kidneys :) But they note a ridiculous profit of yellow Choler, that it spurs up the fundament, and urine; when as, in the mean time, pale urines are more incontinent than tinged ones: Yea the belly of those that have the jaundise (which they say, is deprived of Choler by reason of ahy excrements) is ordinarily, loose enough: But seeing the three Humours which are feigned to be in the blood, differ not from themselves being rejected, but only in the infamy of superfluity; the radical moisture it self could not but be nourished by excrements, if both the Cholers, and phlegm were for nourishing. But that a plenty of Choler (which they say is daily) may after some sort be supposed; There is at least, every other day, in a Tertian ague, a large quantity cast up by vomit, also besides its daily consuming, which they say, is necessary for nourishing: Yea the plenty of this feigned Choler more cleerly appears in the jaundise, which they define, only from a stoppage of the Chest of the Gaul: So that then the urine is nothing but meer Gaul, and the whole habit of the body, and also the internal parts, the most inward and the most outward, to be Gauly: The which, since they are accounted nothing besides Gaul, it being no longer ejected through the paunch; Hence it is discerned, that threefold more of Choler at least, is daily generated, than of blood being connexed of the three other Humours together: They being badly mindful, that sixfold more of tincture departs through a jaundise urine alone, than otherwise, in an healthy person, the belly and urine do utter together: whence at least, it followes, that the jaundise is not the obstruction of the Gaul alone as they think: For the orifice of the Gaul being shut, presently, the Gaul (say they) exceeds the whole blood in quantity: For neither is a leaky and cankerous tincture (such as frequently proceedeth out of the stomach) very frequent in the jaundise. Moreover they say that phlegm is carried with the blood, thorow the veins, and at length changed into blood: So that they constitute the proper shop of the blood, and its promiscuous efficient, as well in the veins as in the Liver: But at leastwise, a quaternary of Humours sayeth, if yellow Choler differs not from black, but only in the thickning of re-coction, and if phlegm differs not from blood, but only in a lukewarmth and cherishing: For roasted flesh is not wont to be distinguished from raw in kind; wherefore neither should phlegm disagree from blood, but only in its maturity; as unripe Apples do from ripe ones: But they could never shew phlegm in the veins, except fibers, which sepearate themselves in warm water, by cutting of a vein; and so,

Sssss

neither

neither do they begin to be, or to be seen, before the death of the blood: For as long as the blood is profitable for nourishing of the parts, the more solid part thereof was undistinct from the rest of its body; Because it was a true and entire composure: For that thing is one every side obvious in the frame of nature: For since nature acteth for ends known unto her Authour, one part always more readily receiveth the impressions of the Archeus, than another: For the end of the venal blood was a nourishing of the solid members; And therefore it by little and little, breaths after, and attaines the degrees of solidity: The blood therefore, as soon as it is perfected in the Liver, it assumeth in its more mature, and more spermatick part, white fibers or threds, and the beginnings of a desired homogeneal curd, which at first, it had not in the veins of the menterery, as is manifest in those have the bloody flux.

23 Indeed it is therefore, the best and most perfect part of the blood which the Schools call phlegm, and the which I know to be akin to a more solid and spermatick constitution: The Schools (I say) name phlegm the daughter of crudity, old age, and defects, even in a child, a youth, and a man: For I dissent also in this, from the Schools: because for the proving of phlegm, they offer nothing but snivel, meer filths, and liquid dungs to be beheld; such as is oftentimes cast forth by vomit, the kitchen of the belly being defective: For oft-times, that which is shaved off by a cruel draught, as also the snivel of the nostrils, and that which is spit out by reaching from any vice of the lungs whatsoever, are the meer phlegm of the Schools: which filths indeed, are prepared by diseasifying causes, through the errors of the last digestion. And so great is the dulness of the Schools, that with their own Galen, they condemn the food of sinewes, membranes, tendons, &c. Because they think them to be the mothers of phlegm: Neither do they heed, that the similar parts, and those of the first constitution, are of a spermatick or seedy nature, and those altogether by an undistinct confusion, they call phlegmatick ones: As being ignorant, or at leastwise unmindfull, that we are most nearly or immediately nourished by the same things whereof we consist: And so, if the humours are as phlegmy; Surely one of these two must needs be true: Either that the Schools know not now to distinguish phlegm from a secondary and spermatick Humour: or plainly that there is no phlegm at all in the blood: And that that which they have supposed to be phlegm in the blood, is the beginning and foundation of the secondary and immediate nourishment of the solid members. Now I must speak of yellow Choler which is supposed to be in urines, with the admiration and grosse ignorance of fore-past ages.

CHAP.

CHAP. IV.

The signification of the urine according to the
Antients.

1. The division of urines. 2. No unfit observation of Paracelsus. 3. The Authors aime. 4. It hath been erred hitherto in judgment, concerning the circle of the urine. 5. From whence the circle in the urine is. 6. A childish opinion of Galen. 7. It is proved that Gaul is not in the urine. 8. The unconsiderateness of the Schools. 9. What the yellownesse of the urine may betoken. 10. That nothing of Choler or Gaul is in the urine. 11. A threefold error in this thing. 12. A begging of the principle. 13. That Choler is not snatched out of the urine unto the brain. 14. Some accompanying absurdities. 15. From Anatomy. 16. From the Faundise. 17. What watery urines suddenly after tinged ones in Fevers, may fundamentally denote. 18. That the prognostications of the urine have been meer dreames hitherto. 19. A channel is wanting. 20. Under the division of motions. 21. The little cloud of the urine, whether it denoteth phlegm. 22. All things are cocted in us for one only end; to wit, that they may nourish. 23. Why the spleen hath a double ferment. 24. What that may be, which the spleen doth sometimes belch forth into the stomach. 25. That any effect is not taken away, the cause being removed. 26. What a confused or troubled urine may bespeak. 27. Whence crudity in the urine is. 28. Why the strangury is scarce cured in old folks. 29. Whence the lumpy sediment or ground is. 30. Errors about contents, as well those proper as forreign, elsewhere concerning Duelech. 31. As yet a new method of judging of the urine by the weight thereof.

And moreover, the Schools for the divination of urine, presuppose a watery or watery matter; on the opposite part to this, a thick one, and then a moderate one: And likewise, confused, turbulent, dark, even as also cleer and perspicuous urines: But some, of confused ones, do by heating, return into their former transparency; others remain troubled.

Lastly, some urines being made cleer, are presently again disturbed; but others with difficulty.

Secondly, they consider almost all colour, from the watery, white, milky, and dull; and also from the cleer watery, even unto the blackish colour.

Thirdly, its proper, and forreign contents are viewed: Forreign ones indeed, I call, slimy, bloody shavings, sands, and stones: And those either soon affixed to the utinals, or freely settling: But proper contents are those, which are almost ordinarily thrust down out of confused urines, or which swim in cleer ones, in their superficies, a little under it, in the middle about the bottom, or laying on the bottom it self; and those either cleaving together, or rent asunder.

Fourthly, they consider the froath, and bubbles.

Fifthly, they at length consider of the circle. But Paracelsus moreover, distinguisheth the body of the urine, into the urine of the drink, and mixt of both: He calls it that of the blood, if he that makes water in the morning hath not as yet drunk, the day before, in the evening, and in the night: But the urine of the drink is that which is collected from much, and little waterish drink: Also he calls that, a mixt urine, which is that of sober or temperate persons. Furthermore, what he feigneth concerning an Alcolled, and tartarous urine, shall be manifested in the treatise of Tartars. First of all, I protest, that I do not any where strive to reckon up those things that have been well

written by Ancestours, and much lesse to chastize them, nor to handle the precepts of the judgments of urine, nor to explain the inventions of others, as neither to make an Apology for them: But I only desire to discover the Antient errours of the Schools that have arisen from feigned humours, that juniours may not hereafter be led aside according to rash beliefs of dreams.

3 First therefore I will reckon up the errours concerning the circle of the urine; and then those committed in its colour: thirdly, those which happen in the little cloud or swim thereof; and fourthly, I will make manifest those which have happened in the judgments of its coagulations, or contents: From whence, any one may easily understand, that the judgments and prognostications of the urine have hitherto stood without judgment, and a foundation: To wit, that the wonderfull impostures of *Gordon* have been set to sale unto ignorant poor people, under the false title of a Diviner.

4 First of all therefore, they have stumbled in the circle of the urine, since it hath hitherto been unknown, why the circle is oftentimes, of another colour than the rest of the body of the urine: Indeed it hath been supposed, that the circle is separated from the rest of the body of the urine, as the fat from the watery part, or as it were the cream from the Milk whereon it swims: In the mean time, although the urine be stirred, yet the same circle which was before, forthwith appeareth, and not any thing hath been further searched diligently into, concerning the circle out of its supposed bounds: They see indeed the circle to be oft-times more red, and more full than the colour in the remayning body of the urine: yea, that a more ruddy, and more deep yellowness doth for the most part want a circle distinct from the colour of the urine:

5 Yet have they not diligently enquired, from whence there should be that variety of the circle and urine: Notwithstanding, neither therefore is the circle a certain colour falsely appearing, and deluding the eyes with a false shew of it self:

For neither otherwise, could a somewhat yellow urine, yield a more red, and heightened colour by a naked reflexion of it self; but should rather paint out a more pale colour, than a yellowish one, if the colour of the circle were only appearing from a reflexion: Therefore the reason of the altered colour in the circle of the urine, dependeth in very deed, on the very body of the urine it self; And so, the circle alone, shewes the whole consistence, colour, and transparency of the urine, because it containeth them: which thing the wood Nephritical or for the stone of the kidneys, teacheth by a notable example: For this wood being steeped in rain water, if thou shalt afterwards behold its infusion sideways, it is wholly red in its body; but that decocted, or infused steepage hath an Azure or Sky-coloured circle, however disturbingly thou shalt shake it at thy pleasure: For so the colour of the blood being beheld thorow a vein, appears of an Azure colour: So also, the sky-colour in the circle of the decoction of the Nephritical wood, is indeed Azury; but being multiplied, it lookes more black, and of an obscure colour, tends more to white, than a red one, being diametrically seen thorow a glasse, or vein: After the same manner, in the body of the urine a red colour appears simply such, as it doth in the circle, which being re-bounded or weakened from a crosse the urine, is not of so citron a colour in the circle. The circle therefore, is a true token of colour in transparent urines; but in dark or thick and troubled ones, a circle doth not appear. But as to what pertains unto the colour of urine, the Schools say, that a watery, thin, pale urine, is a sign of digestion being deficient, even as that which is tinged with a manifest yellownesse is a token of good digestion.

6 It is a saying of *Galen*; *I make water after midnight, the which while I see it not yet to be tinged with a due yellowness, I return to sleep: And awaking two or three hours after, I again make water, and I find my urine filled with a due colour:* Whence I conjecture that a perfect digestion, and yellow Choler of the Gaul, is now poured on my urine: This is also the moderne doctrine of the Schools: Yet I, as yet doubt, whether the yellownesse of the urine may be always attributed to one cause; Since they unconstantly attribute it, sometimes unto digestion being finished, but sometimes, unto yellow Choler being mixt therewith: But least they should erre, they have joyned both. I therefore, since I found none who hath distinguished himself herein, am constrained to explain both: For the urine of him that is feverish, is yellower than that of him who is in good health; yet the digestion of this is far more lively, which thing is without controversy: Therefore let the yellownesse of urine only without a laudable swim, be a deceitfull sign of a good digestion.

And then, if but one only drop of Gaul, shall be in two points of urine, the whole becomes bitter: but the urine although of a Citron, and Saffron Colour, is never bitter

bitter: Therefore it receives not Gaul admixed with it, nor is the tincture thereof, of Gaul.

Truly, if the Schools do judge of things by favors or tastes, why are they so little careful, as that they have never made trial of that thing concerning urines? For doth yellownesse only suffice, that Gaul may be judged to be in urine? Or is it a more befitting thing for a Physitian to teach falsehoods, and to affirme lyes to the destruction of the sick, than to have once tasted down his own urine? seeing that not so much as the most full yellow urine of the jaundise, bears any thing of bitterness before it. Pride therefore hath justly discovered the error of the Schools: At least wise, it is not to be doubted from the words of these Schools, but that a tincture is added to the urine about the end of digestion.

The which, if it be so, why at leastwise, have they not from thence acknowledged the yellownesse of the urine to happen not from Choler or Gaul, but from elsewhere? Because if Choler were made in sanguification, together with the blood and urine, and being co-bred together with, and sprinkled on the urine from the beginning, should tinge the urine, Choler should neither be the last thing constituted in the Liver, if it were a constitutive part of the blood, and its superfluity should be straightway wiped forth with the urine, neither should it make a seperated Inn for it self, for a time: Or if that be supposed, at least that Inn ought to be named, and by Anatomy to offer it self and to be found.

But seeing yellownesse in the urine of *Galen*, is more late than the body of the urine, a place of the utmost part of the gut *Ileon* is denoted, where, when as now the cream begins to wax duncy, something of the liquid dung is drawn from thence through the veins of the mesentery, in the end of the *Ileon*, which is besprinkled on the urine, as profitable for its own ends (even as before concerning Fevers, and elsewhere concerning the disease of the Stone.) But that the yellownesse of the urine is of that liquide dung, and in no wise of the Gaul, not only the taste of the urine, but also its distillation do manifestly approve: For truly, the stink thereof riseth up in distilling: But for what end, the liquid dung may be convenient in urine, is taught in the places cited.

Now it is sufficient, that the Gaul of a bird, or fish, being even but slenderly burst, however most exactly they may be washed, yet a bitterness remains: Therefore if there were but the least of Gaul in the urine, or liquor Latex which swimmeth on the blood let out of the veins, it should be of an unexcusable bitterness: But the consequence is false, therefore also the antecedent.

The Schools therefore, have trebly erred in this matter.

First, while as they being ignorant, that yellow and liquid dung is mixed with the urine, suppose it to be Choler.

Secondly, Because from yellownesse alone, and a custome of subscribing, they have conjectured of Choler: As if nothing were of a saffron Colour in us, which ought not also to be Gauly.

They indeed prove the same thing by it self: To wit, that Choler is in nature, because it is manifest in the urine: And again, that what is yellow in the urine, that ought to be Choler: Because, with us, nought else but yellow Choler should be of a yellow colour.

Thirdly at length: For the judgment erring concerning the ordinary colour, and so concerning the very content of the urine, it must needs be, that prognostications of the urine do fall to the ground, as many as have hitherto been supported by Colours, and contents: But at least wise, since it is now manifest, that the yellownesse of urine is not Choler, but a duncy excrement; it is no wonder, that another yellow excrement is bred in the stomach, which also is bitter, by a far different, and proper error of its own ferment, which therefore ought not to be of the family of the Gaul.

Furthermore, seeing that in Fevers, yellow urines do suddenly wax pale, and a future doatage is signified, and since that thing is interpreted by the Schools, to come to passe, as Choler is snatched into the brain; It is a faulty argument, of not the cause, as for the cause.

For it is sufficient, that it hath been already demonstrated, that that doating delusion is not bred from Choler snatch't up into the brain; but because the liquid dung which was wont to go with the urine, is now detained in the Hypochondrial or place about the short ribs; neither is it mixed with the urine, as it was wont to be: That doatage therefore, draws its original from that seat from whence all madnesses derive theirs, as I teach in its own treatise: For by this title also alone, some madnesses are therefore named Hypochondriacal ones.

14 For otherwise, who should that snatcher of Choler be, which should bring this unmixt, into the brain, and being seperated from the blood of the veins through which it should be brought, or from the urine? For to what end should it snatch that Choler, since nothing is done without an object, at leastwise appearingly good? How should he bring it thorow the blood unto the brain, without contagion? After what manner should it be rightly seperated from the blood: for truly, the supposed Choler swims not on the blood let out of the veins, unlesse the blood be first dead and coagulated in the veins, not so much as in those of a dead carcase? Again, into which bosome of the brain, at length should that uriny Choler be powred forth, wherein it should work a speedy death? Who in the next place, shall that seperater be, who should now wrest aside that Choler that was wont to incline to the urine, out of the little bag of the Gaul, unto the head? And which way should that be done? Shall the disease matter it self, voluntarily ascend to the brain, and shall it be the mover of its own self? Then at least wise, besides great absurdities, it should of necessity be, that every such Fever should not consist out of the little bag of the Gaul, which none hath as yet hitherto supposed.

But to what end should a Fever (which they account a meer accident) stir up Choler to the head? Shall it be judged best in nature, to have now at length banished the matter of the disease which a good while lurked in the midriffs, into the head? Or what if it wandringly floateth in the veins, as being seperated from the blood, and of its own accord shall climbe upwards, why is it not rather banished out of doores thorow an accustomed passage? Shall mans nature, now procure its own death, contrary to the universal endeavour of things? Shall such a fury at length, be fit for the sequestering of Choler, which was not seperable but by an appeased vigour? Doth happily, the Gaul being desirous of a wandring stare, of its own accord and voluntarily seperate it self, and ascend to the head? At length, in what bottle doth Gaul lurk in the head, that it may stir up a Feverish madnesse? Is it in the bosoms of the brain? Is it in the feigned arterial weaving of *Galen*? But on both sides it should presently be mortal; and Gaul would drop down thorow the doating nostrils.

15 Again, if watery urins in Fevers, after yellow ones, do afford safe doatages, with laughter; Yet surely, according to *Hippocrates*, then these kind of doating delusions shall not be from Gaul: And so neither shall the urine being now spoiled of its yellow Colour, have that for which it may be deprived of Choler, nor whereby it may lay aside snatched Choler into the brain: For truly, doatages with laughter exclude all Choler.

16 At length in the Jaundise, the brain it self is yellow: But if the Jaundise be from Choler, why is it without doatage? Without an Erisipelas, or great inflammation of all the bowels? But if not Gaul it self, but the vapour thereof (an unconsiderate evasison) ascending into the brain, stirs up these doatages of Fevers: why therefore, will the Schools have the Gaul, materially, and according to its tincture, to fail in the urine?

17 A waterish urine therefore, after yellow ones, in Fevers, denoteth, that the tincture of the urine or liquid dung (it is the liquour of meats in the bowels, immediately before they become dung) is without mixture detained in the midriffs: For a vein strongly beating in the places about the short ribs, denotes madnesse to come, according to *Hippocrates*: As the Liquid dung being not rightly purged, tumulteth in the Hypochondrials.

18 Therefore they are meer dreams, which the Schools do hitherto, as it were from a three-legged stool, foretel concerning the colour of the urine. They have indeed learned by the effect and observance, what things are wont mutually to follow each other: To wit, that doatage in a Fever, is from a cleer urine after a yellow one: Rightly indeed, if they had stuck in a naked observation: but when they came unto the causes, and disposed of those causes according to the rite or custome of Theoremes, and command of feigned principles, they all of them rashly subscribed unto each other hitherto: For there is no Choler in nature, never any Gaul in the urine; and much lesse, that which may be seperated from thence, and carried unto the head: There is no Choler in the whole body, because there never was any in nature: Neither is Gaul Choler, but the very liquour of the Gaul is a vital bowel, of great moment, between which, and the kidney, and brain, nothing interposeth as common: Neither is there any passage, nor fit society of the Gaul with the urine: Neither doth it appertaine unto the Gaul, whether the urine be watery, or yellow, and thick: The chest of the Gaul hath not a vein unto the head.

But

But if they will have Gaul to be brought thorow the hollow vein, how should not Gaul 19
mix it self with the blood? Should not the whole blood of those feverish persons be bitter? By what channel therefore, shall it hasten unto the head? What conductor shall lead Gaul unto the head: What shall sepearate it from the blood, that it may not be detained in its journey? To what end should nature attempt such impertinencies? How shall the blood remain without contagion from the forreign Gaul? That ascent shall be a voluntary motion, or a sending, or a drawing.

A dreaming old woman said so long ago, and the Schools have followed her: For if 20
Gauly Choler climb by its own motion, now every man shall have a continual doatage. But to what end shall the hollow vein send Gaul unto the brain? Shall it thus cure the Fever? Shall it diminish the burning heat? But surely the feverish matter remains shut up, whether Choler be snatcht from the urine, or Gaul out of the little bag, into the brain, or not. To what end also, should the brain allure Choler unto it self, being moist with a lively juice, and that a far better, and nearer? And that thing also fights with the ordination of the Liver: For nothing is sent, or drawn, at least without the choice, end and appointment of the Archeus: Is therefore Choler carried into the brain, from the wedlock of the other three Humours, or is it drawn by this? Surely the brain was thus already before, befooled, and not after the coming of Choler, neither had it need of Choler, for to doate. At length, why doth a watery urine rather argue a doating delusion, in a continual Fever, than in an intermitting one; than in a drinker? Than in the disease of the Stone? Than in a vitiated concoction of the Stomach? But because death is in the midriff, where the Fever then also is.

Vain therefore is the fiction of the Schools, concerning yello v Choler in the urine, and 21
of its journey unto the brain. But besides, when as a little cloud appeareth in urines, straightway the Physitian cries out, and as if himself had overcome the disease, saing with the consent and observance of the Schools, that the diseasifying Humour is concocted, and that it is safely to be purged for the future. I will shew first, what that little cloud may be; And from thence any one shall at length judge, that in the aforesaid particulars, nothing but meer mockeries are contained: For indeed that little cloud or swim is a sign of the digestion of the stomach; but not of a diseasifying matter.

But be it a sign of digestion, because the ferments of the stomach, Gaul, and Liver have 22
returned, which before were hindred; shut up; &c. Whence there is hope, that the strength will be recovered: otherwise, the matter, which they call that which maketh the disease, is never attempted to be concocted: Because nature intends not to coct, neither doth coct any thing, but for a single end, and after a single manner, to wit, that she may reduce it into her own nourishment, and for no other end: but the ferments (to whom only it belongs to transchange things) being now restored, will subdue the matter of the disease under the Ferule, in the Inns of digestion, and root it out at pleasure: For I have taught concerning digestions, that sharpnesse in the stomach, is not from the brackishnesse of things being recieved into the body, but from the sharp or sour specifical ferment of the stomach it self: But even as it is the property of sharpnesse to coagulate milky substances; therefore, whatsoever of the Cream of the stomach is in it self milky, cannot be so exactly sepearated in the Liver, as that a smal quantity thereof is not snatcht with the urine, and there doth not make a little cloud. The little cloud therefore is a signe of the ferment its returning into the stomach: For neither is that swim in the urine, from the nature or matter of the Fever, neither doth it accuse, or excuse the same: Neither at length, is that little cloud a sign of the proper Ferment of the Gaul (for this is not sharp, but salt, and of the tast of the vital spirit; even as elsewhere, concerning long life) but of the Ferment of the spleen; to wit, that which the spleen breaths into the stomach, the patronage whereof it undertaketh: For therefore in a Quartan ague, that smal cloud, oft-times appeareth, and again, oft-times dispeareth: while as, the appetite and digestion are restored, and again departeth, the same Quartan in the mean time, always remayning: otherwise, if that little cloud should signify the mater of the disease, as its object, or efficient, certainly, it should constantly persevere, being once bred; Since the matter being once cocted, doth not regularly wax crude again. Therefore, for its own family-administration, and the proper digestion of that bowel, the spleen hath obtained a vital ferment, from a spirit implanted in, and proper to it self: For therefore, it is of the property, odour, and tast of the vital spirit; The which, seeing it is saltish, and balsamical (even as concerning long life) it ought also, to subdue and overcome the matter of a Quartan: But a care of the stomach is committed to this bowel, and for this cause it sits president over the digestion thereof; and therefore it hath obtained another acide Ferment

- ment to this end, the which, unlesse it be inspired into the stomach, in a due dose, lack of appetites, crudities, yea and an inordinate hunger or appetite it self, do arise.
- 24 Therefore if this comely ferment of the defence of the stomach be exorbitant in the spleen, there are made, bloody and black spittings out into the stomach, which the Schools have judged to be black Choler: when as otherwise it is nothing but an expurging, and renewing of nourishable blood from the spleen it self: Therefore the sharp ferment of the stomach, although it be the cause of the little cloud, and the whole soure cream, be ordinarily turned into salt, under the dominion of the Gaul (as concerning digestions elsewhere) yet the little cloud remaineth, being bred from sharpnesse.
- 25 By reason whereof, we must note, that the cause being removed, the effect is taken away for time to come, but not for the time past: Because the effect for the time past, is a product now subsisting by it self; oftentimes also, having no longer need of the accompanying of former causes: It being that which hath never been hitherto considered, as neither distinguished of in the Schools. Therefore a confused urine is oftentimes pissed forth by those that have the stone and likewise in the beating of the heart, and otherwise: But another urine, although it be clear, yet it is of its own accord, voluntarily disturbed in the air: And indeed, every troubled urine containeth an hidden sharpnesse, and the lesse thereof, if it hath been once cleared at the fire, and is not troubled afterwards: At leastwise, it betokeneth a defect of the ferment of the Gaul: Because there is denoted, that a very smal quantity of lukewarmth shall coast and overcome the sharpnesse that is left: For so, apples not yet ripe, wax sweet with the Sun. As oft also, as the ferment of the little bag or bowel of the Gaul, tramples one the ferment of the stomach, and viciateth the Pylorus, so often there is a crudity of digestion, and so also the urine is without a swim. In the stomach also, there is now and then a bitterness, from its digestion erring, which brings forth such a superfluity.
- 28 But if the ferment of that bowel be supplanted, there is a grosse and white sediment of the urine, nor ever without the strangury or pissing by drops, the which therefore in old people, is difficult to be cured: But that sharpnesse of the urine in stranguries, although it be not manifest to the tast; yet in how smal a quantity soever it be, it is sufficient for the aforelaid effects of pain; which is manifest in the urine of new Ale, as yet unpercievably participating of the brackishnesse of its Ale: But while the ferment of the Liver doth too much exceed the activities of the stomach and Gaul, there is a Bolar or lump-like sediment, in a troubled and red-yellow urine: As if that did wish to be made blood, which is unfit for that appoyntment.
- 29 But a red sediment in a yellow urine, and that which easily melteth through the heat of the fire, denots the ferment of the Liver to be exasperated by a forreign impediment: Which historie of ferments is inserted in the treatise of digestions. There are also last of all, manifold errors & sluggishnesses about the original contents; which in the treatise concerning the disease of the stone, I have professedly weighed. There is in the mean time, a safe method of examining urines by their weight; To wit, an ounce weigheth 600. grains. But I had a glassen vessel, of a narrow neck, weighing 1354. grains: But it was filled with rain water, weighing besides, 4670. grains: the urine of an old man, was found to weigh in the same vessel, 4720. grains; or to exceed the weight of the rain water, 50. grains: But the urine of an healthy woman of 55. years old, weighed 4745. grains: The urine of an healthy young man of 19. years old, weighed 4766. grains; But that of another young man of a like age, being abstinentious from drink, weighed 4800. grains: The urine a young man of 36. years old, undergoing a tertian ague with a cough, weighed 4763. grains: But the aforelaid youth of 19. years old, with a double Tertian, had drunk little in the night aforegoing: but his urine weighed 4848. grains; which was 82. grains more than while he was healthy. A maid having suffered the beating or passion of the heart, made a water like unto rain water, and the which therefore, was of equal weight with rain water: A lukewarm urine is alwayes a few graines lighter, as also more extended than it self being cold: And therefore, let the vessel be of a short neck and sharp pointed, that it may measure the urine almost in a poynt. Another shall add and meditate of more things: And it is a far more easy method, than that which is reduced into Aphorisms by weighing of the whole man: I have always breathed about the essences, remedies, and applications, or for the curing of a disease: and who am one that have hated the common applause: I have hated also the prognostication, prediction and fore knowledge which was familiar to divinations: I have rather rejoyced to heal the sick party, than by speaking doubtfully, to have foretold many things.

CHAP. V.

That the Jaundise is not from yellow
Choler.

1. The supposition of the Schools in this case.
2. A fit answer.
3. An ordinary, and ridiculous privy shift.
4. Another evasion.
5. The cause of the Jaundise is taught by Anatomy.
6. The Schools intangle themselves.
7. From an impertinency.
8. A double vice in the jaundise.
9. The forgetfulness of the Schools.
10. Absurdities upon the causes of the Jaundise of the Humourists.
11. Four absurdities.
12. That the bitterness of the mouth doth not argue Choler.
13. That the Jaundise is not from the Gaul being stopped.
14. There is always some poison in the Jaundise.
15. That colours, if they are inordinate in an excrement, are not made from causes ordained in nature.
16. It is proved by proper remedies.
17. That curative beokenings are not drawn from things helpful and hurtful.
18. The adequate or suitable cause of the Jaundise.
19. That the Jaundise is not bred but from single causes.
20. That the Jaundise is not cured by yellow remedies, as such.
21. A History in the strangury of an old man.
22. The Oxe scoffs at the causes of the Jaundise delivered by the Humourists, and at the use of grasse-roots.
23. That Choler is not dismissed for tinging of the excrements of the belly.
24. The pale dung of the bowels doth not so much accuse of the absence of the Gaul, as of the error of its transchanging.
25. Against the possibility of the Gaul being obstructed in the Jaundise, by reason of the essential thingliness of the disease being unknown.
26. Another argument.
27. A third.
28. From an impertinency.
29. From the impossibility of tincture.
30. From bitterness.
31. From the disproportion of the thing tinging, and of the thing tinged.
32. The generating of an unnamed poison in the Jaundise.
33. Some absurdities are proposed, to be seriously considered by the Humourists.
34. A conclusion from the premises.
35. The nest of the Jaundise.
36. An error of Physitians about the passing of Choler into a fish.

The standard-defending argument, whereby the Humourists believe that from a full necessity, they have confirmed the existence, and generation of yellow Choler, and that which supplyeth the room of an Anchour, is the Jaundise: In favour whereof, they contend, that the Chest of the Gaul is stopped up in its passage towards the empty gut: Therefore that the Choler daily generated, is presently also after its birth, regorged and dispersed into the whole body; wherefore as they suppose, an ordinary and necessary generation of Choler or gaul, so also a daily banishment, and separation thereof. But they prove the Lower passage of the Gaul to be stopped; because the excrements of the belly are destitute of Gaul, therefore also of an ashy colour and not yellow: Wherefore the urine offers it self twenty times more tinged than is meet; and daily, more meersly or purely so: Therefore as well the excrements of the bladder, as paunch, draw their tincture from the Gaul.

First, They have not yet proved any upper entrance of the Gaul unto the little bag, as neither hath it hitherto, by exact Anatomy, been found: Therefore the excrementous Gaul should either daily enter through the lower passage, or unsensibly: not in this manner, where there should be so great abundance of gaul daily; nor also after the former manner; Seeing it should vainly enter that way, through which it ought presently to go forth: And also, if it should enter that way, it ought to enter through the

Ttttt

bowel

bowel upward; neither thus, should the gaully tincture of the dungs, ever fail although the lower passage were shut up: The Humourists therefore stick in the entrance, in proving of the question, whether the thing be: And then, they fail in the passage and separation of Gaul from the Liver. Thirdly, At leastwise from the disproportion, they might easily collect, that they were deceived: For if one that hath the jaundise, shall drink eight pints in one day, he is to make well nigh, as much of most yellow urine, whereof four pints at least should be of meer Gaul, and by how much the weaker the sick shall be, and nearer to death, by so much the deeper, their urine shall be also in yellownesse, yet not any thing bitter.

It was therefore to be measured, how much of yellow Choler may be daily expelled by urine, and through the skin, in those that have the jaundise; to wit, whether there be daily as much of Gaul, expelled through the paunch in healthy persons, especially, in whom there is a seldom going to stool: But if not; therefore, it is not Gaul, not Choler, or of the natural Humours, which is made in the jaundise; but plainly an excrementitious poyson: And by consequence, the jaundise doth not prove it self to arise from Gaul. At length, the argument of the Humourists being granted by way of supposition, at leastwise, for that very cause, they confesse, that no Choler in nature, not so much as that which is believed to float together with the blood in the veins, is made from the intent of nature, or for nourishment: but that alwayes, however it may be taken, it is excrementitious, and a certain product, which as well in its quantity, as quality, is besides nature, and the scope of sanguification: By consequence also, that Choler is neither of the composition of the blood, as neither of the intention of nature, which it hath in generating of the blood: That is, that Choler is not a constitutive Humour of us, or an entire part of the blood.

But if they shall answer; that Choler in the jaundise, is indeed a diseasy Humour, and therefore also excrementitious; but not therefore also ordinary Choler: But that I might believe them, it had behoved them, first to prove a radical difference of both Cholers: When as otherwise, only the obstruction of the Gaul is the cause of the jaundise in the Schools, which cannot change the species of Choler; since obstruction it self, hath respect unto passage, but not unto Choler, or Gaul.

Again, if the cause of the jaundise be a diseasy excrement, and a far different thing from the constitutive Choler of the blood; and not otherwise, ordinary and natural Choler; Therefore at least, it is an impertinent argument of the Schools, to be willing, by a feigned and excrementitious Humour, to intrude the necessity of a natural Humour, and to confirm a necessary Choler: Even as a gleary or gravelly water also, doth not prove the nourishment of a bone, or the making of a bone in the callous matter growing in fractures; As neither doth corrupt pus prove a generating of flesh.

What if they say, that the Gaul is not troublesome in quality, in the jaundise, but only in quantity; I pray, let them look back: Because, even on the first day, and before a manifest jaundise, those that are jaundous are ill at ease: In the next place, the quantity alone, doth then not only molest and hinder: but also the quality it self doth far more strictly hurt: For jaundous persons are straightned and short-winded, from the first day they complain of anguish in the orifice of their stomach, of an appetite as much as may be dejected, they are sad or pensive, being as it were shaken with a perpetual smal Ague or Fever, and truly diseasy, with an hard and unequal pulse; whereby a hurtful quality rather than quantity, is denoted.

Truly I remember, that two jaundous dead carcases were dissected, I being present: Yet neither orifice of their Gaul was stopped (for I curiously, thoroughly viewed the whole); but the veins of the Mesentery (to wit, beneath the Liver, and far remote from the Gaul) abounded with a yellow and dungy blood.

For Gaul was thought to be present, before it could be made by the Liver: And the excrements of the belly might thereby, have been abundantly tinged, if the liquid and yellow dung, which ought to have descended beneath, had not by an inverted order, been detained in the mesentery, and if another poyson, had not been bred above from foreign causes: For that liquid dung, is the off-spring of the second digestion, and is frequently snatcht upwards; and although the mouth of those that have the jaundise, be now and then bitter, yet their urine is not bitter. But it hath already been sufficiently declared, concerning the dissembled vomiting of Choler, that there is a strange efficient, which generates a strange poyson, originally in the stomach, with much perplexity, and not Gaul fetch back from the Liver: neither is there I say, any bitterness in the yellow and

and liquid dung; Since that, neither doth the urine which is from thence yellow, acknowledge bitterneſſe.

Sorrow hath oftentimes given a beginning to the jaundice: But the Humourists dedicate ſorrow to the Spleen: Sorrow therefore ſhall not be the foregoing immediate, and containing cauſe of the ſtoppage of the Gaul: The liquid dung alſo multiplies the jaundice, not only through the error of the digeſtive faculty: but alſo, through the vice of the diſpenſative faculty, it is ſnatcht into the veins by a retrograde motion; and that which ought to be purged downwards, is called or ſent upwards. Moreover on the other hand, the very efficient of the jaundice produceth a poiſon, by a homebred vice, no otherwiſe, than as I have demonſtrated, that through the digeſtion of the ſtomach being decayed, a poiſon is bred, which is expelled by vomite.

For in the jaundice, the excrements of the fundament do frequently look pale, and are almoſt white, and then on the morrow, they again look yellow; and again, ſoon after they are pale as aſhes, as on the day before; which thing ſucceeding thus by courſe, leaſt of all belongs to the obſtructions of the Gaul; For thoſe being once looſed and opened, there is not a re-ſtoppage, or cloſure, ſo eaſie, or imminent, and renewed afreſh.

Two things therefore concur together in the jaundice: One is an eſtranging of the ſecond digeſtion, whereby the Chyle is perverted, as well that which ſhould be regularly good, and to be changed into blood, as that which otherwiſe naturally departs into liquid dung, within the inteſtines: But the other is an alienation of the diſtributive, and digeſtive faculty of the ſtomach: For oft-times after gluttony, there is a plentiful yellow vomiting, even as ſuch a dejection by ſtool from a ſolutive potion: For it hath been already ſhewn in the Chapter above, that digeſtion erring, ſuch a bitter excrement is bred in the ſtomach, and likewiſe alſo in the bowels of children, calves, &c. For the ſtomach, and inteſtine have their proper yellowneſſe, which ſometimes alſo waxeth bitter from the digeſtive faculty erring.

But when as, with the error of the digeſtive faculty, a vice of the diſtributive is preſent, now the jaundice concurs: becauſe that which is bred beſides nature, is beſides nature diſperſed into the veins and body; which otherwiſe ought, neither to be bred, nor carried that way, but to be forced through its own emunctory places: which diſtributive faculty hath been hitherto neglected by the Schools:

Through the error whereof notwithstanding, diſverſe diſeaſes are made; to wit, ſymptomatical Fluxes, Apoſtemes, witherneſſes of the parts, Oedema's, &c. eſpecially the jaundice, in the limits of the body: For the liquid dung, which otherwiſe is naturally generated after a ſeperation of the more pure chyle, about the end of the Ileon, laſt of all, alſo before the meer dung, in the gut Colon, doth now fore-timely begin, from the empty gut, and is beſides nature, turned into that yellow excrement, yet not bitter, ſuch as is bred in the ſtomach) whence a right is ingendred in it, of climbing into the veins of the meſentery: Therefore the excrements of the belly are of an aſhy colour, they being deprived of the liquid dung, and tinged yellowneſſe naturall unto them.

1. For the Schools underſtand the Gaul and Choler to be Synonymals.
2. That the cheſt of the Gaul is ſhut in the jaundice, where it inclines unto the gut Duodenum.
3. Therefore, that the filths of the belly being deprived of a due portion of Gaul, do wax pale.
4. Therefore that the Gaul, which ought to depart through the fundament, is over-proportionably and immoderately co-mixed with the urine, through the error of its paſſage alone: which blockiſhneſſes of credulity, have cauſed the fundamentals of healing to be turned aſide, and have brought great deſtruction on mortal men, no leſſe than they have maniſeſted inconfiderate raſhneſſes.

For firſt of all, it is maniſeſt (the which I have elſewhere proved concerning digeſtions) that the dung of man, although it be little, or much yellow, yet it is not therefore bitter, as neither is a jaundicy urine: For dogs eat the yellow dung of Infants, as if it did as yet repreſent unto them the favour of milk; yet if but ſome ſmall drops of any Gaul be co-mixed with this yellow dung, not any thing thereof is licked by a dog: Therefore the Schools confeſſe Choler which is ordinary and neceſſary, to be a natural excrement of the blood:

The generation whereof, notwithstanding, is not intended by nature, but is diſeaſy

beside the instincts of a vital nature, and by accident. What if the mouth of him that hath the jaundise tasteth bitter, doth it therefore, argue Choler? In the jaundise, a most yellow urine tasteth not bitter; therefore it is deprived of Gaul and Choler. The mouth, in fear, waxeth presently bitter, with a saltnesse; But fear hath not obtained any command over the Gaul, that a dread being conceived, it can be powred forth into the mouth: For if in the jaundise, the Chest of the Gaul be so shut beneath, that no Choler can flow unto the Duodenum: therefore, neither is the mouth bitter in the jaundise, from Gaul being drawn upwards from the Duodenum, or empty gut, seeing there is not another passage any other way, whereby Gaul could ascend into the mouth.

- 13 Oftentimes also in the jaundise, after ash-coloured excrements of the belly, they void yellow ones: why therefore doth not the jaundise cease, if the cause thereof now desisteth? What if in the jaundise, Rhubarb, or any other drawer forth of Choler being received, whatsoever is cast forth shall yeild the testimonies of yellow Choler; why therefore, a Cholagogal medicine being taken, is not the jaundise ended, if Choler slide down thorow the bowels at the will of the Physitian? What if a forreign ferment, or poyson doth oft-times transchange and cast forth the whole blood, and flesh it self, by a flux, into a stinking and yellow liquour, and the which, the Schools say without controversy to be Choler:
- 14 If (I say) also, from the stinging or biting of some Serpent, any one suddenly falls under the jaundise; shall therefore the little bag of the Gaul be forthwith shut? Who rather from hence, shall not judge, that a certaine co-like poyson lurketh in every jaundise as the causer thereof, which estrangeth the digestive and distributive faculty? And so that Choler is not naturally from fire, as neither from a right digestion, and much lesse, from the fruitfullnesse of native heat: but that it is made in nature, plainly from a disgracefull title:
- 15 And therefore, that the excrements do wax pale, yellow, red, and black, no otherwise than from a vice, as well of the digestive, as of the distributive faculty? For the dung of Infants is yellower than that of those of ripe years, yet they are not therefore reckoned in the Schools, to be more Cholerick. The yellownesse of an excrement therefore, is that which ariseth from the vice of its own putrefaction.
- 16 What if therefore, the jaundise be not from a stoppage of the Gaul; shall not consequently, medicines for the unstopping of the Gaul, be in vain? For so, as some Serpents, do from a property, cause the jaundise; so also some Insects do likewise cure the jaundise, as also some Simples being only bound on the outside of the body: To wit, as they take away the poyson which estrangeth the aforesaid faculties; but not that those wormes, or simples, do presently stop, or unstop the chest of the Gaul.
- 17 Let them therefore remember, that curative betokenings are not fitly drawn from things helpfull, and hurtfull; but more fitly, diagnostical or discerning ones: And the which I have elsewhere, more fully, professedly manifested.
- 18 The efficient cause therefore of the jaundise, is a poysonous ferment besides nature, which so badly affecteth the Pylorus, that the digestive and also the distributive faculty are alienated: And that poyson sits either in the Duodenum, or is communicated farther of, from the Ileon: so now and then, one that is bitten by a serpent, is straightway afflicted with the jaundise: But not that that stroak in the skin hath presently stopt up the passage of the gaul into the empty gut.
- 19 Therefore the jaundise is cured, by the floures of Marigold, Dandelyon, and of many other the like things being applyed: oft-times also, by some Antidotes agreeable to the Pylorus; Such as are Palmer-wormes, earth-wormes, yellow-wormes between planks, and those things which do powerfully cleanse the first region of the body.
- 20 For neither doth Rhubarb, Saffron, Gourd, the sharp leaved Dock, &c. Cure the jaundise as they are yellow: but their yellownesse rather shewes their ordination to be for the wiping away of the poyson: For Signatures bewray the internal Crasis or constitutive temperature of a thing; but the Crasis it self doth not discover the thing.
- 21 A certain man of eighty years old, and father in law to a Physitian of *Bruxels*, for two years space continually dropped with a Strangury: He was therefore thought to have the stone in his bladder: At length his dead Carcase being dissected, it was found to be free from the stone: That Physitian presently boasted, that he had broken away the stone from

from his father in law, by offering him stone-breaking things: But he had not freed him from the dropping strangury: But his gaul was filled with some clots, without the jaundise: but a defect of the Spleen causeth the strangury of old men, As I have elsewhere proved concerning digestions.

For the Jewes complain very much of black Choler, and grief: But they make use of the stone which is sometimes found in an Oxe his Gaul, it is somewhat yellow, and swims now and then in water, although somerimes, it be the more hard and black: But the Oxe perisheth not by the jaundise, but by the hammer; neither is he ill at ease from yellow Choler, although the chest of his gaul be stopped up with a stone large enough. Lastly, the Oxe that is fed with continual grasse, is stopped in his gaul: Therefore so great a use of grasse roots, in all Apozemes, is wholly ridiculous.

1. Before therefore, I shall grant the gaul to be daily sent down for tinging of the excrements of the paunch, it ought first to be manifest, that there was Choler in the nature of things.

2. And then, that the excrements of man are endued with a notable bitternesse: The which notwithstanding, is elsewhere proved false, concerning digestions.

3. It ought to be manifest, that the same paine which tingeth the urine and filths of the belly, is not naturally generated in the very passage of the membranes, which is called the intestine; even as I have made manifest above concerning a Calf.

4. If therefore the urine, and dungs are ordinarily, and naturally yellow, and yet are not bitter; therefore not from gaul, or Choler: Therefore it is no wonder, if such an Efficient of nature erring, such a tincture becomes the more plentiful, and so that in the more heightned jaundise, the urine waxeth also, more intently yellow daily in a jaundous person: neither is it a wonder also, if from the efficient and distributing cause erring, such yellow excrements are derived throughout the whole body, and that the jaundise, and at length also, death do arise: For if in a gluttonous stomach there be made a bitter yellownesse, from its digestion erring: and that, as well without as within the the jaundise, as well in an healthy as feverish person, and as well in an obstructed, as open gaul; In the next place, if in stopped up gaul, stones clots, &c. do appear without the jaundise; If in the jaundise, the urine be most intently yellow, and tinging, without bitternesse and gaul, and all these things under the error of the digestive faculty alone, and the distributive offending; It is no wonder, that the excrements of the belly look pale through a vice of both faculties: Because, it is the part of same faculty, being in good health, to beget [this something] and of the same being ill at ease, to make [this something variated].

At length, a pale excrement of the belly, and urine of a yellow ruddy colour, in the jaundise, do not indeed accuse of a co-mixture of gaul, as neither of Choler; but of errours committed in transchanging, and distributing: For specifical remedies of the jaundise being given, especially in a small quantity (as they are wont to be) should not profit, if the lower (that is the one only) orifice of the gaul (which is supposed) were suitably and totally shut (for whatsoever is not totally shut, layes open sufficiently to the gaul flowing thorow): For an emunatory place being so shut, as it is no way an expulsive of its own superfluities, surely much lesse shall it be an attractive, or admittive of a foreign remedy, and that being first transchanged in the stomach: And therefore also plainly in vain.

Again, if there were any upper mouth in the chest (which there is none: for a passage is not found to be but beneath) surely that should be least of all fit for drawing of Choler; and much lesse, in so great a plenty of Choler, as is supposed in the jaundise: Therefore Choler ought to be drawn through the Liver, neither could so great a quantity of excrements be dismissed through the little bag of the gaul it self, which is judged to be void of pores above; and so, there should not be that, from whence the lower pipe might be stopped.

Then again, from hence it followes; if there were any Choler, and that Choler were not sent from above, through the chest of the gaul, that a remedy also, against the jaundise, cannot slide from above into the chest, nor likewise to be admitted from beneath (because it is supposed to be exactly shut) and of necessity, any jaundise shall always be without hope of curing, because without a remedy.

Then at length it is manifest from elsewhere, that the liquour of the gaul is a meer vital bowel, but not the Choler, or daily excrements of the Liver: Therefore, if there be not yet found a passage conspicuous, and not yet proved to be from the Liver,

thorough the chest: why therefore, the passage of the little bag beneath, being stopp'd up, should the whole body presently re-gorge it self with gaul: for truly, this presupposeth as much gaul to have been first prepared by the Liver.

- 29 Furthermore, if yellow Choler, which they imagine to swim on the blood let out of the veins, doth as well tinge the excrements of the belly, as of the bladder, and that Choler be scarce palishly yellow; certainly, that shall never be able to tinge or dye a jaundous urine, into so thick and full yellownesse of colour: Seeing that for which every thing is such, that ought as yet, to be more such: And far is it, that meer Choler, which ye say is ordinarily generated together with the blood its cousin German Humour, should be more coloured than the urine of him that hath the jaundise, which not only, is not Choler, but scarce one part of Choler is reckoned to be added unto fifty parts of the Whey.

Neither in the mean time, doth the urine of a jaundous person, therefore, ascend scarce in its fiftieth part, unto the tincture of meer Choler: Therefore if the urine (which in its own body every where, and always materially representeth drink) doth as yet borrow its colour from gaul and Choler: the tincture of a jaundous urine it self, ought in its body to exceed the tincture of gaul, yea and of saffron, at least by thirty fold, and the gaul should be thick like the yolk of eggs; The which, seeing it is not of the nature of Choler, or gaul, therefore neither shall the tincture of a jaundous urine be able ever to be from gaul: And this argumentation, is from number, extension, measure, and thicknesse.

- The Schools therefore ought to have regard unto their own positions concerning the obstructions of the gaul; and they should easily finde, that there is not about the hundredth proportion of gaul or Choler daily bred, (although it be granted, that the little bag of the gaul be stopp'd, and that gaul is not thrust down unto the excrements of the fundament) unto that which is voyded by the urine alone: And then, that there is not a reason why the jaundise growing great, the urine, and colour of the habite of the body should wax great and be increased, when as otherwise, sanguification, and the generating of gaul happens to be lesse, daily, death being urgent. And which is more, the urine of the jaundise is not bitter (which thing, even one only smal drop on the top of the tongue, may cleerely enough signify): but it should be far more bitter than gaul, if it should derive its tincture from this, or the gaul ought in every urine, to loose its own natural bitternesse; Both whereof are alike absurd: and seeing otherwise, all bitternesse is banished from all other urines, (but it is a most absurd thing, to beg all yellownesse of the whole urine, from gaul or Choler alone, and yet that in the mean time no urine is bitter) at leastwise, bitternesse in a jaundous urine, should be a very forreign quality, nor to arise from Choler: Which is to say, to arise from a forreign excrement, bitter in it self (such as is that, which is now and then rejected by vomite, as well in healthy as in sick persons) but not from natural Choler.

- 31 But in constraining the Schools to measure; A yellow heart, whereby in one only day at least, the urine is tinged in the jaundise, might infect as much dung with a full colour, as is cast forth through the belly in forty days: But it should be sufficient, for so much colour to abound in the urine daily, as Choler doth infect of the dung, every day: Therefore the obstruction of the gaul, cannot be for a cause, why more of tincture and gaul is generated by forty fold, if the tincture of the urine, and yellownesse of the whole body are beheld at once.

- 32 Yea, when the other troop of absurdities might be excused, yet by the jaundise more of yellow Choler (so I now by a liberty, call that dreg) is daily dispersed throughout the habite of the body, and also through the urine, and more of gaul by tenfold is daily thus expelled, than there is of blood bred.

Therefore, it had at leastwise behoved the Schools to teach, why a detainment, and obstruction of the gaul doth multiply the generation of gaul, if they will not at once grant, that that generation of such gaul and of all feigned Choler, is otherwise, excrementous.

- 33 And so, that Choler, and a quaternary of Humours is feigned; But whatsoever of these excrements is generated, that it is partly of an unnamed poyson, which they have falsely believed to be Choler, being deluded by the jaundise, and the chances of the foregoing Chapters.

Therefore they have accounted a narrow search into the poyson of the jaundise, to be in vain, seeing they thought that Choler to be that which did abound only in quantity;

quantity, and otherwise, to be a natural co-partner of the venal blood. Ah, I wish they had first examined, that yellow Choler (such as they shew to swim on the blood let out of the veins) cannot more deeply tinge the urine (which otherwise, is watery, from the nature of its own Whey) than Choler it self is tinged, and as yet far lesse: And that an ordinary urine, of a mean and temperate yellownesse, is notwithstanding more deeply tinged, than the aforesaid sapper-swimming Choler it self is: That in the jaundise, its colour is fortytimes more full, and tinged, than that it can be hoped to be dyed by the aforesaid Choler: And that by how much the more disease, and nearer to death the jaundise is, by so much the urine also is more filled with a deep or yellow yellownesse.

Neither yet, is there a reason why more of Choler should be daily generated, while as there is a lesse necessity thereof, and the natural heat in the Liver lesse: Why there should I say, be more of Elementary fire, by how much death is nearer, and why that fire, if there should be any, should be nearer to its own choaking: And that while they rashly say, hony to be wholly turned into Choler or gaul, in a Cholerick, strong, fiery, manly and valiant constitution, which otherwise, in a sanguine person, is made totally blood.

And so also, that they being constrained by their own and involuntary confession, do not see that the generation of their feigned Choler proceedeth on both sides, from some poysonous indisposition of the body, and the which being at length increased, produceth much more plenty of those excrementitious filths, than of blood, yea than it is wont to do a little before.

Since, as in the mean time, there is no necessity of such Choler, but very much necessity of blood in the jaundise; May they not seem from thence, to conclude.

1. That nature in its greatest health, alwayes erred in its own ends.
2. And so also, that the Creatour thereof had erred.
3. And that she should not cease, to make a most plentiful quantity of gaul, while as she most greatly abhorreth that, and should have the least need thereof: That the making of Choler in the Schools, is from a diseasifying cause; but not from the integrity of nature: That whatsoever they call Choler, is neither Choler nor gaul, nor one of the four feigned constitutive Humours of us; but, the gaul being excepted, that Choler is alwayes a meer dungy excrement, if not also, together therewith, defectuous and poysonous. Therefore Choler never existed in nature: But the gaul is a prevalent bowel, in the nature of an original or first-born liquor, greatly vital, and most exceeding necessary. Choler therefore, is wanting in whole nature, therefore also for the jaundise: But the disease called Choler, whatsoever it toucheth with its poysonous ferment, it deties it, and transchangerth it into a poyson, without ceasing. The whole invention therefore, of Choler, is frivolous, false, and pernicious.

But the nest or shop of the jaundise, is from the Pylorus even unto the end of the Duodenum. For I remember, that a Pike-fish, being at sometime opened alive in the back, from the head to the tail, and bound a-crosse, upon the region of the stomach, within a few hours, his putrified carcase stank, and all his flesh which before was most white, became yellow.

The comon sort of Physitions supposed, that he had drawn Choler from the jaundous person: But I suppose, that the live fish had putrified with the heat of him that had the jaundise, and that he had borrowed his yellownesse from corruption: That the excrement tinged on the skin, in the jaundous person, was a mortified poyson, no other wise than as the flesh of the fish was: For the fish was so stinking, that it was despised by a Cat: I therefore healed the man by some calcined Alkali salts. Let it be sufficient to have spoken these things, concerning the falshood of Humours, and the miserable snare of the Humourists: But other things which concerning the falling down of Humours, having regard hither, might offer themselves, I will elsewhere perfectly explain in a particular treatise, concerning the toys of a Catarrhe.

But last of all, that for black Choler they are wont to accuse the Hemerhoides or piles; in the next place, the Menstrues, and Cancer of the Dugs; Surely that I despise under silence, as unworthy of an answer, and as unprofitable trifles, in a great compassion of the rash belief of my neighbours, and also of the blindnesse of the Schools: For truly, herein they retire from the terms proposed by themselves, as well in making of blood, and sliding down to the spleen, as in passing from yellow Choler into black.

Because

Because the fundament veins, and veins of the womb, not always, daily, or in any place; but only about the utmost passages of those veins, blood, being otherwise good, is made malignant, and defiled in those places, and not before: but not that it was already before degenerated in the Spleen, and sent into the utmost end of the Fundament.

Even so as also, whatsoever the Schools devise for the establishment of phlegm, concerning the *Pose, Cough, Asthma, Shortnesse of Breath, Pleurisie, Toothach, &c.* All that, I will demonstrate in its own place in the treatise of the toys of a carathe, for ridiculous dreames of Paganisme: But now it hath seemed sufficient unto me to have shewn, that no phlegm is contained in the fellowship of four humours: and that which is dashed forth from disease causes, which is snivelly, and the which they have hitherto perswaded themselves to be ejected like phlegm, it is sufficient now to have shewn, that that very thing hath undergone the title of an excrement, nor that it is in any wise to be ascribed unto the family of a vital Humour.

Let the Lord Jesus be between me, and the interpreters of these things.

FOR

FOR AN.

ARGUMENT

Of the book, a Poet hath thus long against the
Hugonots, churishing after Christian blood.

Most famous Captain, why in many Doctors dost thou try
It is much that canst confute in one; the other none [unjust]
To prove, dost thou not see the reason thou hast the body crucified
This canst thou say, and so thyself, the crucified, a miracle:
Who art of blinding Galen dost in sight the crucified take
They all against one body fight, and I, a single writer
I, a man of medicine, professing as an Epicurean
Dost thou believe that I, a Poet, have a healing power
He was a Belgian Prince by blood, but I, a Poet, by the noble
After the Spanish mode: to the Dutch that mode, a noble
It is noble a little to his Tomb: here lay a Captain dead
O'er whom Mars could not ought prevail while blood was in his veins
When bloody war could not prevail, I, a Poet, could by lines
Thus last than Hugonots a death, Mars was in words [by chance]

FOR AN
ARGUMENT

Of the book, a Poet hath thus sung against the
Humourists, thirsting after Christian blood.

Most famous Captain, why in many Doctours doth thou trust,
It's much thou can'st confide in one; the other rout [unjust]
Do hurt, dost thou not see the veins throughout the body emptied,
This cut's, that burn's, and so by Art, the maladie's incensed:
Who ere of daubing Galen doth in ought the counsel take,
They all against one body fight, and B' Art a slaughter make.
A rout of Medicine professors slew an Emperour,
Dost thou believe that Physick Doctours have a healing pow'r?
He was a Belgian Prince by blood, but Physick't by that rable
After the Spanish mode: to th' Dutch that mode's unprofitable.
I'll adde a little to his Tomb: here lays a Captain best,
O're whom Mars could not ought prevail while blood was in his breast:
What bloody war could not perform, Physitians could by lance,
Thus less than Hippocrat's himself, Mavors is made [by chance.]

THE PEST

Reader, the Title which thou Readeſt, is a mournfull
Terrour, affixed to the doors, within it ſhews death, the
kind of death, and ſcourge of men: ſtand ſtill and enquire what
this may betoken? What the Epigraph of the Plague-Grave
will have it ſelf to be.

I have departed under the Anatomy, not dyed, as long
as the ill-Counſelling envy of the ſcoffer, and ignorant luſt
of men ſhall cheriſh me.

THEREFORE HERE IS

No Funèral, no dead Carcaſe, no Death, no Skeleton,
no Mourning, no Contagion.

GIVE GLORY TO THE ETERNAL,

That the Peſt hath now fayled under the proper puniſh-
ment of an Anatomy.

THE FIRST

The new method of teaching is a most useful
method, which is the best, the
most simple, and the most easy to be
understood, and the most useful to the
world.

The new method is the best, the most
simple, and the most easy to be
understood, and the most useful to the
world.

CHRISTIANS.

Dear Reader.

Have always, even from a Child, sought after the truth, above every delightful thing; because I every where found every man a Lyar; and so that from the impiety of the world, all false, ignorant, devised, deceitful things, and things full of impostures have been invented: And when I had fitly searched into all States, Religions, and Conditions by their individuals, I saw indeed the certain and unchangeable truth, in numbers, and measures: In the next place, in created things, I found indeed the essence and properties of things to be true and good; but the truth it self, however I inquired amongst men, I nowhere found: I greatly grieved that truth had hid it self from my capacity, as not knowing, that that was my own vice, but not the fault of things.

At length, when I had considered that God himself was the naked truth, I took the Gospel-book in my hand; wherein although I every where noted singular verity, yet I found the interpretations thereof to be according to the will of the flesh; Yea, at this day, I have noted some to be diligently studious to excuse excuses in sins, especially in those of great men: And so, the truth of the Gospel is reckoned to be professed; but not consented unto as it ought to be: For there is none who having two Coats, puts off one, that out of meer love, he may cloath the poor man as if Christ were present, therewith: None turns the other cheek to him that strikes him: And so, Evangelical truth, through the endeavour of some, is at this day grown out of use, among Christians. In which consideration, when I once had tarried out almost all night, after the studies of some years, and very many anguishes, I resolved with my self, that I would every where assault the Plague freely, which had then invaded our Country-men, and the which all fled from: And although I had on every side contracted the most choise remedies out of books, into a breviary, and also had remedies described by others, at
hand

To the Reader.

hand; yet I experienced them all to be void, feeble, and vain: For the forsaken sick, and poor, did oft-times utter their vomitings and belchings upon me, and breathed out their soul between my armes, to my grief: but God preserved this ignorant and unprofitable servant. And at length, I comprehended the nature, progresse, and properties of the Pest, to be far different from what the Schools had hitherto understood them to be: Because Doctors and writers themselves, do first run away: and what things they have here and there compiled out of diverse Authors, they do equally extol and commend to the ignorant, as most exceeding good, and the which, from their own ignorance, they so judge to be: And so, all their doctrine is supported by the foundation of supposition. In the meantime notwithstanding the knowledge of a Pestilent poysen, hitherto scanty, is desired; and remedies are required, which their gift being unchanged in the first shops, can overcome the contagion of the poysen; whereof nothing hath hitherto been dreamed by the Schools.

TUMULUS

Tumulus PESTIS.

OR THE
PLAGUE-GRAVE.

CHAP. I.

Of what kind the Pest or Plague is.

AFTER a pensive lodging out all night, a dream befell me : and since night unto night sheweth knowledge, I have thought that a dream doth contain knowledge : Therefore I willingly submit my dreams unto the judgment of the Reader.

For I beheld my self to be in the vaults without the city (they call them Grotts) I saw Dædalian Labarinths, in some place, Arches threatning a cleft and ruine. I had called them the porches or galleries of *Pluto*, wherein inveterate or long accustomed darknesse, and a thick aire, wearied with long rest, suffers not the light of a candle to shine a-far of : For the thicknesse of the air did so meet with the Gas of the earth, that the flame of a wax-candle would scarce shine but a few paces from thence : For the voice becomes so dumb with a duskish sound, that not far of from thence, an out-cry cannot be heard, and the more dull sound seemes to resemble, not a voic, but the shadow of a voyce. For nothing is there which is vital, except a company of Bats, their nests being adjoynd or knit fast in the Arches of the co-heaped rubbishes.

Alas ! a sad spectacle, the Image of eternal death, where the seat of night-thieves is : Wherein, if thou shalt chance to hurt one of its cruel inhabitants, thou art deprived of candles, and presently of life, unlesse, thy light being extinguished, thou prostitute thy self as humble, and feign thy self as dead. For those lurkers, being the natives of obscurities, do not endure to be obtained, or corrected by any ; and much lesse, to be driven away from their seat : They call it an injury, to have the light brought against them ; because with them, they neither have light, neither do they love it : under doctrine and correction, not issuing out of their nests, they cry out for revenge, and they gape for it with conjoynd votes.

Xxxxxx

For

For how strong are they because and when they are very many? How bold are they in the Age and Kingdome of darkness? and how unmild, where all things favour their own wishes and flyings? For our breath there smells of so great an hoary putrefaction, that delay presently tingeth us with paleness. And indeed, it is familiar to the Mines of Metals, that except the soil be frequently pounced, and new air do breath on it from the Sky, mountainous Inhabitants do certainly perish with a blind Gas: but if they shall not lodge out of their house all night, they at least, do contract a disease deplorable even for their life time: For therefore, they are wont, that they may preserve the life of mountainous Inhabitants, to blow in new ayr, and to blow out the hurtful by Engines. But in the Roman Vaults they seek not for Minerals; therefore also, they want an Arlenical Gas: For there, frequent Sepulchres are found, which are thought to be those of Martyrs who gloriously died: Therefore, I dreaming, began to doubt, whether fled Truth, and not to be found at this day, had made its grave with the Martyrs in the same place? the question smiled on me sleeping; for the most High created the Physitian, as also, medicine out of the earth. I have therefore deemed the truth of medicine, and knowledge of a Physitian, to have hid it self in the stable Foundation of Nature, and the more hidden Sepulchre, from the unworthy and defiled beholding of Mortals, and to have forsaken our commerces, and to have overwhelmed it self in many labyrinths and perplexities; so that, by reason of the smallness of light which is social unto us by nature, truth remains covered over with darkness, and hedged about with difficulties. And the worst thing which here at length offers it self, is, that this Grave of Truth is kept not by a good Genius, or Spirit, but by the unhappy Birds of the Night: therefore the spirits of darkness are to be supplanted: But whosoever he be, who strives the less to applaud those keepers, he presently experienceth the violent power or tyrannical rule of those, who under the shew of piety and quietness, keep these Kingdomes of *Pluto* as their own. But seeing they themselves come not into the light of truth, they also suffer not others to enter, unless they prostrate themselves as humble unto them. For any other person is straightway encompassed by the powers of darkness, the Enemies of the first Truth, who under the pretence of godliness, challenge the Legacies of their own Sepulchres to themselves; because they boast, that the Kingdome of Truth is in their possession: And therefore, that the command of Learning, Sciences, and the powers of great men, are assigned to them. For these, being neither Birds, nor Mice, have obtained a middle and hermaphroditical kind, and they go, as it is in the 20th of *Luke*, *They pierce the houses and possessions of Widows; they lead away after them, poor silly women laden with sins, &c.* Surely, every such business walketh in darkness, and all their endeavour is with a Noon-day Devil.

Truly, I saw not a means of opening the Sepulchre of Truth, but with long leisure: but this thing, hateful spirits, even since the dales of *Arias Montanus*, have not permitted to good men: Wherefore, that I might seasonably, and with the profit of my Neighbour, put that in frequent practise, I decreed to withdraw my self from the vulgar sort, and under the light, throughly to knock the Vaults of Nature full of holes: And least I should labour in vain, I disposed of my glasse basins under the light, that by a dumb found, I might discern the Vault of Nature underneath. I endeavoured by the unwearied pains and charges of forty years, to break the rocky stones asunder with the Axe, Crook, Fire, and sharp liquor, that light may flow in from heaven, and that the Night-birds which presume to keep the Keys of Sciences, and the narrow passage of Truth, may vanish away, or betake themselves unto a corner, out of a Court-like conversation, and the pursuances of courtesies: or at least, that they may no longer hereafter hinder mortals who are diligent searchers after truth. For this mixt kind of Monster noyseth abroad, that it is more excellent than all Birds; because they begin not from an Egge, after the custom of other Birds; but do nurse up their Young with a longer sucking at the Breast, and do cast those out of the Nest which they think are not sufficiently profitable unto them.

They boast, I say, that they are therefore the most quick-sighted of Birds; in this respect, because they also see most clearly under darkness. Alas, thus is our Age deceived by darkness! But they feign, and perswade the vulgar, that Truth is in the shade, within their own vaults; who in the mean time, being alwayes learning, do never come unto the knowledge of Charity; because they endure not the light that is perfectly learned by alone and naked Charity; and therefore, they alwayes weave to themselves the Wiles and webs of darkness. Truly, it was necessary for me to rent the bowels of the Earth, and to break its Crown: For truly, *Galen* hath seemed to me, to have entred into the Vaults with a slender Lamp; who being presently affrighted, stumbled in the entry, and

at first almost fell over the Threshold: Therefore, his Oyl being lavishly spent, he returned to his own, and told many things confusedly, concerning the Sepulchres, which he had not perceived, nor known, nor believed, although he had seen them. All from thenceforth, boast rashly among their own people, that they know many things, who saluted not so much as the Threshold of Nature, except at a far distance, from the relation of *Galen*. In the next place, *Avicen* with his company, although he became more cautious by the viewing of *Galen*; yet he entred not much deeper, but looking behind, about, and above him, and being taken with giddiness, his foot being dashed against a stone, fell headlong down: but returning, he boasts in a Forraign Dialect, that he had seen far more than his Predecessors: The which, when his followers understood, and stuck to, they chose a certain one of them for a Standard-Defender; they all of them had rather fight for the glory of their sworn Prince, than that they would themselves enter the passages: as if the mind of man, that is free, being readily inclined like unto Clients, had forsworn liberty: Therefore none having afterwards endeavoured to enter, and being content with the first Boasters, they prefixed on their Centuries, that themselves were to fight for the glory and Trophy of a matter not yet known; but as many as came unto the entry, being as it were fastiously addicted unto the first Patron, and insisting in the steps of Predecessors, presently fell down together.

They dreamed that they were entred; at leastwise, they were deprived of light and help for removing the darkness of so great an heap. Others also, afterwards hastened toward the Vaults, but they brought not the light with them, they perceived their Oyl to be extinguished, and snatch away by the Enemies of the first Truth, and humane health, and Inhabitants of darkness. At length, *Paracelsus* having entred with a great Torch, fastened a small cord to the wall, about his first paces, which he might follow as a Companion, and Reducer of the wayes; he aspiring to pierce whither the footsteps of mortals had not yet taken their journey. The rout of Birds is presently amazed at so great a light, it thinks that *Prometheus* had entred; it dares not, nor was able to extinguish the Torch, yet it secretly attempts to do it. This man seeth very many Monuments, he is long and freely enlarged, he fills the entries with smoak, and while he is intentive, as a greedy devourer of truth, his strength fails, his Torch falls, his light is extinguished in the middle of his course, and he is as it were choaked with fumes. I a poor miserable man, have at length entred with the least light of a Lanthorn; and that nothing might hinder, and that nothing might detain my hand from the work, I indeed refused a Rope, and hung my Lanthorn at my girdle, but a Crook followed at my back, making a path the rule of my return: Therefore insisting only in my own footsteps, I there saw far other things than the foregoing company of Ancestors had described.

But because I was alone, strength was wanting for so difficult weights, and I having endeavoured many things, the rout of Bats being against me; at length, after the manner of the former, I departed without fruit; yea, far worse; because through long delay, the light was darkned unto me, and my eyes afterwards refused to bear any further light; for why, because they had now too much accustomed themselves to darkness: Even so, that unless I had wholly abstained from my stubborn intent, the heavenly light of the day had profited me nothing: at leastwise, this one only and most true thing I had learned; that we all having trusted only unto humane aids, did walk in thick darkness, through unknown ways, most difficult windings, and paths of the night, imitating the industry of a few, and those badly to be trusted in: neither that at length we did bring any fruits from thence, except the light badly consumed, be-darkned eyes cheeks looking pale with greyness, confusions of mind, presumptions of vanity, and the image of the night at hand, full of terror and despair.

Moreover, I discerned, that all sorts of Knaves and Harlots, Deceivers, Jews, and Tormenters, when as they had once intruded themselves by their own rashness, they were soon, by boldness, raised to a degree: For I have not found in any a greater liberty, more ample rashness, more cruel credulities, more thick darkneses, and more frequent confusions, than in the most noble of gifts; wherein, it is free for any one to kill, if the murder be involved in the Cloak of a succour, and the party slain be covered with earth. Therefore I begged of God, that he would vouchsafe to set a bound in so wicked naughtinesses, which they committed against the Divine Image of his Majesty: But soon after, I discerned the vanity of my desire: For truly, as long as mens own profit holds the superiority, and medicine is exercised as a Plow, they contend in vain, who endeavour to compose my Christ the Father of the poor, with Mammon.

I praised those Cities in times past, wherein it was not lawful for an undiscereet Col-

ledge of Physicians, to rage in a drunken manner, on the health of their Neighbour: But afterwards, I laughed at my own blockishness, because they were excepted who cured freely: Whence I learned, that the gain of Physicians had provided that Law for themselves, and that mans own gain would every where vitiate the Laws of Charity, that none would from a certain hope, be found for the future, unto whom that exception might square.

I saw therefore, that in the custome of Laws, defects grew over, and that Laws were rendred barren of juice or virtue: and surely my stupidity was by so much the greater in this, because more gross errors in curing are no where committed, than those which even Chair-Physicians do through a punishable ignorance commit; even as in my whole work I have endeavoured, and been ready to shew mechanically by the fire, practically, and by all kind of demonstrations. And indeed, but a few ages ago, arrogancy, sloath, and the extinguishment of Charity sequestred a Chyrurgion from a Physician: wherefore afterwards, servants handled manual instruments and operations; as if it unbeseemed a Christian to help his Neighbour with his hands. In the mean time, some Noble Matrons healed many defects with their own hands, that were despaired of by Physicians.

Truly, after that the Studies of ambition and gain were practised, Charity grew cold, Mercy was extinguished, Art perished, and the Giver of lights withdrew his gifts, the number of our calamities increased, and Physicians were made the Fable of the vulgar; Truth remained buried in the grave of Science, and instead thereof, a confused kind of brawlings arose, being discursive, which was accounted for doctrine. For Physicians described, and drew to themselves the whole Army of Diseases, almost grieving, that the Catalogue of them was as yet so small: For they being allured with the facility of the Art of Galen, promised to measure all diseases by the Geometrical demonstrations of degrees of heat, and cold, and to heal them all thereby. Chyrurgions also, as well the Modern as Ancient, from an imitation and emulation of these, largely and widely treated promiscuously of all diseases, snatching the cures of them all under themselves, in the sight and despite of their former Masters: Because, at first, and from the root of Medicinal Ordination, all things belonged to be cured only and alone by Physicians; but unto Chyrurgions afterwards, only by permission, and from favor. Both of them have remained under a confused

strife, the which I cannot, nor do I intend to put an end unto, as being assured, * That a Physician chosen by God, his own signs shall follow, and wonders for the Schools: For he shall prepare, to the honour of God, his free gifts, to the comfort of his Neighbour; and therefore compassion shall be his Leader: For he shall possess truth in his heart, and knowledge in his understanding; Charity shall be his Sister, and the mercy of the Lord shall enlighten his ways: For he shall employ or bestow the grace or favour of the Lord, and the hope of gain shall not be in his thoughts: for the Lord is rich and liberal, and will give him an hundred-fold, in an heaped up measure. He will fructify his works, and anoint his hands with blessing: He will fill his mouth with consolations, and with the Trumpet his word, from which diseases shall flee: He will fill his life with length of daies, his house with riches, and his Children with the fear of the Lord: His footsteps shall bring felicity, and diseases shall be in his sight, as Snow in the Noon-day of Summer, in an open Valley: Curse and punishment shall flee away, and health shall follow him behind. These are the promises of the Lord, unto Physicians whom he hath chosen: These are the blessings of those, who walk in the path of mercy: Because the Lord loveth those that work mercy, and therefore will he enlighten them by his Spirit, the Comforter. For who is liberal as the Lord, who gives many things freely, and for some small matter, bestoweth all things. Blessed is the Lord, who saves only the merciful man, and who saves him that is to be saved, freely. But consolation shall meet the merciful man, in the way of hope; because he hath chosen a faithful Master. But indeed the Greeks, and soon after, the Arabians, instituted the cures of infirmities, without the distinction of the person of a Chyrurgion from a Physician: And those Heathens rising again from the dead, shall at some time, confound Christian Physicians, for their sloath, covetousness, and pride: For God reserveth the choice of a Physician to himself. But the Schools being willing to ease God of this work, have taken on themselves to instruct Schollars, any, and without difference, and have proposed unto them an Art placed in the daily reading of books, and in disputations: wherefore they have read the books of Galen, Avicen, and their Interpreters; and then they have rowled over Herbarists, the images of Herbs being deciphered to the life: And the which, if they have not yet therefore known from thence, the studious are dismissed to the shops, and to the gatherers of Simples, with a command

command, that when they have well known the Effigies of Simples, they return unto their Lectures, which they by much and long study have collected out of divers Authors, that they may learn the powers or virtues of Simples and Compositions, and also their applications. In the mean time, perhaps ye shall see the dissections of dead carcases, and ye shall hear (as they say) *Galen's* method of Healing, his use of the parts, and differences of the Pulses: Likewise our Commentaries on the ninth Book of *Almanzor*, according to the common rule of Practitioners.

In the mean time, learn ye problematically to dispute subtilly upon any proposition; and so, within three years space, ye shall be transchanged into learned men. The Schools, in the mean time, being as it were ashamed, laying aside the name of Physician, promise some higher thing unto their young beginners, when the three years are finished; which is that of a Doctor.

Therefore, after that Art was raised up into a Faculty, Religion, and Profession; pride crept in, covetousness intruded gain; whence also there was a mutual hatred betwixt Physicians; which things brought with them all inclemency on the sick. Moreover, at length, pride, for the most part, super-excelled covetousness in those that were blown up with the letter, and lucre: wherefore a Physician, promoted his household servant, who had known how to comb and shave a Beard, into a Chyrurgion; accounting it a shameful thing for him who had rowled over so many books, to bind up an Ulcer, or repose a broken bone: For all vices have that, that they associate themselves with shame and fear, and cover the fault with the shadow of decency: And therefore also, pride hath by degrees chosen sloath for its companion, the coupling whereof hath soon bred ignorance: So that indeed, a Doctor being called unto the outward deformities of an Erisipelas, hath been ignorant of the kind and name of that affect; the which, when he had warily understood by the Chyrurgion, he late at night rowls over some books, that on the morning following, he may declaim many things concerning the affect: therefore, he bids a vein to be opened; he commands Whey, with Rose-Vinegar, or Soap, to be applied, for mitigating of the burning heats, and describeth a potion against the day following, for the drawing out of Choler. The Chyrurgion smiles as oft as the event answereth not his promises; and the Doctor, by degrees, shifting of external diseases (because he is ignorant thereof) as being content with his Super-eminent Title, that he had read most things in Chyrurgical writings, and could declaim most exceeding ample things among the common people, the Chyrurgion conniving thereat. He in the mean time, who without the advice of the Physician, takes to him his own Disciples, who can sometimes pull out a Tooth, who have known how to open a Vein, to spread *Basilicon* and *Diapalma*, and have learned in three years time to bind up a wound, they are reckoned the Free-masters of Chyrurgery, against the will of the Schools. But the Doctors have too late learned the Fable of him who had endowed a Serpent, frozen with cold, with his own bosom, and being pierced thorow by the same, miserably perished: And that thing at this day is so far extended, that Chyrurgions henceforward, have their own Doctors or Teachers, Professors, and Writers, in their Mother Tongue, amongst themselves. Then I say the Schools, and that too late re-considered; so that they, who at first blushed to repose a broken or displaced bone, and afterwards knew not how to do it, are now glad to poure back the Urine, and to stir stinking dung with a stick, that they may divine their humours to have been chased thither: And that unless they shall do that, verily they know, that as idle at home, they ought to grow mouldy beside their books: For in the mean time, the ignorance of Chyrurgery is encreased among Physicians. Truly, God hath every where punished pride, by ignorance, or madness.

Galen indeed wrote books of the *Therapeutick* or practical part of healing, which they interpret to be a method of healing: But who is he that knows not that *Therapeuta* sounds as an household servant? and so, that they should serve Nature and the sick, with the humble Title of Family-service: and we will glory in the Lord, who taking on him the nature of a servant, would that his own Physicians, should in this humble vocation, be made partakers of the most Noble Science of the whole Universe. And indeed I at sometime asked a Canonical man, why he would not sing together with the rest at the hours of singing, who from their Institution were the Singers of Divine Praises, the imitators of Angels, but not the Heads or Directors of Ecclesiastical Hierarchy? He answered, that would be an unbecoming thing for great Canonists to sing; that they had their lesser Beneficiated ones, and Chaplains: For the one, through a possession of a larger alms, denieth unto God his praises, as a thing disgraceful unto him; but the other accounts, that it would be uncomely for him to handle, cleanse, and bind up the torn Members.

bers of Christ. But I am assured, that within a few transitory daies, the Lord will say; Unless ye become as one of these little ones, I know not you Lamp-bearers without Oyl. Wherefore, I exhort you my Brethren, take away gain, and in the room thereof drink in charity; and ye shall feel, that every good work, which now seems to be base unto you, is not only laudable, honest, and Noble; but also, that it sanctifies and ennobles its Operater. Was not the great High-Priest of the Jews a Prince, a Butcher of Herds, a Killer of a Flock of Cattel, having bloody hands? But it is far more decent to bind up the Ulcers of the poor, than it was in times past to offer Sacrifices: For no good work in charity, shall ever be able to detract any thing from the Reputation. Gain therefore and Pride, were introduced by Satan.

But thou wilt say, the Labourer is worthy of his reward: If thou art a Labourer, let it not therefore shame thee of thy work: The wise man saith, *a Physitian shall receive a gift* (not a stipend or reward) *from a King*, not from a poor man: Therefore, if the intention of the Operater be pure, God shall provide according to his promise, who deceiveth none, promising an hundred-fold in this time, and the life of another. Wherefore I will describe by the way, an history of my own life, and the magnificences or sumptuous provisions of the Lord: imitate ye the same, if happily any good thing shall therein offer it self.

Truly, I was a Glutton of Books; I had collected all remarkable things into common places, so as that few exceeded me in diligence, but most in judgement. In the seventeenth year of my youth, I read Lectures of Chyrurgery before the Students, in the Colledge of the Physitians of *Lovain*, being appointed thereto by the Professors, *Thomas Fienus*, *Gerardus de Villeers*, and *Stornius*: Alas, I presumed to teach those things which I my self was ignorant of: I fitted together *Holerius*, *Tagautius*, *Guido*, *Vigo*, *Agineta*, and the whole Troop of *Arabians*; the which surely all together, understood not the perfection of Chyrurgery. Afterwards I desisted, having admired at my own rashnesses and inconsideratenesses, that I should presume, only by the reading of books, to teach those things which are not well learned but by sight, and the handling of the hands, by long use, and a sharp judgement: For an unconsiderate presumption blew me up, because I had been voluntarily by them chosen hereunto, and had my Professors, both my Auditors, and the Censurers of my readings: For I trusted to writings, as it happens to children reading from *Baiardus* and *Malegigius*. At length, being amazed with my self, I certainly found, that the event answered not the Doctrine, and that Professors gave me not more light in practising, than the writings of the Antients. In the mean time, it often came into my mind, what the Schools thunder forth out of *Avicenn*; to wit, that confidence on the Physitian is of greater weight to the sick, than the Physitian is with all his instruments: I therefore suspected, that it was a feeble succour of the Physitian, before which, an imaginary aid of confidence should be preferred: For if any one being glad or joyful, be cured by laughter; at leastwise, let the medicine be ridiculous, where the Physitian shall cure the sick party by laughing and confiding; for that is not the medicine which the Almighty hath created from the earth. Then also, that Maxim of the Schools appeared ridiculous, affirming, *that the capital botokening of curing, is drawn from things helpful and hurtful*; because that Maxim ordinarily presupposeth, that uncertain, and hurtful medicines are wont for the most part to be sent afore: Helpful ones also, if any shall be given, that they are administered by chance, and without knowledge: which things surely do define medicine, against the will of the Schools, to be a conjectural Art, and that the knowledges and cures of diseases, do begin *a posteriori* or from the effect, from errors, from the tryal and conjecture of that which is uncertain; yea, that that which should afterwards be searched out, should be alike uncertain. The Poet hath deservedly cursed that medicinal Maxim.

*Careat successibus opto,
Quisquis ab eventu, facta notanda putat.*

*I wish that he, who e're he be, may want successes rare,
Who from th' event, doth straightway think, deeds to be noted are.*

I therefore grieved that I had learned that Art; and being angry with my self, grieved, who was Noble, that against the will of my Mother, and my Kindred on the Fathers side being ignorant thereof, I as the first in our Family, had dedicated my self to medicine: I long bewailed the sin of disobedience, and it grieved me of the years and pains bestowed in

in a choise profession : And I oft-times humbly intreated the Lord with a sorrowful heart that he would vouchsafe to lead me unto a calling, not whither I was carried of my own free accord ; but wherein I might well please him most : And I made a vow, that I would follow and obey him to the utmost of my power, whithersoever he should call me.

Then first, as having been fed with the forbidden fruit, I acknowledged my own nakednesse : Because I found neither truth, nor knowledge in my suppositional doctrine, supposing it especially, to be a cruel thing to heap up moneys by others miseries : Also, that it was an unseemly thing, to translate an art founded in charity, and bestowed under the condition of exercising mercy, into gain ; since the Noblenesse of charity is estranged by a stipend, which wants a price out of it self, because it is greater than all price : Wherefore, I presently entitled my inheritance on my sister a widow, and transferred it by a gift among the living ; because she could scarce conveniently want it.

I therefore being a young man, altogether unprofitable in all things, an unthrifty man, and who had rashly applyed my self to studies, commended my self to God, with an intention of going far from home, of forsaking medicine, and of never returning into my Country : Because I clearly then beheld my own innermost parts ; I discovered, and divorced the vanities of my former presumption, and literal Learning ; I therefore proceed on as uncertain, unto strangers, under hope, that the Lord would clementiously direct my course unto the end of his own good pleasure : But by how much the more I detested medicine, and cast it far from me as a juggling deciet, indeed, by so much the greater occasion of healing invaded me.

For an Idiot associated himself with me, who had known at least, the manual instruments of the art of the fire : I presently as soon as I beheld the inward part of some bodies, by the fire, perceived the seperations of many bodies, then not yet delivered in books, and at this day, some being unknown : Afterwards, an earnest desire of knowing and operating, daily increased in me : For not much above two years after, I had gotten such household-stuffe to my self, whereby I was, though absent, in great esteem among the sick ; also with *Ernestus Bavarus* the Electour of *Collen*, and he called me unto himself for help : But then it as yet more shamed me of my late, and learned ignorance : Wherefore I presently resigned up all books, and I perceived my self more to profit by the fire, in conceptions attained by praying, than in any kind of books, which sing always the same Cuckows note : And then I clearly knew that I had vitiated the passage of true Phylosophy : Obstacles and difficulties of obscurities on every side appeared ; the which, not labour, not time, not watching, lastly, not the lavishments of moneys could from any worthinesse disperse : but the one only and meer goodnesse of God alone. For neither did carnal lust, nor drinking bouts withdraw even one only houre from me ; but continual paines, and watching were the thieves of my time : For I willingly cured the poor, and those of a mean fortune, being more stirred up by humane compassion, and a moral affection of bestowing, than from a pure and universal charity or dear love reflexed on the Fountain of Life.

For it happened, that a *Consul* or *Senatour* being at sometime willingly about to make use of my endeavour, I denied to give it him presentially, as being unwilling to forsake many that were poorer, least I should be accounted to have neglected many for one : Notwithstanding, God from the free grace of his own good pleasure, turned this pride into good : For it shamed me to receive moneys, but of the richer sort : So that a Confessor constrained me to admit of the mony of a certain man that offered it, least by doing otherwise, I should bar up the dores against those, who being fore-stalled with shame, would not dare to aske further succours from my hands : For he said, *The gifts which thou refusest, give to him that is in need : and the which, if thou shalt not receive, thou by thy pride, withdrawest from the poor that which was to be his own.* I also gave willingly, the medicines prepared by me : but because I felt the greater joy while I was called by a Primate or rich man, I being angry with my self, and confounded, resisted long, and bestowed very much pains, that I might pluck up the growing branch of covetousnesse bred in me : Therefore I every where searcht out more of arrogancy and haughtinesse in my self, than of a Godly affection.

Finally, God cut of the means from me, as well in the Church as among civil Potentates ; and so also, ample fortunes seemed to be promised me by *Rodolph* the Emperour, but I had incurred the danger of my foul : In exchange whereof, he gave me a godly and Noble wife, with whom I withdrew my self to *Vilvord* ; for seven years space, I offered up my self to the art of the fire, and succoured the calamities of the poor. I found,

and

and indeed I found for certainty, that none should be forsaken of God, who with a pious affection, and firme faith, performs the office of Physitian: For although I was the silliest of all, I seeingly discerned, that God is Charity it self towards the miserable, and therefore that from his own effluxing goodnesse of charity, he alwayes bore a care over me: For the inheritances of my wife were increased, and ample patrimonies of my family beset me: for although I was subdued in suites of law, by the malice of men; yet I became a conquerer by some revivals; so as that the mercies of God openly appeared toward an unworthy person.

And moreover, he pressed down those that excelled in might, who persecuted me unto disgrace, and hidden death, under the cloak of piety: And the darts were reflected on their own strikers; so that now it more shameth, than repenteth them of their manifested crimes.

In the mean time, I desist not to cure some ten thousands of sick persons every year, by my remedies, neither are my medicines therefore diminished. I have learned therefore, that the treasure of wisdom is not to be exhausted, and I daily experience my yesterdays ignorance to be to day illustrated. But in returning from whence I have digressed: I find that they have not yet been able to discern what defects respect a Physitian, and what a Chyrurgion: Which things if I may determine of, I declare, that onely things susceped or undergone do touch at Chyrurgery: The which in a section concerning a new rise of healing, I have sufficiently explained: But things susceped, are a wound made by piercing, a cut or incision made by a fall, biting, bruise, burning or scorching, or congealing: Likewise, every swelling proceeding from a fall, stroak, &c. Also a rent, pulling asunder, burstnesse, breaking of a bone, and displacing thereof: As also, contagions externally drawn, being those of scabbednesse, the kind of *Anthones* fire called *Herpes*, &c. and no more: But unto Physitians, besides the internal defects of things retained, it belongs to cure any Ulcers, Apostemes, and whatsoever external affects do proceed from an internal Beginning, such as are the Cancer, Wolf, Leprousy, Gout, the disease Paneritium, the Sciatica, &c. But at this day, there is the more mild brawling between both Professions, because most Physitians are ignorant of a method, medicine, and succours, no otherwise than as Chyrurgions are: And therefore although they joyn hands, and so exhaust the purses of the sick party; yet at length they hasten to the bound of despair.

And in the proposed question concerning the Plague, they are unanimous enough: For the Physitian refuseth the Plague to be of the diseases placed under him, because it beares before it a Carbuncle, Kernelly Glandules, Sores about the groyne called Bubo's, an Escharre, bubbly Tumours, and Tokens: And at leastwise, he condescendeth with the Chyrurgion, because he promiseth that he will scrape together out of renowned and standard-defending Authours, any the best Antidotes, if not the curative medicines of external affects; at least, preservatives against the cruel poyson: Yea if the Triacle of *Galen* doth not suffice, which according to *Andromachus*, containeth only 66. Simples, (that is the last part of the name of Antichrist) he promiseth to his herbarists, that he will super-add very many more, which are sufficient for the putting of the Plague to flight: and that if they are not prevalent in a sufficient power or faculty, they may at leastwise, be able to strive with the Plague, in multitude, by their number: But if the Doctour shall be hired from the City, with a stipend, least he should hurt or be wanting to his other sick patients, by causing a fear (thus he over-covers his own fear with anothers dread) he ingeniously promiseth, that he will shew by his pen, that the affairs of the sick are cordial unto him: So that, he will also frame a book out of the most Famous Authors on every side, which he promiseth to dedicate to community, indeed under the hope of repaying a reward of his vain-spent labour, unto the writer: For in that treatise, he promiseth, that he will so distinguish of diet, exercises to be performed, avoyded, and of meanes to be curiously examined, besides remedies and preservatives, out of all Authours, that the very Plague it self, shall upon the sight of that book, of necessity become diseasy.

In the next place, the Chyrurgion saith, that the Plague, as it is joyned with a Fever, stands not to be ruled by his will or judgment: But however successfully the matter shall sometimes prove unto him; at least wise, that for six weekes after, he should be profitable to none, with his sissers, file, knife, or rasour or launcer. What therefore shall he that is suddenly taken with the Plague, do, being left destitute by both forsakers? Or what will the Magistrate do, being deluded by his own stipendiaries? Because they are they which respect nothing but gain, the one only scope of their whole life.

The

The Physician therefore will dismiss the sick unto the non-feared Pest-houses, wherein there is as unlawfull a pleasure for a Physician to kill, as for a tormentor, and souldier. The Chyrurgion answers, *That there is a Mate known unto him, who is without fear, after that he hath notably drunk; who although he hath not known how to open a vein, (for this is esteemed the top among them) neither is worthy of his family-service; yet he hath oftentimes brought Simples out of a wood, or mountaines, and therefore that he is skillfull in some Simple, which whether it be an Herb, Shrub, or tree, or living Creature, he hath hitherto refused to declare; Yet he undoubtedly affirmeth, that it prevailes against the Plague, and he willingly perswadeth him to commit the buisnesse of the infected unto him.*

Matter Doctour skipping for joy consenteth, and praiseth the subtile invention of the Barber, and his care for the Common-wealth: And so that companion being called unto them, a Lixivial medicine for an Elchare, Basilicon oyntment, and Diachylon gummed is given unto him, and also a magistral preservative confection described by the Physician: Wherewith he being now furnished, becomes a stipendiary of the City, and the life of the common-people in misery, and the sail-yard of the Common-wealth is committed unto him: yet under this condition, that if he suffer himself to be governed by Tenders, and under-Sisters, as super-intendents, who by a long possession, rage on the sick, he is to receive a yearly reward. Surely miserable are the sick, more miserable the Magistrate, and most exceeding miserable the Doctour, unto whom the Magistrate hath committed his sheep, which they deliver to wolves: Because in this respect, man is truly a wolf to the poor, and infected man. But the strict judge, will at sometime, require at their hands, the lives, souls, and forsaken orphans.

For what would a King do, if a cowardly Captaine shall wipe away much money from himself and the people, and muster a great band of country-men in his entowling book, but shall betake himself, with his Ensign-bearer, into a most fenced Tower or Castle: but shall write unto the Drummer, and some women-sellers of provision, that they cheerfully assault the Enemy with those fresh-water Souldiers? For will not the King require of his Captains, the Souldier that was rashly slain? And the town destroyed by the Enemy? Have regard therefore, ye Senatours, and Physicians, what cruel thing doth not hang over your heads? Because nothing is more certain than death and judgment. For I have written these things from a compassion on you, and the sick: I divine of you, let God be favourable unto me! At leastwise the Magistrate hath not hitherto known, of what kind the Plague should be.

CHAP. 2.

The Pest or Plague, an Infant.

A *Rtaxerxes*, by an Epistle, commanded *Petus*, that he should come unto him, to cure a disease (as yet without a name) which killed his Citizens and Souldiers; for that, by gifts recieved, he was obliged hereunto. *Petus* answered him after the manner of Physicians at this day: *That natural succours do not free from a popular slaughter: For those diseases, which are made by nature, those nature judging of, bealeth. But Hippocrates cureth a walady from a popular destruction: Because this man is endow'd with a divine nature, and hath carried up medicine from a low estate, unto great achievements.*

Hippocrates therefore is a divine man, the ninth indeed from King Chrysamides, but the eighteenth from *Æsculapius*; but the twentieth from Jupiter: Being indeed of his mother *Praxithia*, of the family of the *Heraclides*: Wherefore, from both seedes, he hath his original from the Gods: He was initiated or entered as a young beginner in medicinal affairs by his great grandfathers, so far as it is to be believed, that these knew: But himself hath taught himself, having made use of a divine nature, the whole art: And in the industry of his minde, he hath as far exceeded his progenitours, as he hath also exceeded them in the excellency of art: But he takes away, not only the kind of bestial, but also of brutishly fierce and wild diseases, through a great part of the land, and sea, dispersing the succours of *Æsculapius* (even as *Triptolemus*, the seeds of *Ceres*): Therefore hath he most justly obtained divine honours, in many places of the earth, and is made worthy by the Athenians, of the same gifts or presents with *Hercules* and *Æsculapius*: Send thou for this man, and command, as much Gold as he shall be willing to receive, to be given unto him: For

Y y y y y

this

this man hath not known one only manner of curing this disease: This man is the Father, the preserver of health, and the curer of griefs: In summe; this man is the Prince of divine knowledge.

Artaxerxes therefore, writes unto Hystanes the Lieutenant of Hellepont. Let Hippocrates the Glory of Coos, who drew his original from Æsculapius, come unto me: and give him as much Gold as he will have, and other things in abundance, sparing no riches: For he shall be made equal to the Peers of Persia: For it is not an easie thing to find men that excel in counsaile.

Moreover, Hystanes writes thus unto Hippocrates: The great King Artaxerxes hath need of thee: Commanding Gold, Silver, and whatsoever thou wilt have to be given unto thee; that thou shouldst be made equall unto the Nobles of Persia: Thou therefore, come quickly.

Hippocrates the Physitian, unto Hystanes the Lieutenant of Hellepont, joy.

Send thou back to the King, what I say; That we enjoy food, rayment, house, and all sufficient wealth for life: But that it is not lawfull for me to make use of the riches of the Persians; neither to free Barbarians from diseases, that are enemies to the Greeks. Farewel.

Hippocrates unto Demetrius, health.

The King of the Persians hath sent for me; as not knowing that with me, there is a greater respect of wisdom, than of Gold. Farewel.

To the King of Kings, my great Lord Artaxerxes: Hystanes Lieutenant, joy. The Epistle which thou sentest unto Hippocrates of Coos, who sprang from Æsculapius, I sent a way: but I received an answer from him, which I transmit unto thee, with the bearer thereof Gymnashes, Diemyches. Farewel. Great Artaxerxes, King of Kings, saith these words unto the Co-ans: Render ye Hippocrates to my messengers, who is indued with evil manners, wantonizing over me and the Persians: But if not, ye shall know that ye shall pay the punishment of the offence: For I will convert your City, being laid wast and drawn into diverse parts of the Island, into the sea: that for the future none can know, whether there were an Island, or the City Cos in this place.

The Answer of the men of Coos.

It hath seemed good unto the people, to answer the messengers of Artaxerxes: The Co-ans will do nothing unworthy of Merops, nor of Hercules, nor of Æsculapius: All the Cities will not yield up Hippocrates, although they were to dye the worst of deaths: The Earth, and Water which Darius and Xerxes required of our Fathers, the people gave not, since they saw those very Kings themselves, to be impotent mortals, as other men. They now answer the same thing: Depart ye from the Co-ans and return this message, that the Gods themselves will not be negligent of us; Because they deliver not Hippocrates into your hands.

I have thus described these things at large, whereby the truth of the fame of Hippocrates may be manifest, and that he had cured the Plague among the people throughout Greece: For indeed, that disease being as yet an Embryo, scarce known, scarce named, was now perfectly cured: but now, it being sufficiently and too well known, is left unto decievers of the lowest condition: Charity hath grown cold; therefore the light of knowledge, and understanding hath been snatched away from us, and the certainty of curing hath been buried with Hippocrates. Although a great volume be born about in his name: yet he suppressed this safety or assurance of curing (God so permitting it) for fear

fear of the Barbarians; or from a zeal of vanity to be observed, because he arose from the stock of Deasters or Starry Gods: or because through the successive interchange of days, his own monuments perished, suppositional ones being left: However it is, by the permission of God, the afore said amplenesse of knowledge, and safety of curing the Plague hath hitherto vanished.

I have read perhaps, an hundred Authours concerning the Pest or Plague, indeed all of them transcribers, writing a far of, and being unexperienced and conjectural ones, through a fear of death: That at leastwise is known, that in the dayes of *Hippocrates* the best remedies of diseases were not as yet made known: For then cures were instituted only by Simples, and those crude ones, the preparations of them being not yet devised.

But *Galen* his Junieur by more than five ages, endeavoured to write commentaries on *Hippocrates*, and he with drew from him at pleasure: For why, he had never seen *Argent vive*, never Rose water, or *Aqua vite*. And although the age of *Hippocrates* was homely; yet healings were obedient unto him, which do no wise obey *Galen*, nor his followers at this day.

Hippocrates had lesse of prattle, but more of candour, science, and heavenly light: so that with homelinese, ages have seemed to put of purity, and the gift of God: Wherefore our ages have been fruitful in most perverse manners, and wits: It hath therefore pleased God, that a true and exact curing, and prevention of the Plague, hath soundly slept together with *Hippocrates*: At leastwise, nothing is read among the *Jews* concerning a popular or general Plague among the people, from the age of *Noah* unto the offence of *David*: But among the *Persians*, and *Greeks*, besides the consumption mentioned to have been in the age of *Hippocrates*, the enemy of mankind, and Prince of this world, hath caused some Plagues to rage, by the permission of God, which Satan commanded to be expiated by sacrifices done unto himself: Perhaps, because that thing was not granted unto him, as to the Prince of darknesse, so much, as because he had the foreknowledge of a future Plague, and together also, of the term of its appeasment: Whence he violently, fabulously and deceitfully challenged the rise, decay, and power of appeasing thereof unto himself. A Plague is read to have seldom been among the *Romans*: And but a few ages ago, the memory of the Plague was almost worn out: At length, it returned for ages, and raged for seventy years; and soon after it destroyed for fifty years; so that the year of *Jubile* was made cloudy, and terrible. Now, there is a third years Plague at *Constantinople*: The *Turks* are not wont to provide for themselves against the pestilent contagion: And therefore they scoff at the Christians, as resisters of the ordination of God, and as those that decline the Plague, for the most part with a vain endeavour: That the manner of divine revenge, is to be born, which happens of necessity, unto every one appointed thereunto. In *Egypt*, the Plague varies every seven year: It for the most part, endures unto a third year, after this manner, as Prince *Radzuil* the *Polonian* witnesseth. On the first year it lightly begins, when the Sun enters into *Libra*, and it rageth chiefly in *December*, even unto the month called *March*: At which time, the heats are milder: but when they have grown strong; when as in the year following, the Sun enters into *Leo*, the Plague presently ceaseth; and indeed so, that if any one shall have a Pestilential Apotem within, and shall survive unto the afore said hour of the afore said celestial sign, he escaps all danger: Even as colds with us, so here, heats chase away the Plague, and for two months time they live securely: But after that the Sun hath entred into *Libra*, the Plague again begins by degrees, and continues until the entrance of the Sun into *Leo*: on the third year, it keeps the same fashion, but that it slakens somewhat more from its bitterness: Afterward, if a contagion shall not be brought on the people from elsewhere, the four following years are free from the Plague: sometimes also, a longer truce is made: But the malady for the most part returns in the space of seven years. Their harvest begins about the end of [the first month called] *March*: Before the last days of [the second month called] *April*, it is finished: For the southern windes blow throughout [the third month called] *May*, which by burning, would reduce their fruits unto nothing. That Prince having been there thus perfectly instructed, wrote these things, and believing all: whereunto, I shall give satisfaction in its own place: At leastwise, the holy Scripture makes no mention, that these things happened unto *Egypt* in times past; although the Sun and Heaven are now rowled about in the same circle, as in times past: For my speech is the memory of my Parents, concerning the Plague, as of a most rare monster: It hath of late flourished among us for fifteen years: Now it ceaseth: Houses were then built up at *Bruxels*, for the

infected poor, and the walls themselves were broken at the North-ditch; of which houses, our Country could long be without: But I lay the fault upon us; it was a command of Charity; *draw thy Neighbours Ox or Ass out of the mire, bring him to his Master, neither shalt thou pass by the way, doing otherwise.* But now the Cattel of our Neighbour, is not only not freed, but we ourselves press them down; yea, we forsake and flee from our Brother (the Temple of God) in his greatest necessities, and mortal diseases, and stop our ears at his lamentations: every one, like the Priest and Levite, passing by, excuseth himself from the work of charity, as though that to do a good work, were not belonging to his profession, and as if the Text were a liar; *Whatsoever thou shalt do unto the least of these, I will account it as done unto myself.* Its no wonder therefore, that in these ulcerous rubbishes of our daies, God sorely threatens the destruction of a most perverse people; and that their Cities shall be ploughed as a field: For I have oft-times been affrighted within my self, at that eminent fore-going sign of the destruction of the Universe to come; *There shall be Plagues:* For I from thence despaired, as that none was to come after Hippocrates, who should any longer cure a popular Plague: But from elsewhere I hoped, that as what we wish for, we easily hope for, and in hoping, do also believe; so also, that we might despair of what we are very much afraid. I therefore believed and hoped, that this safety of curing the Plague should hereafter be discovered, and that every succour before the last Tragedy of the world, would again be hidden: at leastwise, I suppose, that there will be other far more horrible Plagues than ever heretofore, and against which, all Antidotes will be vain: For truly, our Plague at this day, doth not affect brut beasts: But in the last dreggishness of daies, they shall destroy wild beasts also; yea, fishes, and trees; and there shall be Plagues, but not an ordinary Plague; otherwise, this should be an uncertain sign of the future destruction: For there shall be Plagues from the hand of God, from the pouring out of the Vials, as the Revelation hath it: But against those Plagues there is not to be a Buckler in Nature. I promised therefore unto my self, before I attempted to write these things, that the Plague that was curable, even unto that face of times, and a true remedy thereof, was to be fetched out of the Grave of Hippocrates, or rather from above, from the Father of Lights. I will declare what I have learned, for the profit of Posterity.

CHAP. III.

The Heaven is free from, as also innocent of our Contagion or Infection:

NOr the least comfort hath appeared unto the Soul that is earnestly desirous of knowledge, or unto the miserable and forsaken sick, from the writings of the Antients. First of all, it is of Faith, that the Stars are for signs, times or seasons, daies and years; nor that man can any way alienate the offices of the Stars, or decline them unto other scopes: That the Heavens are the works of the Lords hands; that God created not Death: and therefore, that neither doth the Heaven contain Death, a disease, poyson, discords, corruptions, or the effective cause of these: For truly, they are ordained, not for the cause, but for the signs of future things; and only for the changing of seasons, or Mercors, and for the succession of daies and years; The office therefore of the Heavens, is not to generate evils, to cause poysons, to disperse, or influx them, to sow wars, and to stir up deaths: Because the heaven cannot exceed the bounds of its own appointment: the heavens declare the glory of God, for whose honour, and the uses of ungrateful humanity, it was created: And therefore, it rather contains in it, life, light, joy, peace, and health, with an orderly and continued motion: no curse is read to have been communicated to the heaven after the transgression of Adam, nor execration to be infused into it, as neither a spot to have been sprinkled thereon. The earth indeed brings forth thistles and thorns; because under the Moon is the Copy-hold of the Devil and Death (because of sinners) the Empire of discords, and interchanges: The earth hath become a Step-mother unto us, she is therefore the vale of miseries, being great with-child of the corruption and fardle of sinners; because it hath pleased God, that there should be no other way unto rest, but by tribulations: yea, it behoved Christ to suffer, and so to enter into glory; not indeed anothers, but his own, because he was willing to take on

on him the form of a servant. I believe the Word of God, but in no wise the vanities of the Sooth-sayers of Heaven; and I judge, that they who write, that the Plague doth arise from the heaven, do stumble, as being hitherto deceived with the errors of the Gentiles.

The Heavens declare the glory of God, and the Firmament sheweth the handy-works of the Lord: The Heavens therefore, shew a sweet, or bitter thing to come, but they do not cause that sweet, or bitter: yea, neither is it lawful for us to call bitter things evils; for God hath directed all things to a good end: Therefore the heaven declares future things unto us, but doth not cause them; and the stars are only unto us for the signs of things to come; and therefore there shall be signs in the Sun, Moon, and Stars. The Stars also cause the successive alterations of seasons in the ayr, waters, and earth, only by a native Blas: From whence the changes and ripenesses, as well in fruits, as in the body of man, especially in a sick one, do consequently depend.

I understand also, that the stars are in this respect for times or seasons unto us, by their motive and alterative Blas: For neither therefore are the Heavens Sorcerers, or the Co-operators of poysons, the incensers of wars, &c. I knowingly consider them to be altogether as the alterers of successive interchanges in Elementary qualities, as to the interchangeable courses of Stations: Wherefore it happens, that the sick are diversly altered in the promotion and maturity of seeds conceived in them; because our vital faculties do stir up every their own Blas, according to the rule or square of the most general motion of the stars; not indeed, as of violent leaders; but of foregoing, or accompanying ones. For the Book of the *Revelation* doth not attribute even any the least punishing power unto the Heavens; but the same to be distributed by God among the Angels: and the which therefore, are called smiting, and ministering spirits, performing the commands of the Judge: Therefore, I shall not easily believe, that the Plague owes its original unto the importunate or unseasonable changes of times; the which also, *Endoxus*, according to *Fernellius*, perceived.

And I cannot be induced by any reason to believe, that the Heavens do give growth, form, figure, virtues, or any thing else, which proceedeth from the Being of seeds: For the Herb was potent in a flourishing seed, even before the stars were born; so that although there should be no stars, yet every seed, by the power of the Word, is of it self naturally for producing of its own constituted body, and against the will of the stars, and stations of the year, yea, and of climates: many seeds and foreign fruits are produced by Art: Wherefore, the Epidemics of *Hippocrates*, illustrated with the Commentary of *Galen*, do also contain very many things, unworthy the name of the Author; not only, because it attributes diseases to the stations or seasons of the year, and not every one to their own seeds, and divers infirmities to one root (that is, unto the first qualities of the ayr) and so coupleth divers effects with unjust causes; but because they contain very many absurdities of trifles.

For I am wont in this thing, to compare Judiciary Astrologers unto Empericks, who having gotten an ointment, powder, or any other medicine, extoll the same to be prevalent, well nigh for all diseases; and also, for many other: So, many of these bring not content with the shewing or betokening message of the Stars, constrain them to be the workmen, Deafters, and absolute Patrons of all fortune and misfortune, to be conscious or witness-bearers, and the workers of life and death to come: Lastly, to be the Counsellors and Judges of thoughts, and questions asked. If therefore, they do not constrain death, wars, poysons, nor the Plague; verily, neither shall they be able to rain down such scourges upon us, seeing they cannot give those things which they have not, do not contain, do not cause, nor generate: For a messenger, the Preacher of Wars, is not the General, or cause of these. For if *Trigantius* the Jesuite tell truth, the Plague is unaccustomed unto the most wide, and whole Empire of the *Chinois*, and never there seen; over which, notwithstanding, the same *Saturn*, and the same *Mars*, bears rule, and that alike powerfully as over us.

Again, if in some Lands the Plague rageth at a certain term of time, and returns at fore-known stations, wherein notwithstanding, the Plague in times past was a very great stranger; surely it should follow, either that those Provinces do not lay under the influences of the Stars, or not under the same influences as in times past; or that those Plagues are adulterous ones, or at leastwise (as I deem) that they do not proceed from the heaven; to wit, since there are no consultations of Stars in the same place, which do yearly observe set daies of their assemblies: For what if the plague in one City, destroy the greatest part of mortals; truly all providence of the Magistrate shall be in vain, if the Neighbouring

bouring places that are situated under the same Meridian or corner of the heaven, cannot be preserved untouched.

And seeing the influx, and in-beaming of the stars, is most universal; how mad soever others may be, yet it is not to be believed, that plagues can have an influence from the stars of heaven, unto designed places, Cities, and Villages: For if the Plague it self should be a pestilent influx of the stars, or a Gas sent down from above unto us, or a meer naked quality descending through the ayr, which comes unto us without that body; it shall also be either conceived in the stars, or generated in the ayr Neighbouring on us.

If the first of these, it should of necessity be, that all the corners of the world should be infected at once, unless we suppose a Pipe or Trunk to be directed in the ayr, and throw the ayr, from the heaven even unto us, and that an unmoved one; by which also, and not otherwise, the pestiferous ayr bringing down the smoakiness and defilements of the stars, is conveyed unto us: For since the distance of the stars from the earth, is of many thousands of Diameters of the earth; it is not to be thought, that any smoakiness of a star can reach safe unto this Center (and lesse unto some Province thereof) but that it can infect the whole compass of the Earth and Sea, with a universal gore at once, it supplying the space and room of one the least Center or Point. Therefore, if the Earth be like unto the least point, hitherto have those things respect, which I have elsewhere spoken concerning the Region of the ayr, through which, neither winds, nor dew, or rain, do ever run down, nor Meteors do play their Tragedies: And much less doth any thing flow down perpendicularly out of the depth of the heaven: or if it should rain down; some Decades or ten-fold numbers of the age of *Nestor*, would not be sufficient before that it could come as a stranger unto us. But if the stars do at least dismisse from them a meer and naked quality, that quality shall even by so great an interval of place and entertainments, degenerate and fail divers times, and through the journeying of some yeares, and so, before it can come unto us, it shall have nothing of its former likeness; neither could such a quality coming unto us from far, infect a certain place, unless it be brought by an Angel, as it were in a box: but if by an Angel, now the natural question ceaseth, and we vainly make the heavens to be the bringers of the Plague, and Sorcerers, if an Angel himself be the Plague-carrier; who otherwise can bring far more readily the pestilent poyson nigh the earth, or into us, than that he should bring that with him, from the pure and guiltlesse heavens.

In the next place, a pestiferous quality sliding down from heaven, if it shall not descend at once in the enclosed air, it shall either pass from subject into subject (which the *Peripateticks* and modern Schools refuse) or through a thousand shapes of it self, and those so often degenerated, shall come down from its original unto us, as wholly a stranger; and so the poyson of the heavens shall be frustrated. But if it be supposed to be generated in the Clouds nigh the earth; therefore the heaven being free and guiltlesse, is falsely accused: For truly, I have shewn elsewhere, that the heavens do operate only by a motive, local Blas, and an alterative one, of heat and cold, but in no wise by poysons: because they are those things which are only formal properties of sublunary bodies, and the fermental ones of some seed. I grant indeed willingly, that a fiery weapon is now and then seen, a fiery weapon to have fallen out of the ayr, being darted unto some certain place; and that the plague hath sometimes followed thereupon: But that prodigy, in the first place, slideth not out of the deep bosom of the heaven, but out of a more nigh Cloud: Perhaps Satan the companion of Thunder, lets fly such a weapon, where he knows the plague to be sorely threatned (from whence, he of old, snatcht the honours of God unto himself) but that weapon is not therefore the cause of the plague: otherwise surely, at every plague a weapon should from a like necessity, be darted forth; especially because it is the property of fire, to consume the plague, and poysons, but not to generate them: Therefore fire doth never naturally, signifie the plague, whose destruction it containeth: and therefore, such a fiery weapon is a most rare monstrous sign; sent down by spirits for terrour unto him, who shall rest back that weapon for the amendment of his life: and truly, it is impertinent to our purpose, and an exceeding frivolous thing, if from thence we note the heaven to be the bringer of the plague: For any monstrous signs are uncertain, and unfit for the foundation of medicine. But if an age or length of time, should thrust this pestilent ware into our bosome (for so it hath been believed hitherto, and they have badly deceived our Gentile Schools with an Epidemical name) to what end are there so many writers? or what means have been hitherto devised against those importunate influences of the stars? For who hath hitherto hindred the marrow from

from increasing in the bones, after the manner of the Menstrues? therefore they have falsely accused the heaven: Let it seem sufficient for the Schools, to have made the heaven the Author of the plague, and to have buried their own knowledge under the silence of despair, only from the persuasion of ignorance, and terrour of fear: Therefore the accusing of the heaven doth every where involve a manifest and necessary ignorance. But at length, after that they have contracted all the strength of their Studies, they persuade, that places are to be avoided, wherein the Plague-stroaks are vigorous; that meats full of good juice, must be used; that a good fire must be made, and that any kind of filths must be avoided; and that Triacle must often be used, whereinto, when enough simples have not yet been cast, every one may heapingly add new Centuries or Hundreds at pleasure, thereunto, and so, that is reckoned the most excellent Antidote, which containeth the collected heap of a thousand simples: and they hope, that one of a thousand may perhaps help, at leastwise, that it will not hurt: For those are Magistral Antidotes or medicines against the poyson; so that if in the mean time, the matter shall the less luckily succeed according to desire, at leastwise, he who hath compiled so many the most select simples together, and those commended by Renowned Authors, is free from blame: they being badly mindful of their own lyes, prescribe also grateful suffumigations of vinegar, and Odours of Spices; as if such feeble remedies could prevail against their own principles; that is, against poysons diffused from the heaven, throughout the whole air: For if by reason of those odours, either the beard, or nail of the hand; or lastly, the marrow ceaseth to grow, it might infuse some confidence of hope, that the pestilent seed might be overcome by the wan remedy. Therefore, if there were any causative reason of the plague in the heavens, that by a stronger right, should belong unto man over the heavens, if a wise man shall have dominion over the stars, but not the stars over a wise man: For a wise man is able in some respects, to change the significations of the stars, although not the motion of the stars. But that thing is as greatly impertinent in this place, as is the false accusation of the heavens: For truly, if the stars should causatively work their own effect on us; verily, a wise man, might be able to mitigate it, and Physicians do, by their accusing of the heaven, falsely endeavour to excuse themselves for an impossibility: There is not I say, any action of the stars on us, besides that of a Meteor: for Astrologers feign many things which they have known to be false; yea, and impossible: the which, in the speculations of the Planets, are on either side easie to be seen: notwithstanding, neither Nature, nor therefore medicine, do admit of the rule of falshood, as neither of the suppositions of Science Mathematical. Therefore lastly, if a popular plague should slide out of the heaven, it should of necessity be, that the heaven should resist and hinder, also, according to the same root, and not as to the later product; and so the whole Art of Healing should prescribe nothing but altogether vain remedies for the prevention of the plague.

But the Schools commit not themselves unto so great wickedness, and they more willingly rush unto impossibilities, that they may make a Buckler for their own ignorance, and may send any ignorant drinkers, and Cup-shot tormentors of mortals against the plague. At leastwise it is manifest from hence, that they do not hitherto assault the causes of the plague before, but behind, and that they have had respect only unto the effects thereof: and so, that whatsoever hath been spoken concerning its prevention, hath in it the meer deceivings of their Neighbours: For they imitate the Countryman, endeavouring to exhaust a Brook where it hastens into the Sea, nigh the shoar, but not by stopping up the Fountain: Therefore, either they do not believe the plague to arise from the heaven, or their remedies are full of despair and deceit.

Furthermore, if the heaven, as it were an angry Parent (as it pleased *Paracelsus* to dream) takes notice of our crimes, and is defiled with our impieties, and therefore as a Revenger wounds us with its darts, and so miserably kills us; Certainly, it shall either be some Deaster, or sensitive living creature, which arrogating the office of God unto itself, and envying the office of the smiting Angels, teacheth us, that envy is a Celestial thing, as also the revenge of the creature on man. But why doth it note our crimes, if in taking notice thereof, it be defiled? and how shall it be defiled, if sin be a meer non-being? how shall that Archer perceive a meer non-being? how shall it judge of the departure of mans will from God? for if it be angry with us, and inflamed for revenge, by reason of [that nothing] how shall it not rather be angry with us, when it shall perceive that we imitate its own actions, and do stop or prevent them? to wit, while the heaven being appeased, we form the plague in us by our own terrours: and it should far more harshly bear it, that man, against the will of the heaven, should heal the plague, that he overcomes

vercomes his own wounds, and prevents or hinders its effects, in despite of the heaven.

Again, if the Plague could by an orderly motion of the stars be declaratively, and as it were, yearly foretold (even as I have already before declared the informations of others concerning *Egypt*) but our offences want a set orderly day, number, and measure: For sins depend on the heart of man, and a free will; therefore that cause is not befitting for its effect, and a sign thereof. But Divines deny the future effects of free-will to be fore-known by the stars, and so, neither that knowledge, nor understanding dwells in the heavens, and inanimate bodies: Therefore neither indeed, do they denounce the plague, wars, &c. to come from sins fore-known unto them. Be it sufficient, that the plague is denounced, not as for an inciting cause, but because it hath so pleased the Eternal: That every guilty person may examine himself, and amend: neither is there need of feigning cause of contagion: and so Astrologers and medicinal Diviners contradict themselves: For neither otherwise, should it be of necessity, to feign an Executioner to be angry with the guilty person, although he kills the same. I pray, why shall our iniquities rather provoke *Saturn*, and *Mars*, than the Moon which is neerer by some thousand miles? Why should *Saturn* who is most remote, be a more potent Revenger of our crimes, than the Moon? For if any star were pestilential, certainly it should chiefly be that which bears rule over the night, rest, and redcement into the first matter.

In the next place, if the plague doth invade us as a punishment, or be sent by Angels his messengers, the movers of the Orbs; Surely, none shall be natural, and the prescriptions and rules of the Schools, as well for prevention, as for curing, shall voluntarily acquiesce. The heaven therefore, is a presager of fore-shewing a thing to come, and it affords signs of the plague, which God reveals to his own: But the heaven is not the effective principle of a present plague, as neither the fore-knower thereof: For truly, otherwise, as well the heaven, as the directive Angelical intelligency should erre, as oft as it should punish a guiltless child with the plague, for a sinner; neither should the habitations of the godly be ever subject to the plague; and God should appoint an unjust Deputy, which should cruelly kill the good with the plague, which should not lay hold on the wicked: He should kill the good, I say, for sins that entered not into their thoughts: or at leastwise from hence it is manifest, that the plague hath its own cause in nature. At length, if the plague were the off spring of Coelestial light; surely, that should alwayes rise up in an instant, seeing the aspects of the stars are by the minutes of a moment: Wherefore the plague, before that (its poyson being bred from elsewhere) it could come down unto us, it should first be dispersed with the wind, should be well washed with the first be-sprinkling of rain, and be appeasingly allayed with the colds of the night and Clouds, before it should descend unto us: and also, those Cities should be punished, which had least offended: and then that also in *Paracelsus* is ridiculous, that the Arching plague, and noter of our crimes, should inhabit in the Sun (wherein God hath placed his own Tabernacle) as it were, an angry and revenging parent, by reason of the contagion of impurity received; Yet that *Saturn*, and *Mars* (he being unconstant, so saith in another place) were the revengers of crimes. Therefore after what manner soever it be taken, providence suffers the injury of the punishing heaven; and God, blasphemy: and so a deceit of Paganisme is included, whether they shall say, that the pestilent poyson is stamped by the stars, or sent from them for the revenge of crimes: or also, that it is framed by the natural course of the stars, through yearly elementary qualities, or extraordinary, or indirect and monstrous ones, directed by Satan. They on both sides dash themselves on the Atheisme of Pagans: For neither hath the evil Spirit that power on us, which the Gentiles suppose; neither is there any other Guardian read to be in a plague sent from God, beside Angels of light; and so it is to have departed from the truth of the holy Scriptures, to have attributed a power of generating the plague, unto the stars, or the devil: especially where the dispute concerning a natural plague, and not that sent from the hand of God, comes in place, and where it is to be enquired concerning remedies, cures, and obstacles or preventions.

For first of all, oft-times the plague begins from one only individual, to wit, from a guiltless child; and so, the heavens had for a purging satisfaction of this child, smitten the whole Family, Town, and at length the Province; to wit, the innocent for the wicked, after the manner of an Apothecary, that Substitutes [*quid pro quo*] that is, any thing in stead of any thing.

Again, while the plague creeps by its contagion, from one unto another; at leastwise, the

the poyson shall be no longer handed forth by the heaven, or a wound inflicted by the heaven, in the second, third, and tenth person; as if the whole anger or revenge of the heaven were stirred up through the fault of the first guiltless person. Again, the plague that is conceived only from the terrour of one that is fearful, since in the most special kind (for no other actually existeth in individuals) it differs not from any other which should be sent from heaven through the poyson of the stars: Therefore neither shall there be any natural plague at all, from the heaven, if it be conceived from elsewhere, by the naked image of terrour, nor that its original stands in need of the heaven: For after another manner, one individual is not constituted by parents differing in the whole predicament: For if the most High created the Physician and medicine from the earth, and the plague be formed by the stars; I at least fear, least all future medicine should be unfit for so great a poyson: But at leastwise, the Lord could not erre, in that he sent medicine from the earth, and not from the heaven. And moreover, the Books of the *Kings*, and *Revelation*, attribute the plague to holy Angels, which is the mark-pledge of Divine Revenge: neither is it lawful to go back unto the evil spirits, and stars, as the beginnings of pestilent poysons.

In the next place, *Paracelsus* writeth, that the plague is beamed forth from the heaven, as it were from an Archer, only into three places; to wit, behind the ears, under the arm-pits, and into the groyns: Wherefore the plague arisen in other members, shall either not be the plague, or of another kind, and of unlike causes, than that which should be the wound of the heaven, is: or next, the heaven hath erred in its darting; or at leastwise, *Paracelsus* hath rashly erred through boldness. Therefore, if other Foreign causes do frame the plague, without the help of the heavens, it must needs be, that there are deprived of their possession and estimation, and that the heaven ought hereafter, to attempt the controversy by way of Petition.

If in the next place, the plague be a wound, therefore it is from external things suffered or undergone; not a Fever, or disease consisting of an appointed seed; and by consequence, whatsoever of Diaphoretick or transpirative medicines they have decreed for a succour of the plague, let it be false and deceitful; and Incarnative and Vulnerary medicines shall be more fit; and a Diaphoretick for prevention, is most exceeding vain, that any one may not be wounded by the Coelestial Archer: For there should be but a sluggish Buckler of a sudoriferous medicine, against an arrow so poysonom, being darted so powerfully, from so far, in a straight line, and with so great leisure; and being most securely led, the weapon proceeding through so many thousand miles of Stages. For it became *Paracelsus* to have known, that the Carbuncle, Glandules or Kernels, Buboës, and bladdery swellings behind the ears, are not indeed, the Pest it self; yea, neither that they are any way wounds, but signs, the product, and effects of the Pest. For because that also, some signates of the Plague are frequently not seen, but after death: Wherefore, that heavenly Slinger should, as oft as he wounded, send in, not the plague, but the effect of the plague: and he had come too late, as to inflict the plague, or wound on those parts in him who had already before died by the plague.

For a certain one being continually provoked to vomit, with headach, dies under continual faintings, within seven hours from the invasion of the sickness: But presently, about the time of death, he is tinged above the Navil, even unto the throat-bones, with a frequent mark, or black print of the stroak. For curiosity sake, since an Anatomist was wanting, I dissected him, and found the mouth of his stomach, now cauterized with a black Elcharre. Lastly, the black marks or tokens, are not wounds, even as neither are the Glandules, little bladders, Buboës, &c. Therefore at least, the heaven doth not wound in the plague; the which, if they are opened, thou *Paracelsus*, callest Ulcers, and distinguishest against wound, and thy own self. Too fabulously therefore, is the heaven defiled with our corruption, and is a revenger of these injuries, even as also, a Notary, and wounder of our crimes: That was an invention of Heathenism in times past, that it might blasphemously extol the heavens and starry Gods into a worship. Four Elements also, are blasphemously and foolishly brought in by *Paracelsus*, who was wont to laugh at the Relolles quality of them; especially because, in the original of our medicine, a Quaternary or four-fold number of Elements is taken away, as well in the nature of the Universe, as in the constitution of mixt bodies: For how ignorantly is a Quaternary of Elements suited with the aforesaid Ternary of emunctory places? For *Paracelsus* having obtained *Arcanums* plainly heroical for the supplanting of diseases, and being destitute of medicinal Science descending from the Father of Lights, and of his own accord, assuming to himself the Title of the Monarch of secrets, and from this boldness, invading

ding the principality of healing, treated of the Plague as it were of an enemy unknown unto him: Therefore he ascribeth the Plague, sometimes to the heaven, at another time to the Sun, and sometimes to the elements alone, and oft-times to Pythonisses or women of a prophesying spirit, witches, and to spirits, as well those infernal, as elementary Deasters, being for the most part forgetful of the doctrine of his own Paramire; where he proposeth plagues of the being of nature, of the being of poyson (as if any Plague could exist void of poyson, or as if some poyson were not natural) of the being of the Stars (as though the Stars were above nature, or without it) of the being of witches (these he attributes unto *Incubi* or devils in mens shapes, hobgoblins, sylphs, &c.) he distinguisheth them also against the being of the Stars, least peradventure witches may be the wise men which are said to bear rule over the Stars, and of a God-like being, and he there forgets his own and an imaginative being, the remembrance whereof notwithstanding, he ought to have had before the rest: unlesse he had rather that an imaginative being cannot cause disease, or that it is no where vigorous, but in the possession of Witches.

And moreover, as I judge a plague sent from the hand of God, to despise the remedies of nature; so also, if there were any proper unto devils, or witches (which is not a thing to be believed) yet at least it should in no wise owe its original unto the heaven: For otherwise, if there were a witch-Plague, it would be far more cruel than accustomed ones are, by reason of an external poyson being adjoyned, and a readinesse of its acting, speedied and enlarged through the wrath of the evil spirit. *P. Boucher* a Minorite Frier, in his oriental or Eastern pilgrimages, tels as an eye-witnesse, That although *Egypt* be otherwise exceeding subject to the Plague; yet that every year, before the inundation of *Nile*, a singular dew falls down, which they call *Elthalim*, at the coming whereof, as many as lay sick of the Plague are readily and universally cured, and are preserved as healthy there from, by the same dew. For if this be true, neither hath it been sufficiently searched into by Prince *Radzevil*; yet not any thing can be drawn from thence, whereby we may know that the Plague is naturally caused by the heaven; since from thence at least it follows, that some meteors are healthy, but others hurtful to some, which none hath hitherto denied.

For although the Sun, the day before the inundation of *Nile*, returns every year, almost unto the same place; yet the same stars do not return as companions together with him: And then, that dew is not the off-spring of the heavens or stars, nor of a meteoric Blas of the heaven: but the day before the inundation of *Nile*, the more high land of *Ethiopia*, being more hot and southerly, was long since overflowed, which sends forth a great vapour from it, filled with *Nitre* (for the whole water of *Nilus* is nitrous) which vapour is not only resolved into a dew (the dew elsewhere weepes Honies, *Terebinthin* or the fatnesse of wood hony, found in good quantity in the summer months, with a manna-ie Being, and *Laudanum*, being as it were gummy things; and among us the *May* dew daily abounds with a sugary salt) and accompanies *Nile* running: but it well washeth the whole aire of *Egypt*, even by moistening it, and refresheth the bodies of the sick, not much otherwise than as a shower doth the earth after long drieths.

At leastwise, I being admonished by the holy scriptures, despise the sooth-sayers of heaven. Therefore if the heaven be the cause of a destroying or devouring Plague, it ought likewise to be the cause of every other Plague: Because the same Being, in the Species, obtains the same constitutive causes, from which the Species it self receiveth its identity or samelnesse. Therefore I constantly deny, that a pestilential poyson is bred by the heaven, or dismissed from the stars: but all Plagues which are not singularly sent from God, for a scourge, are either endemical ones or proper to a Country, or framed by a certain terrour.

But those which are borrowed, as being drawn in from contagion, do follow their own seed and ferment: But an endemical Plague, although it be drawn in from without, occasionally, yet it is not to be reckoned for the plague, unlesse the terrour of our *Archeus* do first frame a poysonous *Idea* of fore fear conceived from the endemical Being, even as shall by and by be manifested. I deny moreover, that any Plague is endemical: For although the aire may invite the bodies of many unto diverse confusions of putrefaction, yet it is in no wise the original cause of a Pestilential poyson: For as all putrefaction differs from the Plague; so in like manner also, the poyson of the Plague differs from any corruption that is the daughter of a meteor: The which, unlesse it be rightly and perfectly known, the nature of the Plague also, shall not be able to be any way understood: and much lesse a radical healing of the same promoted.

For

For a conclusion of this Chapter, I will adde an argument which is drawn from the bank of rivers: For I have seen those, who, that they might avoyd houses infected with the Plague, departed from *Amwerp*; others who fled from the Smal pocks, through which, two years before, they as yet carried about with them, a face bespotted with the scars thereof, which were smitten in the river Scalds it self, with the diseases which they presumed they had avoyded, and had withdrawn themselves as healthy. I remember also, that a certain girl was cured by me of the Leprousy at *Vilverd*, who when shewas now accounted to have been whole for the space of seven weeks, and returned to *Amwerp*, she presently felt in the River it self, the Leprousie to bud again upon her, throughout her whole body: Who at length, returning to me, and being cured, staid with me at *Vilverd* for the space of half an year: nevertheless on the same day wherein she returned home, the hidden Leprousie in Scalds, again re-budded. I have also known women who were readily inclined to a miscarriage, although they travelled the Country in a Coach, and the journey had prosperously succeeded; yet in the river they felt a commotion in their womb, and being carried from the bank by a Coach, that they slide into an excessive flux of menstruous blood.

And so the river strivingly imitating the heaven, steals away the believed honour from the Planets: I speak of Summer; and so neither is cold in the river, then somewhat suspected to be accused: Also the cold of *Autumne*, in travelling the country, withstood or hurt not so much, as in the month called *August*; the river, nor the shaking of the Coach, brought not so much hurt as a quiet sayling: At length, not a watery vapour wandring about in the river:

For truly in journeying the Country on rainy days, the declared calamities happened not: As neither by living about fenny places: but in rivers fit for flowing and ebbing, a few hours hath brought on them these troubles of the Plague, Wheals, Leprousy, and smal Pox, which on land did not arise: For the water twice every day, forsakes the ships and banks, and the bottom is of a strong smelling stink, through an hoary putrefaction: wherefore the river speaks in silence, and proves the hurts of its odour putrified by continuance, which I shall by and by shew: For that thing also, is therefore proper, not so much unto the sea shoar, as to the bank of rivers: For there is no hoary putrefaction at the salt Sea, and sand of its bottom, such as is in half-sweet or breachy rivers: wherefore their waters are scarce ever altogether clean, and they want an odour proper to themselves.

The Heaven therefore is free from our contagion, as also being innocent of the accusations of the ignorant, it wants the fault of revenge. They are the Reliques of Paganism, the which, unlesse the School of medicine shall shun, let it know, that the giver of lights will not reach forth his benefits unto them.

CHAP. IV.

A forreign new Plague or contagion.

ALL diseases have not come at once into the place of exercise: surely the ages of our Ancestours were happy, wherein, but few infirmities had bent their sword against man weaknesse: And the product following upon *Adams* transgression, hath by degrees adjoynd the principles of nature with us. For Astrologers do as yet to this day flee together unto the limited positions of the stars, unto the wraths and un-co-sufferablenesses of their oppositions, and the conjoyning combates of malignant lights: whereby the first Fever, first Apoplexy, or first Plague was bred. For although I am not wont diligently to search into things past, which may not profit, but hurt; and much lesse have I accustomed my self to enquire into those things, the demonstrations whereof I could not obtain, give, make, or hope for; yet I could not but deride the folly of *Paganisme* referred on the stars.

For I could the more easily assent unto Astrologers, if a Fever being once bred, and an Apoplexy having arisen, they had ceased when that constellation ceased: Also if they could demonstrate in what Inn, the while, they should inhabite, the displacing of feverish stars being once divided or drawn into diverse parts. Wherefore in the book of long life, I first was constrained to describe the entrance of all diseases and death into humane

nature, from their original: And so I clearly understand, and seemingly behold, that they were the reliques of paganism, whosoever hath dared to extend the offices and ordinations of the Stars beyond the text of the Holy Scriptures, which saith, that the stars are to us only for signes, seasons, days, and years: For if I should assent unto judiciary Astrologers, I should suppose a feverish, or Pestilent seed being once bred, to have afterwards entred into nature; nor indeed, that its generation did continue thence-forward, as the off-spring of a certain curse, but of creation: But since most diseases do at length end into health; if at leastwise they do not die with the sick themselves, and for the most part without the raising up of a new off-spring; it should of necessity be, that if they had at sometime begun by reason of unlucky lights (a ridiculous, or blasphemous word for a Christian) neither could they begin without them at this day, if those lights having thus con-joyntly encountered, are to be judged the efficient causes of diseases.

Therefore I beleived, after that I had more fully unfolded the re-solutions of hidden bodies by the fire, that there were from the beginning, the same principles and rootes of diseases, which there are also at this day: The which, I have cleerly enough demonstrated in the section of the original of medicine, in the treatise concerning diseases in general. I have also beleived, that some diseases in the beginning, were as it were in their infancy, more gentle, and that they had more swift progresses, and also more easy extinguishments, by reason of the former strength of humane nature; yet that some diseases were in their beginning more fierce, the which indeed, do not so adhere to the roor of humane frailty; but are attained as companions with a Plague or contagion, as being forreign: For as natures were in times past, more strong, the which as they are the recievers, so also the Physitianeesses of diseases; so now, I experience the seeds of diseases daily to profit, to make a more strong impression, and to wax very fierce; and that our nature, by how much the longer it goes on, and the more unseasonably proceeds, by so much the more negligently also, it hearkens unto remedies: For indeed in the days of our Fathers, the *Lues venerea* or foul disease, till that time hitherto unknown, arose, together with its chambermaids and lackeys: But the 1424. year, and the siege of *Parthenopolis* or *Magdeburg*, and the age of that *Lues*, and the first nativity thereof, is taken notice of. At length, whatsoever hath once grown tough in our possession, although it may perish in those individuals, yet it afterwards keeps its particular kind, and scarce knows how to dye, as long as the command of him remaines, who sendeth a spot into the flesh: As the Scurvy, Plague of *Hungary*, &c. unknown to our Ancestours: but our stripes increase daily, because impieties also are multiplied.

Truly diseases are changed, are masked, are increased, and do degenerate through their coupling: therefore henceforward we must deliberate with a more earnest thought, concerning more profound remedies: but from the growing worse of a disease, I have conjectured, that a more secure art of healing ought to arise, than that which hitherto by frequent blood-letting, and the poysonous resolving of laxative medicines, their bonds being con-joynded, fore-timely draws mortals into the place of burial; For I guesse at it, because I see the *Lues Venerea* to change other griefs into its own obedience; and that the plague also will in this respect be degenerate; and indeed I have at sometime read in the revelations of *St. Bridget*; also in the lives of *St. Dominicus*, of *Vincentius Farrerius*, of *Coletta*, &c. that in an unanimous apparition, they saw the Saviour of the world to be angry at the impieties of mortals, and to threaten the destruction of mankind with three darts: by reason of which apparition, it was, that *B. Vincent*, as soon as in a super-intellectual rapture at *Valentia* of *Spain*, he had seen *Coletta* the reformatresse of the Order of *St. Clara*, prostrate on her knees, before the holy-sacred Trinity, he earnestly intreated the aid of the God-bearing Virgin, that Christ the Lord might divert that purging satisfaction which was threatned for a deserved punishment; and his country of *Valentia* being forsaken, he came to *Gaunt* to see *Coletta*, whom he presently knew to be the same woman which he had seen in the aforesaid rapture, and sought for. For coverousnesse there was a dart of Wars, whereby goods badly gotten, and badly reserved are taken away: for pride, there was in the hand of the Almighty, a dart of want and famine: But Ecclesiastical or Church-men, whom these kind of sins do for the most part touch, he threatens to chase with both launces from their possessions, they being heaped up, and badly used, contrary to their vows: and at length against luxury, he bare a dart of contagion or infection in his hand. Truly *David*, chose the plague instead of war, and famine, not by chance, but from a higher guidance; because the whole people, after the Kings example, were fornicators: At leastwise, that is singular in the aforesaid

foresaid vision, that it appeared unto divers Saints, and in divers years, and indeed before the coming of the Lues or Pox; because there is not a word which the Lord hath not revealed unto his Prophets.

Last of all, under the fulnesse of daies, under the maturity and compleated number of sinners, the long-suffering God sent one of the three darts into the middle of the flesh, and forthwith the *Lues Venerea* appeared, being plainly cruel, poysonous, and killing with a poysonous putrefaction. But afterwards, other sicknesses; yea, and the plague it self, contracteth a blemish thereof: neither do ancient diseases any longer answer unto the descriptions of our ancestors, neither do they shew forth the accustomed obedience of a league with remedies: for in times past great armies were led up and down, and beyond Europe, into *Asia* and *Africa*, without any notable contagion, and on both sides almost, the same numbring account of souldiers was found; but now presently after a siege is begun, they within the Garrisons die, and also the besieging camps, and straightway a popular plague succeeds a speedied vanquishment: for scarce one onely band of the souldiers of a garrison goes forth abroad, the which waggons laden with sick men do not follow, although it laded the hospitals behind it. The chief Chirurgions do bewaile with admiration, that but so lately, any the lesser wounds do scarce any longer obey the wonted medicines. Moreover that *Lues* or Pox, is read to have been first seen in the siege of *Naples*, in the year 1494. Physicians also attempt the rise or original thereof by conjectures: for it hath pleased some to attribute the nativity of the *Lues* unto the West Indies, and that there it was natural and accustomed: but others have been pleased to accuse the Eastern climate; notwithstanding, that the West Indies were free, *Ferdinandus Cortesius* himself witnesseth, who was the vanquisher of the same; and that after his coming, he had not yet taken notice of it there to be; but that the Pox was brought thither with an *Ethiopian*, a bondslave of *Pamphilus* of *Narvaz*; for perhaps he had newly brought it thither, and brought it with him from the siege of *Naples*: for seeing the *Lues* began there at first to be seen, it hath been disputed among Nations, whether it ought to be ascribed for a triumph, to the *French*, *Spaniards*, or indeed to the *Neapolitan*. In the mean time, none ever accused the *Portugal*, and by consequence the *East Indies* were free: for the *Portugal* was not in the siege of *Naples*, who from an ancient hatred, willingly promoted the wars of *Castile*: yet the *Portugal* alone, with an excluding of the *Spaniards*, had viewed the *East*, and subdued it to himself. Neither doth it hinder these things, that the *Lues* or Pox was for a long time since accustomed to the *Chinoys*: for none came from thence unto the War of *Naples*: therefore, if it be true, that the *Lues* excels in antiquity in *China*; it might there have begun from the same Beginnings, even as they had Guns, and Printing before us: At leastwise, the venereal plague or Pox is no where from Endemicks, nor from an infection of the aire; from hence also, it is not every where popular: but that the *Lues* was not brought from the *Chinoys* unto us, is manifest from *Guaiacum*, the use whereof among the *Europeans*, is eighty years elder then that of the root of *China*: And then, because the entrance into *China*, is forbidden unto all forrainers, upon pain of their head: the Pox was then never seen in the coasts without *China*, whither notwithstanding, the *Chinoys* yearly ran out of their own borders for commerces sake: But *Guaiacum* came from the Western lands. Others perhaps, therefore contend, that this plague of luxury began, because the dearness of victual had perswaded, the fleshes of dead carcases that were slain, to be filched away, and being privily boyled, to be sold; but since with the men eating Indians, this *Lues*, before the coming of *Pamphilus*, had been unknown, the alledgement of these is not received. Astrologers also with whom the causes of all accidents are referred unto the aspects and revolutions of the Stars, that they might not grant any thing to come to passe without a co-operation of the Stars, say that a strange scituation of the Stars had then an influence onely upon *Naples*; the which they seeking with much perplexity, have not yet found: as if the same scituation of the Stars had never been before; for the holy Scriptures gain-say this opinion of the Astrologers, as I have already proved above.

At length, *Paracelsus* unconstantly searching with earnestnesse, in many books and additaments, accuseth and detesteth the copulation of a leprous Harlot with a scabbed French souldier: As if indeed no leprous whore had been before co-mixed with a fordid French-man? But it is sufficient for a refuting of this; that *Paracelsus* herein also is unconstant to himself, who denieth in many books, that the *Lues Venerea* is by it self a disease, but he permits it to be onely a page unto other diseases; notwithstanding every contagion, whether it be contracted from the Leprouse, or from the Pest, or else
where

where, is truly and actually a disease in it self: neither is it a wonder also, that the cause of the Pox is hitherto unknown by those who have had respect only unto the contingencies of nature: I rather believe that so many apparitions to Saints were not in vain, and shewn unto them without their scope or purpose. I therefore believe, that the beginnings of the venereal plague was drawn and planted into nature from a dart of divine anger, violently cast, and no otherwise than as at the pouring out of the phials, the third person of mortals shall at some time perish: Not indeed that I will have the plague of lust to be accounted altogether miraculous in its beginning, because it began from a hainous offence: For I know, as in nature, it now hath, so also that in its beginning, it found a ferment and root therein. And moreover, a certain Layick and holy man, being wont, at some hard questions, to receive dreaming visions, and oft-times also, through the abstraction of his minde, intellectual notions or knowledges, perhaps from too much curiosity, narrowly searched into these questions. 1. Why that venereal plague had broke out in the fore-past age, and not before; since that in the fore-past daies of Pagans, any wicked impudent wantonnesse was never wanting? 2. From whence, if not from the Indians, it came into Europe? 3. What may be the cause of its continuance, and mitigation, and changing, if it were come from God? For Miracles do seldome pass over by way of contagion, and unlesse a command be delivered, obtain their cause in nature: But neither is God wont to punish the guiltlesse, even as the Lues veneris oft-times infecteth the innocent. The Layick said, that he saw in an intellectual vision, an horse, which flowed almost all abroad with a stinking ulcer; which disease being proper to the horse-kinde, our countrey-men call, *Den-worm*; but the French *Le Farcin*; whence horses do by degrees perish with a corrupt mattery rottennesse: but he saw this horse as it were designed for meat to dogs, having his whole back vitiated, also about the vessel of nature: neither had he any other answer, besides that vision: wherefore he said, that he supposed, that at the siege of *Naples* (where this cursed contagion at first arose) some one through an horrible sin, had carnal copulation with such a horse-beast. At leastwise, from thence I conjecture the rarity of a disease not before seen; because I cannot easily believe that ever such a sin was in the like terms committed from the beginning of the world: and it is a disease like unto the *Lues Venerea*, and akin and familiar unto the nature of the horse: And therefore it might (God the avenger so permitting it) have naturally transplanted its own ferment into the family of man, although it was before divinely threatned: That the Mares contagion, I say, might have mixed in the act of lust not to be spoken of, it then propagating the *Gonorrhea* or running of the Reines, the Cancer, and venereous Buboes, &c. even so as at this day, the Pox it self is attracted from a filthy whore, even into the testicles of a man: But I cease to be the more curious, as oft as a thing being known, is of no use; unlesse happily thou hadst rather meditate from hence, that horses thus ulcerous, are cured by the remedy of the Pox; and on the other hand, this by Quicksilver most exactly prepared: At least wise the consideration of the Lues serveth for a degenerate, and at this day multiplied plague, and many of which are threatned in the holy Scriptures under the coming of Antichrist.

I adde, That it is infamous, and hath infected every corner of the world; it hath also manifestly shewn by the effect, that it is a common satisfactory punishment of the flesh, and creeping unto a further, and as yet a commonly unknown mark: For indeed at its first beginning, it not only stood a good while unknown, but also its healing was unsuccessfully attempted, and at this day is commonly unknown: whence it follows that the life of mortals being enraged by uncertain and cruel medicines, is now humbled, even before the youth of every one; which weaknesse promiseth a certain lasting continuance of perpetuity, and in abstinent persons, unto the fourth period of generation at least; yea, although a large company of men have never contracted the Pox: Nevertheless, since the Lues is scarce ever well cured, and the reliques thereof have remained; surely there do those survive, who having experienced the rashnesse of Physitians, are made far more weak then themselves were: For there is a radical part of poyson, which hath remained in their possession, besides the horrid tortures of oyntments, perfumes, and salivations; and it must needs be, that in that respect their successors are diminished with a notable weaknesse; For the *Lues* is not indeed a disease, consisting of a matter [whereof]; but onely a poysonous ferment is affixed to the solid, or liquid parts of our body, like an odour: And so (the which is singular to the Pox) it incorporates it self, not onely with the constitutive parts, but also with the excrements, or with the matters of other diseases, which it toucheth at; because it affecteth them, and is

is co-mixed with them: and since it is easier to defile a matter with poyson, which is newly appointed for an excrement, then a part as yet alive, and so also for this cause resisting:

Hence it comes to passe, that whosoever have the manifest, or hidden beginnings of any diseases whatsoever, they do easily contract the Pox disease, and therefore also it transplants it self into various masks of diseases by an association: for in many it produceth ulcers, and wheals; in others, it gnaws rottennesses in the bones, it rises up hard swellings, also it causeth Buboës about the groyn, phlegmones or inflamed apostemes, and corrupt mattery apostemes, as also wounds stubborn in curing: elsewhere also it hath brought forth palsies, gowty fits, the jaundise, or dropsie, &c. For that thing deceived *Paracelsus*, he thinking that the Pox was not a disease in it self, because it adhered to other diseases; For a curse now coming upon nature, impute from its original, doth not proceed by an accustomed generation, but it findes its own body pre-disposed in the body of other diseases; so that the likeness of conception, nativity, subsistence, and effects in a strange body (to wit, that of man) do produce a likeness of the rise of the Pox, as of other diseases, because they in a like manner issue from the fall. Diseases therefore, that from the rise of the Pox are become degenerate for the future, those do for the most part imitate the right or customary manner of some poyson: neither hath any one sufficiently searched into the causes of these, wherefore indeed, most diseases have become contagious, more cruel, more frequent, and more slow and difficult of sight, than in times past. For the Pest is undoubtedly more frequent then it was wont to be, it catcheth hold on us upon the least occasion, it cruelly infects us, and is the more readily dispersed, because it is joyned unto a new poyson: For many, as it were despairing, have thought that the strength of our nature doth thus run down unto its end in a short space: But the Word of God hath a stable Government: there is not any defect of these incorporated with the humane species; but adhering onely unto individuals by accident; and seeing every foreign adhering matter is subject to a separation, and no strange thing is fit to be conjoyned pithily to the image of God, in constitutive principles: Therefore every foreign matter doth of necessity receive its birth, increase, ascent, state, declining, and death, and at length also, of its own accord, expecteth a restoration by further propagations: For the seeds and species of the word are durable for ever. Hence it follows, that a foreign guest ought at length to depart from the fold, whereinto it hath heevishly crept, through a privy error: Because the power of the Word suffers a prescription by no seasons, length of motions, or daies, as neither by the wiles of the enemy. The flood indeed over-covered the earth, because man had corrupted his way: And therefore at this day also, by reason of sins, an infirmity hath made it self roome amongst us, it groweth new daily, and besides, another is about to threaten us. In the year 1540. under *Paul 3.* about *Autumne*, a *Tarantula* first appeared in *Apulia*, nigh *Tarentum*, being a monster, so called by the City; like unto a spider; but twice bigger: The which afterwards remained in the species, and from the land of *Tarentum* was now also transplanted into the Roman land: For according to *Daniel*, every monster growing up on the Commonwealth, comes from the sea: new flatterers are confirmed by this monster, who befool or make men mad that are bitten by them, and they trippingly dance with exceeding gladnesse, as if they had done well in believing flatterers.

In the year 1550. in the sixth moneth called *August*, the *French* first saw wheat, which they call bedewed or honyed wheat, it representing in its ear, being as yet green, a smoaked or red-herring in its smell; but in its ripe ear, nothing but a stinking black powder: I wish, not the cause of any popular diseases. It is a stroak or punishment which steals from us a great part of victual; for cockle or tares is sown against the more mighty Prelates: the which I wish they knew, and did foresee.

In the year 1556. The Scurvy first appeared in our sea-coasts, being unknown to the ancients; the which infects the gums, and breath, and legs; because it also besiegeth the most inward parts. In the same year there are men remarkably noted, being admitted of in the Low countries, subverting within and without, those that rashly believe on them, with a sweet contagion. Not so long ago a camp-fever assaulted our countrey-men, with a deep contagion, killing without thirst and heat; and they are denoted, who under a shew of Piety, spread new and suspected opinions among people in families. But at leastwise, nothing which is once hostile, doth afterwards kill in its own kind; because it is sent into us for a scourge, and we being blind, do not diligently search into the occasional cause, deadly mean, end, and remedy: For they at
this

this day accuse the impurities of Camps, Fens, houses, together with the poverty of souldiers, as the causes of unwonted sicknesses, and among Physitians, the whole preservative is conversant about this occasion: As if indeed Camps were in times past purer, whilst Plagues, and unwonted Fevers not as yet were: For I know, that as oft as a Fever falls on the body, from the pedigree of antient ones, which actually suffers the *Lues venerea*, or which at sometime had it, and being badly taken away, that that Fever forthwith associates it self with the poysonous sweepings or reliques of the *Lues*, from whence it borrows poysons, which began to be called a malignant and Camp-Fever: and that it propagates it self by its contagion, even on those that are free from the Pox:

And it is indeed, of the Fever its father, and the *Lues* its mother, being a third monster divers from both parents, as being from diseases distinct in kind: From hence surely, as well a Fever, as the Plague, have become masked and unknown: For so the *Lues* proceeds to be dispersed in a feverish *Chaos*, and is made to be of a common right: For the unluckie monster of the *Lues*, being unlike unto both parents, is a treacherous poyson, and becomes a striving imitator of the plague: And by a new ferment of putrefaction, it produceth the Plague it self to be more cruel then it was wont to be. It is not therefore an absurdity, that Camps at this day do stir up many sick souldiers, more frequent deaths, and those Fevers more malignant in contagion: Neither do more ready infections undeservedly follow Camps, than otherwise, the more populous Cities: because the souldier is a nigher object of the Pox, than Citizens. The Plague therefore finding a fewel for its spark, doth easily return.

CHAP. 5.

The Opinions of the Ancients.

THe Pest is in every age reputed for a punishment sent from the angry Gods. Therefore *Hippocrates* names every blemish of contagion, wholly, in diseases, Divine. The Heathen do as yet to this day flee over to their Idols: The gods of the Nations are devils. But we Christians have recourse unto the one onely eternal Power, and do implore the aid of Saints, because God is glorious and wonderful in his Saints, who by request obtain those things which our unworthinesses do deny us. For there are Cities in the Neatherlands, wherein the fellowship of Saints, Patrons in the Plague, hath for a long time hitherto, kept the Citizens free, as many of them as were sent for the succour and service of those that were defiled with the Plague: For none that was sent by a head-fellow-Citizen, and companion, although he readily served him that was infected by the Plague, was ever laid hold of by the Plague. So it is: The hairs of every ones head are numbred: A leaf falls not from the tree, without the permission of God: much lesse doth any thing happen unto us, besides the permission and fore-knowledge of God. So it is true; a certain Plague cometh from the hands of the Lord, the which to avoid, is impossible: because it comes from him who cannot erre in arching. Therefore I have decreed not to write any thing at all concerning this Plague, as neither of the curing of a miraculous one: For if a natural Plague be healed by a miracle, that belongs not to a Physitian: very many of us also are of opinion, that the Plague is not sent but from God, without the concurrence of a second cause. The *Mahometans* also, with the *Calvinists*, believe the Plague to be the lot of an unavoidable Predestination: Neither therefore do they avoid infected places, or bodies, as neither any hurtful things: being badly constant to themselves: for truly a wild beast cannot hurt without the consent of the Lord; and so in this respect he is not more hurtful then the Plague; yet they beware of and defend themselves from wild beasts. *England* also hath hitherto wanted the proper name of the [Pest] and the which, from times past, it nameth [Plaga] the Plague or stroake. As to what pertains to the causes thereof, the *Greeks* first, and afterwards the *Arabians*, and whosoever have dedicated themselves to either of these two, do collect the Pest or Plague into two causes.

The

The first whereof, they name *Catarritical* or fore-going causes; but the latter, con-nexed, conjoynd, containing, and immediately accompanying ones: and indeed, when they saw the body of man, by its individuals, and places of its habitations, to differ in great variety, they devised a universal cause for the plague; to wit, they being seduced by Astrologers, blamed the heaven, that by its hurtful light and motion, it be-sprinkles the air with a cruel gore; the poyson whereof, they have therefore named an Epidemical or universal one: and although they saw diseases infamous in contagion, to arise through occasion of Pools or Lakes, Caves, poysonous soils, Minerals, Filths, Mountains, the natural moistnesses of the earth, of a valley, or sink, or privy, from whence divers putrefactions sprang; yet they never esteemed the disposition of these diseases to be the Pestilence; but by a separated name, they called them Endemical ones: which distinction, presently laid every doubt asleep, and they themselves have snorted in this deep sleep, being glad that they had banished their own ignorance unto the heavens, for a universal fault: and they thought themselves secure, not any thing distrusting, that the heaven could vindicate it self from blame, but them of ignorance. They likewise separated the dead, and those that were about to die, in detesting their obediences, that it might not be heard of, neither that they might accuse the carelessness and ignorance of Physicians: Especially, when as the chief Physician always runs away, forsaking his own sick Patient in his despairing of life. Wherefore they call the Diviners of the stars together for their aid, that seeing the world defends the errors of these men, they may defame the heaven with a conjoynd accusation of a fault, that it defiles the air and water with the consumptive poyson of an abstracted light.

But *Paracelsus* being much more bold than his Predecessors, would have the heaven to be really infected with our contagion, to note our sins with a pen of iron, and unwillingly to receive them; therefore, to be a revenger, and to stir up deaths: But that the Plague is a meer wound, that it is darted from heaven; that the stars, by wounding, and in running, do us hurt; and that these wounds are made only in three places, and not in more (as not knowing, that these are our emunctory places) to wit, behind the ears, under the arm-pits, and in the groin.

In another place also, he appoints, not three, but four plagues, according to the number of the Elements, that every one of them are to be vanquished by a four-fold and much different remedy: But elsewhere, he also deviseth a fifth plague, being sent into us by *Gnomes, Sylphs, Nymphs, Satyrs, Hobgoblins, Gyants, or Faunes*, because perhaps, he supposed these to be a fifth Element. Moreover, he being entreated by the City of *Sterzing*, for a choice Antidote against the poyson of the Pest, forsaking his former starry and Elementated remedies, in the end, wholly trusted to a drink of *Triacle, Myrrhe, Butterbur root, Terra Sigillata, Sperma ceti, the herb Asclepias, Pimpernell, Valerian, and Camphor*, with the best *Aqua vite*; to wit, through inconsiderateness, he as unmindful, being snatcht away into a hundred confusions of simples, by him many times and seriously detested but a little before.

In the next place, neither do those things agree together, that he elsewhere, hath often, not any thing distinguished the Element of fire from the heaven: and nevertheless, that he hath delivered four plagues, distinct in their original, cause, and remedies, the which he had dedicated unto one heaven, which in another place, he would have to be the only Author of the Pestilence. He willeth also, that *Christal, Arles*, and likewise *Gemms*, are bred in the air, and do fall down from heaven, the which he, as unmindful of himself, nameth the fruits of the water, as willing *Christal* to be nothing but meer ice constrained by cold. At length, the Pest, seeing it is a malady of the heaven, and of the fourth degree; yet he saith, that the tincture of *Gemms* is the best solidative medicine of that wound; and so also, that a remedy of the second degree, should cure the plague of the fourth degree.

I also pity the vain tiresomeness about remedies, which among a thousand Alchemists, scarce one prepares: For it is a frivolous thing to compose so many books, and at length to have run back unto remedies which are scarce to be gotten, in a popular disease, and every where obvious: For it is a frivolous thing in a wandering plague, to nourish a whole Country with the fleshes of the Stork, which flies away about *Autumn*; or with a Lyons Tongue, hung on the body: For all such things discover ignorant boasting, but not a common charity, in so miserable a grief: For neither hath *Hippocrates* chased away the plague out of *Greece*, by such remedies: For otherwise, the poor man (if the plague should be put to flight by precious remedies and victuals) should with the despairing of his life, the unequality of Fortune, much bewailing, and just grief, ponder, God to be a respecter of persons, and

remedies to be denied unto him. I therefore shall never believe, that God, in Nature, was less careful in curing the poor man, than the rich: For the history of *Lazarus*, and the rich Glutton, doth wonderfully comfort the poor. Lastly, *Paracelsus* hath set forth books of a plague generated by Pythonesses, and Hobgoblins: By Hobgoblins, I say, Satyrs, &c. which he denieth to be evil spirits, which he maketh coequal unto Witches in generating of the plague: Yet hath he neglected to add remedies for such a pestilence; as though the title of the Monarch of Secrets, being presumptuous on himself, it had been sufficient for him, not to have trod in the footsteps of those that went before him, and to have stirred up very much smoak, and little fire, and to have exposed the memory of himself unto laughter. For his books of the Plague, of Tartars, of Minerals, &c. do contain much of prattle, but little of trusty aid.

CHAP. VI.

The Pest divided.

THe Paramire of *Paracelsus* is totally employed in perswading, that every disease without exception, and by name, the Pestilence, is in its whole species five-fold; to wit, being distinct in its causes, original, properties, and remedies. But the first kind, he calls a Natural Being, originally proceeding from elementated fruits; and this plague, he hath described in his books of the plague and pestilentialness, wherein he is there his own Interpreter. But since it is manifest that the fruits which the Schools have believed to be of mixed Elements, are of water alone (even as I have elsewhere clearly demonstrated concerning the rise of medicine) of necessity also, the doctrine of the Elements, at least for the Pest, now falls to the ground: and then, another predicament of diseases, he calls an Astral or Starry Being, as it were raining down from the starry heaven; and in many books of the Pest, he prosecutes only this kind of Being, others being omitted: and so, seeing he elsewhere confound the heaven, and the fruits of the heavens, with the Element of fire, an Astral plague shall also again be co-incident with a Natural and Elemental fiery one: and then, a third most general kind of diseases, he calls the Being of poyson; as if there should elsewhere be a certain plague void of a poyson; and as though a plague could have its poyson, without, above, or besides a Natural Being. Thus therefore he distinguisheth, as being fore-stalled by an Idiotism, the stars, against the Being of Nature: But at least, as if a natural, and Astral plague, were not of a poysonsome nature? At length, the fourth kind of diseases, he calls a Spiritual Being; to wit, the evil spirit co-operating, together with his bondslaves.

Hitherto also, he refers the execrations, and desperations of men: But first of all, he omits his Faunes, Hobgoblins, Nymphs, Satyrs, &c. unless happily, he will have these to be the companions of *Cacodemons*: at leastwise, he neglects the chief hinge, to wit, his own phantasmie, when as terrour or affrighting fear alone, generates no seldome plague.

And moreover, he supposeth a spiritual external Being to be the essential cause of the Pest; to wit, whereby the species are only to be divided: and so, he distinguisheth of two effects diuers in kind, only by external occasional, and accidental causes: For it is certain, whether the Witch as a Sorceress, should connex a pestiferous contagion unto any one, or that be done by any other means, and by a proper vice of nature; at leastwise, the plague issuing from thence, is on both sides one and the same. Last of all, he calls the fifth kind of diseases, a God-like Being, or that of the faithful, stupidly enough, in not distinguishing God from diseases themselves; even as otherwise, it is a free thing, in no wise to have separated Nature from her own effect. But he hath no where made mention, even in his largest writings, of a Deal or God-like plague. But as to what belongs to my self, I do not admit of an Astral Being, although *Paracelsus* hath made that common, not only to one of the five; but being unconstant to himself, unto all pestilences universally.

I likewise, in the next place, confound the Being of poyson with the Being of Nature: For if it doth not contain a poyson; neither also, for that cause, the plague. But since the Pest hath a separated birth, and progress distinct from other diseases, being not a little
tyed

tyed up unto imaginations and terrours : In this respect, I make every plague to be spiritual : not indeed, therefore to be of a Witch, but to be tributary, and meerly natural to the disturbances of the *Archeus* : But if indeed, the *Cacodemon* or evil spirit co-laboureth for the destruction of man ; it shall indeed, be the more fiercely transplanted, and wax cruel ; yet there is not (although his *Paramire* thinks otherwise) need of superstition for this thing, nor is that plague devious from that of nature, because a spiritual Being, doth evidently, whether he will or no, always war under Nature. Therefore, I acknowledge two only plagues different in kind ; to wit, one which is sent immediately from the hand of the Almighty, by the smiting Angel, for the execution of the hidden judgement of his own Deity : For this, although I acknowledge it to be a pestilence ; yet I wholly commit the same unto my Lord, and say with a resigned mind, *Let thy will be done, O Lord* : For truly, neither do I wish for a remedy, but according to thy own good pleasure. Finally therefore, I will every where touch only at the pestilence of Nature, as a Philosopher ; and I call that, the other plague.

CHAP. VII.

The conjoynd cause of the Antients.

IN diseases universally and without exception, I at sometime, in discoursing of a disease in general, have acknowledged no efficient and external cause, besides an occasional one only. Now moreover, I have shewn, that I have justly denied to give the heaven passage unto the plague ; although in the mean time, the Blas of a Meteor may be able to dispose the suffering subject unto a more ready impression of receiving. Therefore I will first apply my self unto the connexed causes of the Pest, which we read to be referred by the Antients, into the corruption of humours, and inflammation of heat ; and therefore their preservatives written down, are supposed to be adjudged only by way of resisting the putrefaction of humours. But the Schools have not yet explained, what that vitiated humour enflamed with heat may be, or with what name to be endowed, which may be the fire-brand of the plague, in the veins, bowels, or habit of the body : and they have not yet known, that in *Egypt* a destructive plague is rather extinguished than incensed by great heats : Even as among us, that the pestilence is for the most part, rather in Autumn, than in Summer : For sometimes the Schools run back unto Endemics, as well those domestical, as forraign, the which are believed to incite and heap up putrefaction after any manner whatsoever.

In the next place, for preservatives, they scrape together any simples, although hot ones, so they are but commended by the faith of Herbarists : But the doubting of the Schools, as also the unprosperous uncertainty of remedies, is every where covered with the ridiculous event of divers complexions ; the which surely hath been hitherto a common and thred-bare apiness or fitness for excusing their excuses in death : and at length, through the great fear of Doctors, of the plague, the distrust of the Schools is discovered to be beyond the Laws, and promises of books : at leastwise, they assuage the unlucky obediences of the sick, by one only saying, *It so stood in the Destinies* : Therefore, that they must patiently bear it, because that, or the other miserable man, was referred into the Catalogue of those that were to die.

In the mean time, the work of the plague is cruel, but more cruel is he who brags of help, and brings it not : The progress of the plague is swift, by reason of so great sluggishness of Physicians : The venom in the plague, at leastwise, is not quieted at one only moment ; neither doth that admit of peace, which despiseth Truce. If therefore there were any humours corrupted in the Pest, in their being made, through putrefaction, seeing they cannot return, and be reduced into their antient brightness of integrity, and the first, and chiefest natural betokening of diseases in the Schools, is most speedily to pluck up the hurtful humour, and that all succours are vain, but those which do readily and fully sequester the offending filth ; It should follow, that their universal succours (to wit, purgings, and cuttings of a vein) are the most potent helps of the plague : The which notwithstanding, are already many times found to hasten on death. That supposition also, of necessity falls down together, which introduceth corrupt humours for the immediate

cause of the plague: For in very deed, the Pest, doth rather infect the nourishable humours, than that these are the cause of the Pest: Otherwise, I have elsewhere made it sufficiently manifest, that nature doth not acknowledge, nor ever had humours in the constitution of the blood: Wherefore, neither are these able to cause any thing, because they are non-beings.

Again, if humours in the making of their putrefaction, should be the connexed cause of the Pest: at leastwise, the Schools ought to have set forth the name of that humour, and likewise to have expounded the manner and process, whereby those humours are corrupted, and how, they being now corrupted, are the conjoynd cause of the plague: and also, after what sort they may be speedily sequestred, together with the hinderance of their impression on the vital parts. It had behoved them in the next place, to point out the place wherein the assembly of the foregoing pestilent corruption, as it were in a Nest, was held. For if this center be the veins, or bowels (to wit, where the first sequestration of excrements happeneth) all sweat should be altogether hurtful; because it is that which should bring the poyson from the stomach, or liver, through the vital bowels, and not pour it forth neerer, thorow the accustomed sinks: For so the *Lues Venerea*, only by a *Gonorrhea*, chusing its mansion in the Testicles, if by solutive medicines, it be drawn back from the shops of the urine, that it may go back through the veins into the paunch, It spreads a necessary *Lues*, only by that passage, into the whole body. Much more therefore should the Pest, if it had defiled the humours in their own shops, and should be brought forth, in passing thorow by sweats, infallibly defile all of whatsoever is vital within. But if indeed, the habit of the body be the place of the putrefaction of pestilential humours; now the Diet of Physitians shall be ridiculous, which is believed to hinder the generating of putrifiable humours.

In the next place, from what, and from whence, putrefaction in good juicy blood, should arise in the habit, or also in the center of the body, before the plague, not any thing hath been determined by the Schools concerning all these things; as thinking it sufficient to have said by the way, that the corruption of humours is the conjoynd cause of the plague, because run-away Doctors have never beheld this, but asquint: For when they observed, that a laxative medicine being drunk up, the flesh and blood being consumed by that venom, and a yellow humour, or pale snivel, or the more dark blood, not yet fully transchanged, did flow forth; they affirmed that, not only the venal blood, but the whole body, did consist of four humours differing in kind, and that they were again resolved into them: Even so, that they have supposed this putrefaction for the Pest, to be begun in yellow Choler, being compared to fire, or in black Choler, and therefore called melancholly, as being neerer to earth, *Saturn*, and malignity.

Truly, although I have elsewhere abundantly demonstrated four humours as a frivolous and hurtful invention; yet let us now grant, by way of supposition of a falsehood, that the blood did consist of a commixture of those four humours; yet when the blood hath now ceased to be, and is by a formal transmutation, changed into a nourishable and vital liquor, which immediately nourisheth, increaseth, and cherisheth every member; it at leastwise fights with the truth of Philosophy, that that nourishable liquor being degenerated from blood, by a formal transchanging, had not yet forgotten its former condition, and compacture. Suppose thou, if Wine, Ale, the liquor of flesh, with the juice of potherbs, be drunk at one meal, and changed into blood; certainly that constitution of the blood is not one, as long as it consisteth of those four divers things being as yet co-mixed: but those four are made only one, while as by a formal transmutation, they are made a new product, which is blood. In like manner therefore, although the blood should consist of a connexion of four humours; yet seeing they are now one, and no longer four; that one thing constituted shall be no longer that thing, connexed of the four original liquors granted: Neither can the diseases resulting from thence, either insist or be accounted as humorous in healing; they not being any more able to return back into those four feigned humours (although they are granted to have been real ones) than the blood that is once made, can return into the former Wine, Ale, Broath of flesh, and juice of potherbs. It is manifest therefore, that the Schools, contrary to all Philosophy, are ignorant, that there is a formal transmutation, while blood is made of meats; and while of blood a nourishable liquor is made.

And it is manifest from the aforesaid blindnesses, that the greatest part of diseases hath been committed upon trust, unto the ignorance of principles in the Schools. But I ingeniously protest, that I have never found even the least tittle of assisting aid in any books of

of Ancestours : For although many being as it were holpen, did recover ; nevertheless, I have seen ten-fold more, who from the beginning of the invasion of the plague, had made use of the same remedies, to have unhappily perished : For Triacle for a long time ago, hath always promised help, and the water thereof is now accounted every where more excellent, although they know, who have known the properties of the Pest, that they contain a vain help : For Antidotes which restrain poyson, have nothing of certainty against the plague : and therefore University-Physicians dare not expose themselves to the contagion of the plague, under the unfaithful safeguard of Triacle ; because the poyson of the Pest is a far secret one from any other. But some Religious persons in a City, leaving nothing unattempted, whereby they might obtain moneys, or esteem, profess to sell the most choice Triacle at a great price : But since none going to warfare in Christ, infolds himself in secular affairs ; I exhort every one chiefly to beware of such pompous Boasters : For why, they enter not in by the door, but above, by the roof ; being not called, they intrude themselves into medicine : For these will almost say with Tully, *We have deceived the people, and have seemed most famous Apothecaries* : For Triacle was as yet unknown unto Hippocrates, the subduer of the plague : It receiveth a three-fold quantity of honey, according to the plenty of all simples : Also sixty simples being at discord, being dry, hard, shut up, crude, excrementous, and for the most part inveterate from the age of two years : These Simples I say, are rendred much barren from the mixture of boiled honey : They require also a mixture and digestion from the feeble Feverish person, especially from the stomach being vitiated by poyson, and from the *Archeus* being inwardly prostrated, and confusedly tumulting : Wherefore they perform little of help, and the least of comfort : For the costed Trochies of the Viper, since by the admonition of *Galen*, they are the Capital Simple of Triacle, do easily teach, that the water of Triacle is plainly ridiculous : For if the Viper stated the Triacle water with virtue, in distilling ; why have the Trochies of the Viper, in its first and *Galenical* cocture, put off all that prerogative of healing ? What therefore shall I do with those who are always learning, and never coming unto the knowledge which they profess to teach ? For most men (as *Seneca* witnesseth) have not attained unto that Science ; because they thought that they had attained it. At length, neither hath it been sufficient to have concealed the names of those humours, which they have imagined to putrifie before the plague, and to be the accompanying cause hereof : But moreover, in skipping over that, they pass over the very thingliness of the corruption, which now and then, finisheth its Tragedy in a few hours.

For Physicians seem to have rested on a soft pillow, while their Neighbours house is on fire ; and their head being once elevated on their elbow, to have declared the Arrest :

The plague is a contagious disease, from putrified humours, being connexed to a Fever, most sharp, and exceeding dangerous : which being said, they having very well fed, to have bent down their head again for their afternoon sleep ; which sleep, under so great light, hath again closed their eyes. The world in the mean time, bewails its condition, seeing the effects, not the causes, as neither in the next place, the remedies to be noted by this judgement : Wherefore the Country people with both hands, scratching their hair on their Temples, pronounce another Arrest. *There is no need (say they) of much study, nor of so many books, that any may say, the Plague is mortal and contagious, the which, every one hath learned by his own malady : Therefore it shall be better to ask counsel of faithful helpers, no longer of drowsie ones, who are fugitives from the Plague, and ignorant of remedies.*

CHAP. VIII.

The Seat prepared.

IT is not sufficient to have demonstrated, that the causes of the Pest are unknown to the Schools, unless I shall declare my own experiences, the cause of the plague, its divers progresses in the making, its strange properties in its being made, its preservations, and cure. At first therefore, I will repeat what I have demonstrated elsewhere; to wit, that in Nature, there are at least two causes, and no more: Indeed the matter, and efficient; which efficient in the plague, I call the Archeus, Vulcan, or Seed: at leastwise, for the matter, there is not a certain undistinct hyle or matter, which never existed, nor will be in nature: and it serves for Science Mathematical, and not to a contemplator of Nature: Therefore, I behold the matter of the pestilence, with relation unto its internal efficient. The matter therefore of the plague, is a wild spirit tinged with a poyson: But that matter tends unto the end proposed to it self, after a three-fold manner; because it either comes to us from without, and being totally and perfectly pestiferous, exhaling from a pestilent sick person, or dead carcass, or place, or Utensile being defiled; or it is drawn inwards, being as yet crude, from a Gas of the earth putrified by continuance, which afterwards receives an appropriative ferment within; and at length, by degrees, attains a pestilent poyson in us: Or also a total destruction of us, is now and then materially, and formally finished within, without an external assistance. But that there are not more manners, whereby the plague is made, is manifest from the division: For either it is wholly generated within, without a forraign aid; or it happens on us from without; and that is either perfect in the matter, and form of a poyson, wanting only appropriation, and application; or it is as yet crude, imperfect, and as it were an Embryo. Whence at leastwise, first of all, it becomes easie to be seen, that the Pest doth not always first invade the heart: For I have seen him, who in touching pestilent papers, at that very moment felt a pain, as it were of a pricking Needle, and straightway he shewed a pestilent Carbuncle in his fore-finger; and after two daies died.

Furthermore, the aforesaid three-fold matter, however plainly venomous the first is; yet on both sides, it holds it self within the number of an antecedent cause: For no otherwise than as poyson taken in at the mouth, is not the disease it self, or death, but only the occasional cause thereof: For not any thing that is corporeal, aeth immediately on the life or vital powers (because they are those which are of the nature of Coelestial lights) but first it is received, and made as it were domestical: and when some poyson is now made a Citizen of our Inn, to wit, it being swallowed or attracted; notwithstanding also, it cannot as yet enter, or be admitted unto the hidden Seminaries of the vital powers (because it is in its whole essence external) but first, the poysonous quality, by acting on the life, stirs up the Archeus (otherwise the Author and workman of all other things to be done under his own government) into its own defence: For otherwise, a pestilent poyson aeth not like a sword, which equally wounds all it toucheth at, in the same moment of it self; but the pestilent poyson is not able to strike any. The Archeus therefore, since from his own disposition, he hath animal perturbations, passions, confusions, and interchangeable courses, he suddenly brings forth the image of his own alteration conceived, and decyphers that Idea in the particle or small portion of his own proper substance wherein it is conceived; which Image of Death being thus furnished, is the Pest or Plague it self. For truly, I do not judge the plague to be a certain naked quality, although it existeth not elsewhere than in a body, as it were accidents in a subject of inherency: but the plague is a Being, a poyson of Nature, subsisting by it self in us, and consisting of its own matter, form, and properties; the which I have elsewhere most fully demonstrated in the Treatise of Diseases.

But here it is sufficient to have admonished, that the life operates nothing by conquering, or destroying, unless by the vital motions of the sensitive Soul, which is not wont but to operate by Idea's on the Archeus the Executer of any motions whatsoever; even as, neither doth the Archeus operate after any other manner on the body. Wherefore, it is to be noted by the way, in this place, that the inward material and immediate cause of

of a disease, is the disease it self, no otherwise, than as the material cause in a man, is his very body, persevering from the seed even unto old age; but not that there is any conjoyned material cause of a man, besides his body it self, which is the very product of generation; to wit, from a material cause, and seminal internal efficient: which things have hitherto been veiled from the Schools, and so they have reputed the internal occasional causes of diseases, to be the immediate and conjoyned ones, being as yet plainly distinct from the disease produced: Wherefore that is also, next to be repeated in this place, which I have taught in my discourses of Natural Philosophy; to wit, that there are six digestions in us: For in the three former, that there are their own Retents, and their own excrements; the which, seeing every one of them are in themselves, and in their own Regions, troublefom; yea, by a co-infolding, and extravagancy, they have become hateful, they degenerate into things transmitted, and transchanged, and do from thence induce divers diseases occasionally.

But in the fourth and fifth digestion, I have shewn, that not any perceivable excrement is admitted: But in the sixth digestion, which is that of things transchanged, that very many voluntary dungs do through the error of the vegetative faculty, offer themselves. Moreover, that some are transmitted from some other place, as also that not a few do degenerate through a violent command of things suscepted or undergone: which things have been hitherto unknown by the Schools; and therefore also, have been neglected: and the which therefore, have wanted a proper name, and the disease effects of these have been ridiculously translated, and adjudged unto the four feigned humours of the Liver. Wherefore, although I as the first, have expelled the diseasifying causes of Tartar; yet lest I should seem to make new all things from animosity, I will here call these filths, the Tartar of the blood; although by an improper Etymology, because for want of a true name. Such excrements therefore, whether they are brought into the habit of the body from elsewhere: or next, made under transchanging, by a proper error of the faculties; or lastly, through a violent command of external things being there degenerated; I name them the Tartar of the blood: not that in very deed they are Tartars, in the matter and manner of the Tartar of Wine; but because of good nourishment being now defiled, that which before was fruitful and vital, hath afterwards become hostile.

And these things I have therefore fore-admonished of, that ye may know, that the Tartar of the blood is the product of the plague, and that that is easily made from efficient pestilential causes. And moreover, it is not yet sufficient to have said, that the Tartar of the blood, is the product of the Pest; but besides, I ought to prefix the place thereof: For I will by and by teach, that the Plague is a poyson of terrour; and therefore I have noted, that the Seat or primitive Nest thereof, is in the Hypochondrial or Midriffs; to wit, where the first conception of humane terrour is, whether it happen from external disturbances, or next, of its own accord, from the motions of things conceived: Wherefore there are present in the plague, vomiting, doatage, headach, &c. the which in its own place, I have decyphered in the Commonwealth of the Spleen. Therefore if the Schools had put this Tartar of the blood for a conjoyned cause, we had as yet notwithstanding, been differing from each other, as that which with them had been a connexed cause, is with me a product of the plague: for the Pest invades us after an irregular manner; neither is its conjoyned matter a certain solid body, or visible liquor, as neither therefore any putrefaction plainly to be seen; but only a Gas, separated and degenerated from the substance of the Archeus. But whatsoever visible thing offers it self as vitiated in the Plague, is not of the matter of the plague it self, nor of the matter [whereof] but it is either the occasional matter, of which before, or it is the product or off-spring wherein the plague sits, as it were in a nest. Wherefore the Carbuncle, Bubo, or Escharre, are not the original matter of the Pest, but the effect and product which the Pest hath prepared to it self: For the plague is for the most part so cruel and swift, that as soon as it is introduced into the Archeus, it cannot omit, but that it subjecteth some part of the nourishable humour unto its tyranny, and dwells therein: Wherefore, if the putrified humour should be the immediate cause of the plague, truly it had been putrified before it had putrified; To wit, seeing the Pest it self, prepares that vicious product for it self, which the Schools call humours, they being as yet undefined. For *Fernelius* would be a little more quick-sighted than the Schools; and therefore he knew that the plague was not bred, or did consist of the putrefaction of four feigned humours; as neither of the heat of the air, or of the cold thereof; but of a certain poyson, the Foster-child of hidden causes.

Again,

Again, we must take notice, that when the Tartar of the blood, or drops of the last digestion being vitiated, hath received a pestilent ferment, it hath a priviledge of exhaling through the pores, no less than other transchanged excrements, without any residue left behind it, or remaining dead-head (So the Chymists call the dreg which remains after distillation) to wit, if the humours shall be alimentary; but not, if the substance it self of the solid parts be scorched into an Escharre, or Carbuncle: for so the much more hard dungs of the *Lues Veneræ*, being as it were equal to bones, the counsel of resolving being snatched to them, do wholly vanish.

But although the Tartar of the blood, doth also rejoyce in the aforesaid prerogative, as oft as it is banished as infamous, out of the family-administration of life; yet while it is transchanged into a corrupt matter, or thin sanious poyson, it gnaws the skin into the shape of an Escharre, before that it can sweat thorow the pores in manner of a vapour: And that indeed, by reason of the imprinted blemish of a strange ferment, whereby it degenerated into a formal transmutation: But if indeed, the Tartar of the blood shall draw the odour of the ferment, but is not yet transchanged, Glandules, Buboës, &c. are made, which are oftentimes ended by a plentiful Flux of sweat, without opening of the skin: whereas the other aforesaid products cannot obtain that: and almost all these, are by the Schools banished into Catarrhs. The whole Tartar of the blood therefore, is indeed bred at home; but it is a Bastard, which is intruded by force, destruction, and error.

But since the remedies of Nature are subject unto so many Courts of digestions, and bodies of so eminent an excellency, do possess a violence and strength of acting, and likewise have filths admixed with them, or difficult bolts; truly, the art of the fire is never sufficiently esteemed, which now and then graduates one Simple to that height, that it persecutes with revenge all the excrementitious filths of the digestions, even into the uttermost coasts of the body: otherwise, in the last digestion, very many griefs do offer themselves, they being referred by the Schools, among incurable ones, by reason of one only fault of a remedy alone, which accompanies, and accuseth the defect; no otherwise than as they are destitute of curing, in the work of witches, because remedies are neglected, which may go into the root of the malady: For truly, those devilish discommodities do not lay hold so much on the body, or the filths thereof, as on the *Archeus* himself; the which, since he is as it were the clear image of the man, it follows, that while that Spirit is wrested aside in any Organ of its body, the same member suffers the symptoms of the *Archeus*: And so, whatsoever the Spirit suffers, which is the Ruler of life and sense, it must needs be, that the body suffers; but not on the contrary: For neither doth he that is maimed in one leg, therefore generate a maimed off-spring, because the spirit is not defectuous: For whatsoever the body suffers, although the Spirit feels this same thing; yet this is not drawn together, unless the passion incline unto extremity; that is, that it is co-fermented within the root of life, or implanted spirit; even as I have elsewhere shewn concerning the convulsion in the Colick. Its no wonder therefore, if a Tartar of the blood be stirred up by the state, or insisting urgency of the *Archeus*: For who is he that knows not, that indignation, confusion, a sorrowful message, affrightful fear, &c. do presently take away an appetite of eating, do stir up sighs, or tears, and extend an unwonted fardle under the Midriffs; to wit, as the nourishment of the sixth digestion degenerates in the stomach, namely, where such passions are immediately framed. This Tartar of the blood therefore, being once become degenerate, doth presently molest in manner of an Enemy. And even as a dog being once mad, pays the punishment of his madness with his own death; So that Tartar being once banished, and referred into the number of excrementitious filths, doth never afterwards return into favour; because, whatsoever the *Archeus* once forsaketh, straightway dieth, and that which is dead doth no more revive, nor strike a peace with the Enemy: Therefore an earnest desire of revenge, and indignation of self-love, are radically co-bred in the first Fountain of Nature: They do also more manifestly rise up in the more perfect subject, and so in sensitive creatures, do challenge to themselves the animosity and glory of a wrathful power. Wherefore that Tartar of the blood, being subdued by the plague, doth no longer obey the Laws of Life, but repenting of its former obedience, arrogates to it self an unbridled liberty of fury, and by so much the more cruelly molesteth us, by how much the more confidently it hath once received the hidden counsels of the *Archeus* within; which thing, the Schools name, to symbolize or co-resemble: For then it is an household-Thief, unto which the ways to the treasure, and privy store-houses are known: For how speedily do a few drops of corrupt matter under the scull, kill? and what cruelty doth

doth not the blood chased out of the veins, threaten? how cruel, is even but one only thorn in an Aposteme? Its no wonder therefore, that the Pest, the most fierce of diseases, doth presently bring forth its own product, and if it shall not find a seat, that it presently makes one for it self: notwithstanding, a hope of curing the plague remaineth, because that Tartar, and the Pest its own Inn, may be put away or dissolved by a due banishment of sweat: The which understand thou, as long as it shall remain in the shape of dissolvable Tartar: For otherwise, if it shall catch hold of a solid part, the hope of life fails, unless the part it self which is caught hold of can forthwith be sequestred: But Wheals, black streaks, or black and blew spots or tokens, denote the Archeus to be affected; for they are the superficial tinctures of the skin, the which, if they shall the more deeply lay hold of, they do also cauterize it: and since they do immediately pierce the Archeus before others, they stand in need of a most speedy remedy.

It is also worthy to be noted, that an unsensible transpiration in the plague, differs from sweat; because Diaphoresis or unsensible transpiration is the matter of the nourishment, and so also of the Tartar of the blood, being defiled; but sweat is of the substance of the Latex: But transpiration, seeing it is continual, it is also without sweat. Hence it comes to pass, that sweat doth most especially wash off, and for that cause, a dry transpiration is seldom sufficient for curing of the plague: and therefore a plentiful rinsing sweat is to be provoked; that while the Pestilent Tartar breatheth the naughtiness of its poyson thorow the pores, it may be partly washed off by the sweat, and the delay of its departure be partly speedied. Here a difficulty is manifest to be noted, and not decided by the Schools; to wit, why some defects of the stomach are cured not by vomiting, or stool, but only by sweat; because they consist in the Retents of the stomach being transchanged in the sixth digestion, but not in the remainders of the Cream. The Plague therefore, for the most part begins in the stomach, and there begets and infects the Tartar, whereon, as soon as the perturbations of the Archeus have made their assaults: For every imagination of the desirable faculty hath its seat in the same place, and there frames its Idea; and chiefly, about the orifice of the stomach, the vital powers are concealed, as I have elsewhere many times professedly demonstrated. But because the Tartar of the blood is in the form of a mucky sliminess; Hence the Idea of the Pest willingly buds forth into Glandules: for the stomach, and the Archeus thereof, because it sends a continual society of imagining into the brain; hence are Parotides or tumors behind the ears: But it pierceth thorow the Diaphragma into the lungs, and arm-pits, and a perplexity of breathing doth arise. But pestiferous odours being prepared in the stomach, frequent vomitings do accompany them, together with a pain in the head, the which, we having often experienced from the odours of burning coals, to have vomited with headach, and a dejected appetite: But if they proceed unto the Liver; Now there is a Bubo in the groyn.

CHAP. IX.

Minerals and herbs do imagine after their own irregular manner.

WHatsoever subsisteth by a real essence, doth after some sort love it self: Wherefore also, it hath the sense of a friend, or enemies; that is, of its own commodities, and troubles: wherefore, a self-love resteth in the bosome of Nature: But things do scarce ever remain in the same state, without interchange: Therefore they undergo somewhat: but if they suffer, and walk in the way of destruction, verily it must needs be, that they have a cause from whence they are grieved: Wherefore, sympathy and antipathy are observed to be even in stones; but in the Load-stone, most manifestly; the which notwithstanding cannot consist without a sense or feeling: But wheresoever that sense is, although it be dull, it happens also, that some shew of imagination agreeable to its subject, doth accompany it: For otherwise, it is altogether impossible for any thing to love, desire, attract, and apply that which is consonant to it self, or to shun any thing adverse to it self, unless a certain sense, knowledge, desire of, and averfeness from the object are reciprocally present.

All which things do enclose in them an obscure act of feeling, imagination, and certain

certain image of choice: For else, by what means shall a thing be moved, or altered at the presence of its object, unlesse it feel or percieve that very object to be present with it self: If it percieve, how shall it be altered, except under a conception of the passion felt by it self? And unlesse that felt conception doth include some certain imagination in it self? Take notice Reader, that in this corner, all the abstruse knowledge of occult or hidden properties layeth, which the Schools have banished from their diligent search: they desisting from whence they were to begin, according to that Maxim; *A Philosopher must begin where nature ends*: I have therefore deliberated more exactly to demonstrate, that in inanimate things there inhabiteth a kind of sense, phantasie, yea, and of choice, yet in a proportionable respect, according to the capacity and degree of every one.

I do not in the mean time make mention of Zoophytes or Plant-Animals, which remote absence of proving, might unto many seem to be ridiculous: But our paradox will offend none who moderately understands it.

First of all, it is not to be doubted, but that some flowers do accompany the Sun, as well in cleer days, in those wherein the Sun doth not shine, as in nights themselves; they attesting that they have a motion, sense, and love of the Sun: because, without which it is impossible for them to accompany the hidden Sun. For even as late in the evening they loose the Sun in the West (the which, while he hastens towards the East, doth not operate amongst us who abide in the shadow of the earth) yet in the mean time, whether the night be hot, be cold, be cleer, or rainy, the flowers notwithstanding do not cease equally to bend themselves towards the east: Which thing first of all, poynts out that there is in them a knowledge of the rising, and circuite of the Sun, in what part he is to set, and in what to rise; call thou it the instinct of nature, or as it listeth thee: For names will not change the matter: the matter it self is of a deed done, but the deed hath its cause in the flower: But that these things do thus happen in plants vegetatively enlivened, it is the lesse wonder: But that they have place also in Minerals, I thus prove: There is almost nothing made in nature, without a proper motion: and nothing is moved voluntarily or by it self, but by reason of the property put into it by the Creator, which property, the Antients name a proper love, and for this cause they will have self-love to be the first born daughter of nature, given unto it, and bred in it for its own preservation: And when this is present, there is of necessity, also a Sympathy, and Antipathy, in respect of the diversity of objects: For so the feathers of other birds are said to undergo rottenesse by the feathers or wings of an Eagle: and cloath made of the wools of sheep that died of their own accord, is soon of its own accord, in the holes which are beaten thorow it, resolved as it were with rottenesse, in what places the threds of the dead wool run down: So a drum made of a sheep and asses skin, is dumb, if a neighbouring drum made of the hide of a wolf, be beaten.

The skin of a Gulo (it is a most devouring creature in *Swethland*) stirs up in a man, however sober he be, and not a hunter, the ordinary sleeps from hunting and eating: if the party sleeping be covered with the same. But what are these things to minerals? Truly I proceed from the vegetable kingdom, through dead things, by degrees, unto stones, whereunto the holy Scriptures attribute great virtue: For indeed, stones could neither move, nor alter, if they had not an act of feeling of their own object: For neither could red Coral wax pale, if being born about, it shall touch the flesh of a menstruous woman, unlesse it self felt the defects thereof: For the Load-stone bewrays it self, as the most manifest of stones, which by a proper local motion inclines it self to the North, as if it were vital: But not that it is drawn by the north: Because if a Load-stone be placed toward the north in a wooden box, in the averse part of it, upon the face of a standing pool of water, the box, with the other and opposite corner of the stone, speedily as may be, rowls it self to the North: Therefore, if that should be done, by a drawing of the north, and not by a voluntary impulsive motion of the Load-stone it self; the box should in like manner, presently also, by the same attraction, yield it self unto the north bank: The which notwithstanding, comes not to passe: but the box, together with its stone, remains unmoved, after that the stone together with the box, hath retorted it self on the requisite side, and by a requisite motion. It is clear therefore, that the Load-stone doth of its own free accord, rowl it self to the North: From whence afterwards it followes, that there is in it a sense, knowledge, and desire unto the north, and also the beginning of a conformable motion.

Furthermore, if any one doth hold a polished piece of steel nigh the aforesaid box, toward the South-side, the Load-stone then forthwith neglects the north, and turns it self to the steel; so that the box not only turns it self to the steel, but that it wholly
also,

Also, swims toward the north: whence also it is plain to be seen, that the Load-stone is carried with a stronger appetite to the iron, than to the North; and that the steel hath lesse of a successive alteration in it, than the North: Consequently also it is manifest, that it is strong in a manifest choice of objects. Some have moved a frivolous doubt about this matter; To wit, whether the Load-stone draws the iron, or indeed the iron drawes the Load-stone it self? As not knowing that there is a mutual attraction on both sides; which comes not by little and little, by reason of much familiarity, neither doth it keep respects, nor observe the ends of its own gain, fruition, circumstances, or consequence:

Neither is that drawing subject to a flatterer, or defamer: but it is a gift originally inbred by nature, in the Archeusses on either part, and marked with a proprietary character by him who made all things; so that indeed, if the steel be lighter than the Load-stone, it is drawn to the Load-stone; but otherwise, if the stone be lighter than the steel: Because the drawing is not in the one, and the obedience of the drawing in the other; but there is one only mutual inclinative drawing, and not of the drawer with a skirmishing of the resister. And so, from hence it is manifest, that a desire is in nature before the drawing, and that the drawing follows the desire as some latter thing, as the effect doth its cause. If therefore, according to the testimony of truth, all things are to be discerned by their works, and the fruits do bewray their own tree; truly such attractive inclinations cannot subsist without the testimony of a certain co-participated life, sensation, knowledge, and election.

Moreover, neither is the life of minerals lesse than the life of vegetables, distinguished from the animal life, by their own life, and their generations among themselves: Because that which is vegetable, and that which is mineral, do not operate but one, or a few proper things; and the same things as yet, with a preciseness, interchangeable course, property, inclination, and necessity, as oft as a proper object is present with them: but a living creature operates many things, and those neither constrainedly, as neither by accident of the object; but altogether by desire, well pleasing, appetite, will, and choice of some certain deliberation; Seeing the first operation of the same is life; but the second, a proper appetite, desire or love, or delight. At length, thirdly, there is a deliberative and distinct choice of objects: So I have seen a Bull that was filled with lust, to have despised an old Cow; but an heifer being offered him, to have again presently after, wantonized.

But the first operation of things obscurely living, is a power unto a seminal essentialness.

Next, the second, is an exercise of powers, and properties.

At length, the third operation, is a greater, and lesse inclination, motion, and knowledge: The which indeed, flow not from a deliberative election or choice; but from a potestative interchangeable course, strangeness, likeness, appropriation, purity, or unaptness of objects: wherefore it was a right opinion of the Antients, that all things are in all after the manner of the receiver: But those powers by reason of their undiscerned obscurity, and the sloath of diligent searchers, have been scarce believed; but by predecessors, and moderns, were not considered: and by reason of the difficulties of access, they have circumvented the world with a wandering despair, and with the name of occult properties have hood-winked themselves by their own sluggishness: But my scope in this place hath been; that if in Herbs and Minerals, there are such kind of notions, the Authoresses and moderatresses of hidden properties, the same, by a far more potent reason, and after a more plentiful manner do inhabit in flesh and blood; To wit, excellently, with a particular and affected notion, motion, inclination, appetite, love, interchangeable course, hostility and resistance; as with that which occurs in us through the service of the five senses: Even so that in flesh and blood, there is a certain seminal notion, distinction, imagination, of love, conveniency, likeness, and also of fear, terror, sorrow, resistance, &c. with a beholding of gain, and losse, offence, and complacency, of superiority I say, and inferiority, and so of the agent, and the patient.

Because those necessary dependances of a consequent necessity, do flow from, and accompany the foresaid sensations or acts of feeling: The which surely in the vital blood are characterized in a higher degree, by reason of the inbred Archeus the Author and workman of any of these passions whatsoever, than otherwise, in the whole kind that is not soulished or quickned: For a tooth from a dead carcase, that dyed by the extinguishment of its powers, constraineth any tooth of a living man to wither and fall out, only

by its touching, because it compels it to be despised by the life : The which, a rooth from a dead carcase slain by a violent death, or presently extinguished by a sharp disease, doth not likewise perform. In like manner, the hair of a dead carcase whose life was taken away by degrees, by a voluntary death, makes persons bauld only by its touching : Warts, and brands brought on the Young by the perturbation of a woman great with child, through the touching of a dead carcase that died of its own accord, and by degrees, untill part of the branded mark shall wax more inwardly cold; the mark also doth by degrees, voluntarily vanish away. Observe well with me, whether these are not the testimonies of another act of feeling than that of cold.

Moreover, whether in that same sensation, there be not a natural knowledge, and fear of death connexed, which things are as yet also in the dead carcase: For truly a *Tetanus* or straight extension of a dead carcase, or stiffnesse thereof, is not a certain congelation of cold; But a mear convulsion of the muscles, abhorring death, and living even after the departure of the soul : For from hence the dead carcases of those who die by a violent death, because they die, the faculties of their flesh being not altogether extinguished, they feel not the aforesaid *Tetanus* but a good while after.

CHAP. X.

A living creature imaginative.

I Have said that Herbs and Minerals do imagine by a certain instinct of nature, that is, after their own manner : so in the next place, that the blood and mummie have certain native conceptions, in order, and likenesse unto man : which things, that they may be directed unto our purpose concerning the Plague; thou mayest remember, after what fort the perturbations of a woman great with child, her hand being applied unto some certain member, although unadvisedly, rashly, and without a concurrence of the will, do decipher the member in the Young co-agreeing in co-touching, with the image of the object of that perturbation : with the image I say, but not with an idle signature. But suppose thou that her desire was to a cherry; verily a cherry is deciphered in the young, and in a co-like member, such as the child-bearing woman shall touch with her hand, which cherry waxeth green, yellow, and red every year, at the same stations wherein the cherries of a tree do attain those interchanges of colours : And which is far more wonderful, it hath happened that the Young so marked, hath suffered these signatures of colours in the Low-countries; in [the moneths called] *May* and *June*; which afterwards expressed the same in *Spain*, in [those called] *March* and *April*. And at length the Young returning into his countrie, shewed them again in a bravery, in [those called] *May* and *June* : Also under a strong impression of a woman great with child, not onely a new generation of a cherry is brought in thereupon; but it also happens that the old one is to be changed, and it constrains a seminal generation to give place; yea, and the image of God being now lively or in the readinesse its coming, not to come, and that a strange-born creature and monster is substituted in its place : Of the contingencies whereof, daily, and involuntary experiences are full : which power is granted to be given to a woman great with child : yet not that therefore in other women, the images of concepts are not likewise brought unto the womb wherein an embryo doth not inhabite : For I have taught in a particular treatise, that the disturbances of men are framed in the midriffs, about the mouth of the stomach, to wit, that in men, they from thence ascend unto the heart; but in a woman that they are more readily sent unto the womb : because a woman doth naturally appoint vital inspirations for her Young : And so, every commotion of the midriffs in a woman, hath continually respect unto the womb, whether a Young be present or not. Whosoever therefore much disturbs a woman with grief, &c. from a deliberate minde : he willingly sends into her, a disease : And he that molests a woman great with young, let him know that he hurts the mother, and off-spring : Hence maides, about the years of maturity, if they are vexed with the concepts of difficulties, they are wont continually to decypher the sides of their womb with the vain Idea's of conceptions, and for the most part they are made unto themselves

themselves the Authoresses of various sumptoms, for inordinate lusting: Because the womb doth not suffer its tranquillity to be taken away by forreign images, without punishment. But a man formes his images in his midrifts, as well those of the desirable, as of the wrothful faculty, so that madnesse is therefore not undeservedly called, hypochondriacal; and that thing happens no otherwise than as in a woman: but he transmits the Idea's of concepts, more freely unto the heart, and brain: For a certain man expecting that on the morrow morning, a Major would be sent for his household goods, sitting sorrowful all the night with his head leaned on the palm of his hand, in the morning had that side of his head grey, in what part his temples had touched his hand: And to the hand of a woman with child translates her own exorbitances unto her womb, and the hand of a man his feares, even into the skin of his head.

At leastwise, from hence it is manifest that there is a true growth and nourishment of the haire, and not a vain signature of colours; but that they are not in-bred by an application expelling from behind: and then, that the perturbation in men, is much akin to that of a woman, although far more infirme. I have taught also elsewhere, that the efficacy of disturbances consisteth in the spleen: Wherefore antiquity hath accounted *Saturn* the principle and parent of the starry gods, also the highest of the wandering stars, to wit, the which should cast his influence downwards on the rest, but that the rest should in no wise reflect upwards, because the stars are believed to conspire for the commodities of sublunary things, but not upwards: Therefore they called *Saturn* the origina of life, and the beginning of conceptions, or generations; yea and they named him the devourer of a young child; poynting out hereby, that the images framed by the desirable faculty, do make seeds fruitful, and also the Inns of digestions in us; even as when they are exorbitant they consume the new or tender blood, and enforce very many diseases on us.

Therefore the imagination of the spleen hath the first violent assaults, which are granted not to be in our power: *Saturn* therefore was feigned to be as it were without a beginning: but *Jupiter* the chief off-spring thereof, casting down his father from his seat, signified the brightnesse of reason subduing the first assault of imagination: But an image formed by imagination, is presently in the spleen, clothed with the vital spirit, and assumeth it, whence an Idea is fortified for the execution of works: for what person is he who hath not sometimes felt disturbances, anguishes, and the occasions of sighing about the orifice of his stomach, in which part the spleen is most sensitive, even as also the touching in the fingers ends? Is not the appetite taken away from an hungry man, by a sorrowful message? Be it observeable in this place, that although the essential disposition of things apprehended in time of the perturbation, be plainly unknown unto the woman with child, yet she wholly formeth and figureth the same in her young, while as without the trunk of the trees, she frameth a cherry in the flesh, in an instant, containing the internal essence, and the knowledges of a feminal cherry. Its no wonder therefore, if that a terrour from the plague, frameth an Idea of the plague, from whence the plague it self doth presently bud, although the sensitive soul of man be ignorant of the essence of the plague.

Heer an open field is made manifest, to prove that the knowledges or Idea's of all things, are formed in us by the power of the sensitive soul; yet that they lay obscured in the immortal mind, which we believe to have been present with *Adam*, while as he put right names on the bruit beasts: For if the concept of a woman being allured by the overflowing of some certain perturbation, can decypher the inward dispositions of plants, or animals (yea sometimes, with a total transmutation of her young) it must needs be, that in the mind it self, as in the essential engravement of the divine image, an essential notion at least of sublunary things doth inhabite, only being depressed and deformed in the impurity of nature, and spot of original sin: otherwise, the sensitive soul cannot do strange things which it knows not, and hath not; and so there is need for the immortal mind to have a conflux hereunto, it being stirred up by perturbations: It is a very obscure and difficult way, whereby Adeptists, by no help of books, do strive by seeking to obtain some former light of sciences: And therefore also, they call it the labour of wisdom: and *Paracelsus* esteems it to be ten-fold easier than to have learned Grammer:

Yet *Picus* is of opinion, that unlesse the operator makes use of a mean, he will soon die of a *Binsica*, or drynesse of the brain: That the spirit of life will be diminished by reason of a daily continuance of speculations. Whatsoever that may be, at leastwise, the ignorance of causes hath neglected most things, and the helpings of the

the sick have been expected in vain. But I have discussed in this place of images or likenesses bred in the imagination, whereby it may be manifest, after what manner every corporeal body proceeds from an invisible and incorporeal Beginning (the which, they of old affirmed to be fetcht from the intelligible world) by the imagination of the foregoing parent, in imitating after a certain similitude, the creation of the world, being from the command of the incomprehensible word, [*Fiat*] once made of the infiniteness of a nothing: The which afterwards, obtained its continuation from the gift of the word; Let seeds be brought forth; To wit, by a fore deduced imagination as well of plants, as of animals: Nature therefore, in following the power infused into her, brings forth every seed by the image of a certain conception. There is indeed, as well in living creatures, as in plants, yea and in minerals themselves, every one their own imagination, after their own improper manner; yet on both sides the productresse of the fruitfullnesse of seeds, as well for a natural Being, as for that of super-incidents and monstrous ones:

Because the imagination frames an image of the thing conceived, which by its gifts given it of God, it converts into a Mean, which is called a seed; To wit, without which image, every seed is only an empty husk: No otherwise, than as the blossom of a pippin, not having a promised pippin behind it, is a vain braggery: That image, and seminal one, even as it beats in it self a perfect similitude of its own image to be conceived; so also, a free and uncorrupted knowledg of things to be done by it self under the race of generation: Yet this is remarkable in generations; that as a woman with Child doth not operate the wonders proposed, unlesse she be fore smitten with perturbations, and the flint be struck against the steel; so the seeds of living creatures cease to be fruitful, unlesse a disturbance of lust be conjoynd, making the soul to descend into the seed, that it may enlighten that seed: Wherefore herbs languish presently after their product, the scope of their imagination or property being compleated: But minerals, because they are not ordained to stir up a race out of their own bodies, by so much also they have the ends of their own imagination far more obscure.

Since therefore, all generation presupposeth an image, according to which it executes its own dispositions: Hence it cannot come to passe, that an imagination of terrour should generate an Idea of love, nor that a phantasy of fear from an enemy, should produce a phantise of terrour from the plague. Also places infected with the Pest, are not undeservedly to be avoided; and not only by reason of the air being already vitiated and defiled; but also, that objects may be avoyded, which conduce unto the imagination of terrour. Now the shoare whither we fall appears afar off, and after what sort terrour may be the Father of the plague. It also happens that children do most speedily imagine, and are disturbed; yet their perturbations do not carry seeds in their images; or cause the plague unto themselves by terror: For it is with these even so as with a young musician, who in his first lessons, doth not transmit his cogitation conceived unto his fingers, but with difficulty: But after that he is skilful in his art, and fingers are now accustomed unto the images of tunes, and motions; they undoubtfully perform the command of the phantise, and perfectly sound out the whole hymn, although now and then, through an attentive discourse, he shall divert his minde from the musick: For neither do his fingers cease to proceed unto the end of the well apprehended song.

CHAP. XI.

Things requisite for the Idea of an imagined Plague.

Experience hath oft-times caused a belief, that some one hath prepared the absent Plague in himself and his, through terrour alone : which truth sheweth, that the image of the phantasie, doth from the incorporeal essence of its own nakednesse and simplicity of cogitation, cloath it self by little and little, and put on the Spirit of Life, and leaves therein its own seminal product : a Being surely, most ready for great and terrible enterprizes. But moreover, that it is not yet sufficient for the execution of its appointment (for it is found, that the Image arriving at the Bowels, doth nevertheless oft-times wax feeble) Therefore, I have declared, that in a Woman great with Child, the hand is moreover required, it being the Instrument of Instruments, as an external Instrument and sign of the determined member whereon the Image is to be engraven : For the Soul alwayes useth meanes, upon which the Image is carried, for Being and Operation. But I therefore ought to delineate after what manner the Soul after the example of a Musitian dismisseth the operative Images of its own conceptions unto the hand, but in no wise unto the foot : and after what sort, through custom, that presently transmitteth its Images, which otherwise, besides custom, would most troublesomly reach thither. Wherefore it is to be noted, that if the Woman with Child shall be right-handed, and yet shall, under the onser of disturbance, touch some one of her members with her left-hand, nothing will be marked upon her Young thereby : Whence it appeareth, that that hand, which is the common ordinary and daily executress of cogitations, is also the Directress of Images unto places, and operations. Therefore a man doth not operate alike strongly by imagination, as doth a Woman : nor any other Woman alike strongly, as doth a Woman with Child : neither also doth every terrour generate the Plague : For the affrightment by a Wolf, Snake, or mad Dog, doth not produce in us the operative Images of a Wolfe, or Snake ; yea, nor indeed, where the Wolfe is visibly present : even as notwithstanding, the Plague is bred in us by an Image of terrour. A doubt therefore subsisteth, whether an affrightful imagination of the Soul from the Plague, or the Image thereof, be a sufficient and suitable cause of the Plague ? First of all, it is seriously to be heeded, that the imagination is sufficient of it self for to operate, unlesse other things beside do concur. For first of all, wholly in ordinary and accustomed works proceeding from a deliberation of the elective Soul, the will must needs be present : For a Baker shall vainly, and that intently imagine many things about making of Bread, unless his will shall move his hand, not indeed to some member, but unto the Dough. I in like manner, writing of the Plague without terrour, in a full will, and concept of the thinking Soul, do meditate many things concerning the Plague ; Yet I do not therefore contract this Plague to my self. No man also, unlesse happily he be foolishly desperate, intends a generating of the Pestilence in the consent of his will. An unfolded will therefore, is required, in a daily and natural course of operative actions, wherein the will draws forth conceived Images in deliberating, for the execution of the work : But there is in no wise required a consent of the will, for the generation of a Being, or the transmutation of one Being into another : For truly, every transmutation, although it be monstrous, yet it attempts the priviledges of a true Generation ; Since there is a re-ideating in the Archeus, from the Victory of the new Image, translated upon the seminal one, which was first conceived in the Archeus. Therefore the consideration of transmutation doth not consider a consent of the will. Again, neither a naked imagination, or production of an Image, nor a touch of the hands, do suffice together for transchanging : But (mark well) every work of imagination, which of necessity produceth in us a new generation, or transmutation of one thing into another, requireth the concurrence of a certain faith, co-bound in the same point of the Subject, the phantasie it self : For truly, an affrightment from a hurtful Animal, doth not produce in us that hurtful Animal, nor even the poyson thereof ; Even so also, as my attentive imagination, meditating of the wonderful poyson of the Plague, doth not therefore generate the Plague in me. The reason therefore, why a terrour from the Plague, doth rather cause the Plague, than a terrour from living Creatures, causeth the poyson of the same ; consisteth in this ; that the poyson of the Pest is made not only from an apprehension, and concept of terrible effects ; but because there concurrerth together with those, a certain unseperable belief whereby any one being affrighted, and sore afraid, in fearing, doth imagine, and slenderly believe that he hath now contracted something of the pestilential

tial poyson: From whence (but not before) the Image of the Plague being conceived by this kind of terrour, becomes operative and fruitful. For that terrour, with a credulous suspicion, applyeth the Soul thus affrighted, unto the *Archens*, that it may cloath this *Archens* with the Image of the conceived Terrour: Through want also of which Belief, although Animals should conceive great terrour, yet they never snatch to them the humane Pestilence, although they sometimes draw in their own consumption, as also natural poyson, from whence also they dye. For it is a fermental poyson, the which, how speedily soever it may dispatch them; yet it is not the true Plague. But whosoever shall see a mad Dog leaping on him, and how much soever affrighted he shall be from thence; yea, though he conceive a Fever and dye; yet no man doth ever even slenderly believe that he drew the poyson of the mad Dog, without biting: Wherefore also, all his fore-fear is onely least he should be bitten; which rather includes a prevention of a poyson to come, than a belief of a poyson bred. The terrour therefore, the occasion of the plague, carries a certain belief and fear in the Imagination, that he hath actually drawn something of contagion vnder such an uncertainty and Agony: Because the poyson of the Plague is onely visible, but not the biting of a mad Dog: which particle of faith, together with the disturbance of Terrour, perfecteth an actual Image in the *Archens*, the seed of the Plague that is to be generated: Because that which is imagined, apprehended with perturbation, and believed, doth stand actually in the same point of the phantase, which brings forth an Image on the *Archens*, as it were a seminal Being. Otherwise also, neither is any faith sufficient for this thing; because, there is none who doth not firmly believe the Plague can kill, infect, happen unto one, &c. But such a belief as that, is feeble, and as it were dead; neither therefore is it operative, that is, not hurtful; unlesse that in the same point of Identity, it be essentially connexed unto terrour apprehended with disturbance, from a drawing in of the actual poyson. For Camps and Castles do very often snatch to them a panick fear and deadly terrour, as soon as with the fear of perturbations, they believe that the Enemy hath treacherously, or privily crept in, or obtained an unexpected aid, &c. All which things do rather prevail under a dark night, wherein all things are made invisible, and more horrid and fearful. Pollutions in Dreams, although they have a strong Imagination without the motion or enticements of fornications, which is sufficient for expulsion; yet for want of that belief, they cast forth onely barren seeds: For although the Imagination operates in sleeping; yet a Faith or Belief doth not operate in Dreaming; because it is that which is not the Daughter of the Imagination, but of the will alone: For indeed, sleep peculiarly conduceth to this, that the liquor of nourishment being transchanged by the application and information of the mind, may be altogether assimilated: wherefore, in youthfull yeares, people sleep more, and more soundly than in those succeeding. And since vital matters have their own natural Imaginations, even those which are not intellectual Imaginations; Surely, the Imagination of the blood it self, shall most powerfully operate under sleep. But Faith or Belief, seeing it is a separated power fast tyed to the Soul and Will, it is of necessity also stupified in time of sleep. There is therefore, well nigh, an unshaken and incessant act of the Imagination of the Spleen: But the Soul once believing some one thing, afterwards ceaseth and is at rest from the consideration of believing or confiding, untill that an Object be again rub'd on it anew. Neither do I speak in this place concerning *Christian faith*, and a supernatural Gift of God; but I behold a confidence, to wit, as well as delusion in believing, as the supposing of a true thing. For a certain young Bitch, and not yet lascivious, having gotten a whelp of fifteen dayes old, licks it, loves it, and puts it to her dugs; and then being befooled, believed that it was her own Young; who was a yet uncorrupted, her dugs presently swell, and I saw them to have poured forth plenty of milk. Also, if thou desirest Chicken in the midst of *Winter*, make the Eggs lukewarm with a hot Towel, and in the mean time unfeather the breast of a Capon, put him upon the Eggs that he may cherish them, and there shut him up: who in rising up, feeling the lukewarmth of the Eggs, and the unwonted coldnesse of his breast, begins to cherish the Eggs: But in sitting on them, he conceiveth a false belief, and believes that he is the mother of the Eggs, he brings forth all the Chickens, even unto the last, and calls them together by Clucking like a cherishing Hen, and fighting for the Chickens; chafeth the Cock; and at length being forsaken by the Chicken, is very sorrowful. If therefore a false belief operates so much; what shall not any the more grounded one do, that is conjoynd with the terrour of the Plague. There is therefore, a certain native Imagination in the blood, in the parts of an Animal; yea and in the disease excrements; so that, magnetical or attractive Remedies have already begun with benefit to be applied unto

unto the blood let out of the veins. Let us consider also, the excrementitious muscilage of the sixth digestion to stick fast within the Reeds or Pipes (I thus by one onely Etymology, call the Veines, Arteries, Bowels, and any kind of Channels) to be at first in its owne quality, guiltlesse, but violating the right of its Inne, as it is undirectly a stranger; And therefore by it self, laying in wait for the part. Presently after, a desire of expelling that excrementitious muscilage, is conceived by the *Archeus* implanted in the part: the Idea of which conception, is imprinted on the hated muscilage; The which, seeing it is seminal, it obtains a form, being a certain life; and likewise from hence also, a power of acting, and afterwards it governs its own matter for the Ends proposed and obtained by it self. But the member not being able to subdue the guest, connexed unto it against its will, burns with a greater endeavour and appetite of expelling; For, neither is that desire any longer a Being of Reason, or imagined Being; but it hath arisen into a certain seminal Being, by reason of the Idea conceived by the *Archeus* being imprinted on himself, and it transforms the forreign matter into every perfection of a disease Seed: no otherwise than as in the spittle of a mad Dog, there is a seminal madnesse it self: and the concept of a Woman great with child, in the deciphered cherry of her young. For so the matter being enriched with a power of acting, according to the Image of the passion put on, begins to act on the entertaining member. There is indeed now in it, a disease it self, having obtained an efficient Seed; the which, at length, being more stubbornly connexed, and oftentimes the Conqueror, subdues the vital faculty of that member, into its own jurisdiction. To wit, it mortifies, and renders the part wherein it sits, conformable unto its own contagion. But the part, seeing it is subject unto wearinesse, and the bound hereof: but on the contrary, the Character or Seminal Idea now conceived, is unwearied; it must needs be, that the forces of the *Archeus*, being as it were collected, that disease is banished by a Crisis, or the strength of the disease being voluntarily worn out, that it be deprived of the power of acting, and that stoppages and *Schirrhus's* are made: or that being overcome, it be driven from the place, and an Imposthume be made: or that it be expelled by the strong prevailing force of a Medicine. For otherwise, Nature forsaking the Raines, delivers its hands bound to the disease. To wit, as the part containing, being conquered by the Enemy contained, makes all the rest like unto its self, no otherwise, than as a small Gangrene soon mortifies the whole Body: So also, the matter of a disease sticking fast and infecting the part whereto it adheres, presently infects the whole intire Body. For, neither are the Seeds of a disease matter alwayes inbred from the beginning: the which therefore, in the mean time, is onely the occasional matter. And moreover, for the most part, a foolish and unhurtful race of qualities do dissemble the innocency of a disease Thorn. Otherwise, hurtful things should never be admitted within, because they are wont before their admission, to be intimately and finely examined by the *Archeus*. For, whatsoever things are incapable of the necessity of life, are presently prostrated in their entrance. If therefore excrementitious filths being inwardly admitted through a treacherous error, or having arisen through degeneration, do receive enmities within, and exercise them on us, while as they shall by an Idea received, be qualified with a strength of acting: it is no wonder also, if they do now and then attain the ferment of a poyson, and that Ferment being obtained, that they lay ready hands upon us. This is the brief original, progresse, and History of the *Tarrar* of the blood, and of disease Images. Furthermore, the Images of poyson, are on this wise: for in poysonous Beasts, that a poyson is made from the Image of Anger, we are taught by the Proverbe; *Morta La bestia, morto il veleno. The deadly Beast hath his deadly poyson.* The which hath place onely in the proper poysons of a Species, but not in the dead Carcasses of those that dyed of the Plague; which thing we daily experience, as well in men as in the Falcon: Because the Plague is not bred from anger after the manner of poysonous Serpents: For a sporting Dog, if he shall smite with his Tooth, he inflicts a wound that is quickly healable: but if he shall bite with an angry Tooth, although not more deeply than the foregoing Dog, now he hath made a wound partaking of the poyson of anger. But if he shall be mad, he now communicates a poyson, not exceeding that of anger, but such a one as is a Compeere of his deadly and senslesse madnesse. For a will of hurting, being through wrath or anger kindled, the Beast otherwise harmlesse, produceth a poysonous Image, and by his Tooth transmits or communicates the same. That thing is much more apparent in hurtfull wild Beasts. Therefore Sorcerers are careful, that they may borrow a deadly poyson from Serpents, being first enraged and provoked. A wantonizing young Bitch, if she lick the hand of a Child, she embladders the same; But a wantonizing Mare, seasons

the hornes of her feet or hooves with a poyson : to wit , so that they are for a present poyson to those that have the bloody flux : the which otherwise, of one that is not wanton or lustful, if they being powdred, are fryed with Butter, they forthwith cure the bloody flux : But things proper to the poyson of plants, are not from anger or dread : but a corruptive ferment is by the Creatour of the World, put into a Seminal native Imagination, for the continuing of their Seeds. For neither is there an enmity in plants, or a will of hurting of us. And so, neither doth the poyson dye away together with plants, being dryed : For there is a poysonous ferment, co-fermented with plants, from the beginning of the World, for a seminal propagation, for ends known to the thrice glorious Creatour alone. But a mad Dog, communicates a poyson by his spittle, and so by his Tooth. For the Tooth serves to a mad Dog, as much as the hand to a Woman great with Child. Lastly, The Imagination of plants; although it be the Formatrice of their owne seeds : yet it self is not free, or arbitrary, but rather a seminal Endowment; for propagating its like : and that with the total property of it self, wherein it resteth, not being alterable by forraign disturbances or enticements. Wherefore, in it self it conceiveth not a monster, nor doth ever make it of its own accord, unlesse it be provoked from without. Such therefore is the difference, original, progresse, product, and manner of the hurting, of poysons. And these things I have drawn out for that end : to wit, that it may be understood, that if a mortal poyson be forthwith made from the anger of poysonsome wild Beasts, the terrifying poyson of the Plague, may also be made through terrour in the *Archeus* of man. For, if sorrow begets a foolish madnesse, the Dropsie, or Falling-sicknesse; but anger the Colick, Apoplexy, Convulsion : and a plenteous anguish, or a lesse intense cogitation, a Furious or Lunatick person : Neither is it derogatory from Reason, that the Image of the Pest is framed within from a perturbation of that *Vulcan*, wherein the first assaults are made. The fits whereof, as those of mad persons, are oft-times taken away by succours for the Spleen. There is a small living Creature like unto a Spider, and is called by *Solinus*, *Solifuga*, because he shuns the day, being frequent in the Silver-Mines of *Sardinia*; and it creeps in secret, and through imprudency, causeth the Plague to those that sit upon it; which poyson indeed is not the true Pestilence, but a poysonous pustule or wheal : for he subjoyneth, that there are hot Fountains near, which presently abolish the poyson implanted by the *Solifuga*; So indeed, the deadly vapours of Mines, are oftentimes called Pestilent ones, because they kill the Diggers that tarry the longer therein. But they are wont to make tryal of this danger: if a burning Candle being let down into the burrowes of the Mines, it be forthwith extinguished; neither is it a wonder, if besides their poyson they also choak the light of Life, if they do extinguish the fiery light of a Candle.

CHAP. XI.

The Ferment of the Pestilence.

Consider thou how sorrowful a Dog walketh, how he refuseth meat, and abhorreth drink; how many spurs of hatred, and conceptions of envy he nourisheth before madnesse. Again, how that a full force of his conceipt being translated not only into his spittle, but into his tooth, which is cleanly wiped thorow the garments, as it were by its odour alone, and by the simple suffumigation of one smell or odour, is sufficient to stir up a late and serious madnesse in him that is bitten, for the least touch of the tooth, in what part the skin layes open, and gapeth only in the *Epidermis* or upper skin, however clean the blood leaping forth, be washed off : nevertheless, it so deriveth the Image of its own madnesse, that as the hand of a Woman with Child paints the member of her young; so a Dog by the touch of his tooth, within the fortieth day will bring madnesse. But neither doth it proceed for death onely, however the wound be onely in the *Epidermis* : but before death, the chief faculties of the mind perish, and as Lackeys, do presently follow whither they are led aside by the imaginative poyson. For that odour of the tooth, is as it were a meer nothing, an incorporeal Being : no otherwise than as the smell of an hoary putrified Hogshead, or the smell of a foot put into a new shoe, that makes a foots-step. For a Dog hath known his master a good while by his imprinted footstep, and distinguisheth that he passed that way. So the odour of a garment, or paper, being infamous through a pestilential corrupt matter, defiles us with a most subtile, unperceivable, and most thin poyson : And it not onely seasons and kills

us with a deadly poyson; but it also casts down the mind from its seat, no otherwise than as the touching of the tooth of a mad Dog under the skin, thrusts down the Reason from its majesty, and constrains it to follow according to the determined Rule of its own madnesse. For the party bitten, at a set period of time, is sore afraid at the beholding of all liquid things; he conceiveth a dog-like envy, and wisheth that he could destroy all living, and multiply his own madnesse. Writers declare, that Wormes do grow in a Wound in the head of a Dog. At leastwise, I deny not, but that a Ferment is to be supposed to be in this poyson, respecting and affecting the spirits of Imaginations: into which, the least co-participation of an odour, introduceth the Idea of its own Image, whereunto our phantasie is constrained to yield, yea, rather is fully trans-changed into that horrid apparition. For it is a wonder, that a hunting Dog, which is the first-born of all the whelps of his Dam, doth alone assault and overcome a mad Dog. There is in him the natural endowment of an unconquered Imagination; even so, that if he be bitten by a mad Dog, yet he doth not become mad: whereas, in the mean time, all the rest, do by biting contract madnesse, do flee from a mad Dog, neither dare they to defend themselves against this Dog. That poyson therefore, is the Inne of the madnesse, also, the forreign guest of Imagination, which is overcome by the Imagination of an opposing Soul. Therefore, from hence we have known that all poysons are in themselves, fermental; for, some destroy the matter onely, and together with it the Imaginative Spirit, from whence are diseases that have a foolish madnesse connexed unto them; but others affect the Spirit onely; Such as are those, which bring a dog-like madnesse, and which bring on foolish madnesse and Catalepses, or sudden stupefactive congelations: to wit, The which do not notably melt, or alter the body: but they draw only the sensitive Spirit into destruction: for indeed the *Tarantula* is scarce ever at rest, and therefore also he disturbs the man whom he hath stung, with a restless trouble. For behold, with what an horrid effigies he transplanteth his Imaginations into the man whose skin he hath pierced, but even with a slender sting. For, the vile, small, and weak creeping Animal, by an unperceivable quantity of his poyson, infects the whole man, and presently snatcheth the powers of his mind under his own protection. Also, surely the odour of a footstep doth fitly square with the Plague, being likened unto it: For although the Houses are opened in a high place, and that well-fanned with the Wind, and the infected Ayre of the House doth yield to the Winds: yet the Plague doth not therefore cease the third day after, but that it is sufficient for taking away the whole common people; for neither doth the odour of a footstep in the way being exposed to the Winds cease (though nothing in quantity) unless it be washed with Rain, or covered with earth: for it alwayes represents unto the Dog his own master. I remember also, that in the Plague at *Ostend*, the very pestilent hoary putrefaction it self, is wont a little to smell of the soales of shoes burnt, and I was wont by that odour, to bewray one to be infected with the Plague. Furthermore: before the Fall, every living Creature was subject to man, as to its master, and its middle life melted, and perished in eating, before the sight of our *Archens*. But now, even a Whelp hath a predominacy over our life, and constrains the free powers of the Soul of mortals, under his own infirmities of madnesse. For, it is a miserable thing, for the Image of God thenceforth to be subject to the biting of Insects, and that it ought to follow the various Images of the poysonous Ferment of every one: And it is a degenerate thing, for servile Brutes to season their biting with the Image of Anger, with a mad and deadly poyson. Alas, how piercingly and strongly is the Image of anger sealed? And with what a snatching speedinesse doth it passe over unto the spittle? Unto how great infirmities is a Woman subject, from the hidden Odour of her Womb? For, with what Exorbitances not to be spoken of, is her understanding vexed? For truly, oftentimes a hoary putrified Odour being communicated from the soales of the feet, casteth down our lofty Stature, and deprives those that have the Falling-sicknesse, of sense, memory and understanding. For, how readily doth the contagion of an Hypochondriacal excrement under the Midriff, alienate the mind, and seduce it with sorrow, horreur, fury, madnesse, feverish dotages, and the differences of a Lethargy, while as they estrange us according to the Image bred in their owne Ferment? For, how terrible a poyson of terrour, is at one onely moment, imprinted by a stroak of Thunder, on a Beast which it hath smitten, so that with the eating of his flesh the Plague is swallowed? Which thing at least, is for a sign, that a Thunderbolt is darted from a monstrous sign full of terrour; to wit, from whence the *Archens* being extinguished in a moment, in discovering the Image of his Terrour, perisheth almost in a moment. For sleep, yea, a deep drowsie evil is oftentimes in a man, where there is

a great disturbance of the Pest in his *Archeus*. Oft-times: on the other hand, the *Archeus* lives free and safe from perturbations: when as the man is in a miserable conflict with his owne disturbances. In Wars, and out of Wars; there are now more cruel Plagues than in Ages past: Because Wars are more cruel in dreadful fear, and have more of great dread, and lesse of angers: when man being moved against man with the violence of Wrath, studied Revenge: Neither is it a Wonder therefore, that the drinking of ones own Urine should restrain the Plague before the accesse thereof; not as an Antidote: but because it contained a hope and perswasion, before it was taken. For I remember, that in the Year 1635. while the *French men* besieged our Neighbour City *Louvain*, a very great Plague, from thence, soon after invaded the fearfull *Bruxellians*, and the poor Women who were terrified with fear; and the which, being dispersed into all the Villages, brought every where a great destruction. For a co-participation of life in meats also, causeth, that they are soon made vital: and they presently snatch hold of our *Archeus*, being otherwise lyable to indignation, fury, and a manifold misery or dammage of Symptomes: so, in *Magnum oportet*, a necessity and transplantation of much contagion is inclosed in us. But if the properties of the middle life of things euen, ought after some sort to remain in the blood: and for that cause also, the fleshes of the Eaters do vary their savour according to the diversity of the meats: it must needs be, that we are affected by those things which leave their mark of resemblance in us. Indeed favours, the witnesses of properties, have stricken a covenant, as well with the external, as internal fellowships of putrefactions, which therefore, are easily made the partakers of injuries in us. For the middle life of meats remaineth in our fleshes: hence it is, that Fish-devouring Nations, and *Carthusians* are not troubled with flies of wormes. For fleshes that are not well preserved, from the co-resemblance of the middle life residing in us, do easily stamp any putrefaction on us. From whence also, formal corruptions do arise in us, from an unthought of Beginning. And then, fleshes and fishes, although they are seasonably killed, yet they contained in them the purulent matters of diseases, wherewith, when we are fed (especially if they have before contracted a burntish odour) we readily yield unto the fellowships of their Tymbolizing mark, and they presently stir up in us, adust odours, and mumial putrefactions by continuance, in us. For, neither do Oxen or Sheep eat men, nor contract our Plague into themselves: but we eat Oxen, and draw a brutal Pest, like as also our own; Because the pestilences of many brut Beasts do play their part in man alone. Wherefore, neither are meats, not being rightly concocted, guiltlesse, while they scorn at the Ferment of the stomach, because they easily passe over into the foreign colonies and various corruptions of their own contagion. Truly, this successive alteration of new calamities in the Plague, shall at sometime, be a future betokening cause of the last times: At leastwise, the Ferments of poysons and venomes, have never been thoroughly weighed in the Schooles. But the action of these hath therefore been supposed to be equivocal or of doubtful interpretation, and prepared by an impression of the Heaven. For alwayes, when as they slide into Ignorance, they implore the too far distant aid of the deaf Heavens, and blame guiltlesse *Saturn*. For they call that an equivocal action, while the Agent doth not generate its like. As happens in Celestial Impressions and Meteours. But how improperly they have recourse unto the Heavens and their equivocal actions, for poysons, every one shall easily know, who hath beheld poysons as Agents meerly natural and domestical, they being not onely alterative after the manner of Meteours; but transchanging, and spermatical or seedy ones. For, what can be more like to a seminal generation, than if the slender poyson of a *Scorpion* kills the whole man, and propagates the property of its own seed into the whole body? For neither do Ferments any where operate Equivocally or doubly, but plainly Univocally or singly: Because, if the Pest should bud forth by an equivocal action: verily it should not be contagious, seeing it should not produce its like. Therefore it is manifest, that the diligent search of Ferments being neglected (in the commerce whereof notwithstanding, every transmutation of things to be generated, is enrowled) Poysons have been hitherto unknown, as well in their making as in their Being and operation: Especially, because the property of a poyson, is, by the destruction of the *Archeus* of man, to imprint its own seminal Image in the room of the other: Wherefore also, the Organ of this poyson is the Ferment it self. But understand thou this thing concerning poysons which attempt a transmutation by way of a seminal Image, but not of meer Corrosives: because they are those which do not fermentally corrupt the *Archeus*, or his Image; but they stir up the same *Archeus* into fury, who afterwards destroyes his own matter, or Inne: under the alteration or destruction

struction whereof, the Archeus himself also gives place, together with the integrity and retainment of his Image: For the greatnesse, vehemency, strength, and swiftnesse of poysons have deceived the Schools, who, the consideration of ferments being neglected, have passed by the one only dispositive instrument of generations, which goes before the introduction of a seminal Image: For the Schools are wont to measure the works of nature according to the square of artificial things; and so, if at any time there were any thing which would not seem to them, to square with this measure, they by a verbal excuse, have had recourse unto the heavens, and hidden causes, that they might cover their sluggishnesse and ignorances with an impossibility of sifting it out.

CHAP. XIII.

The form, and matter of the Pest.

Since a disease ought to perfect its own title, and misfortune in us, as it were in its own mansion, and its own proper essential causes do remain in its product; it must needs be, as long as any thing wanders in the air, water, or earth, that that can neither be a disease in it self, nor the containing cause thereof: Yea, whatsoever is marked with the name of antecedent causes, is nothing but the occasional cause, causing nothing by it self, but by accident, nor any thing without an appropriation received in us. Wherefore they neither betoken nor desire, nor prescribe a cure, but only a caution or flight. The occasions therefore of the Plague, are to be considered, as the occasions of diseases being sometime entertained, do passe into the order of causes. First of all therefore, I have already sufficiently taught that the Pest is not sent down from the Heavens: And seeing every effect is the fruit or product of its own, and not of anothers tree; therefore every cause produceth its own, and not anothers effect: therefore the Pest hath a specificall, proper, and not a foreign cause: For neither may we distinguish of Plagues by their accidents, concomitants, or signates; because they are those which flow immediatly from the diversity of subjects, because they diversly vary after the manner and nature of the receiver, according to the custom of the Beings of nature.

Wherefore also the Pest consisting of matter, form, essence, a seed, and properties, requires also to have its own, and one onely species; seeing the very essence it self of things or defects is most near to individuals: But if it either happen from without, or be generated within, that is all one, seeing from thence the Plague is now constituted. Again, if it do the more swiftly, or slowly defile, its issue be the more violent and speedy, do invade diverse parts, or diversly disquiet the body; yet that doth not therefore change the species of the poyson.

For they are only the signs of quantity, co-mixture of a ferment, appropriation, and incidency on the parts receiving. Otherwise, the internal and formal poyson of the Pest, and that which contains the thinglikeness thereof, is always singular in every individual: Because the essence or Being of things consisteth in the simplicity of their own species; as there is the same essence of fire on both sides, whether it be great, or little, whether quiet, or driven with the bellows; or lastly, whether the flame shall be red, yellow, green, or sky-coloured. Therefore the remote, crude, and first occasional matter of the pestilence, is an air putrified through continuance, or rather a hoary putrified Gas; which putrefaction of the air, according to the experience of the fire which Adepts promise, hath not as yet the 8200. part of its own seminal body: The which thou shalt the more easily comprehend, if thou considerest a hoary putrified vessel and hogs-head of wine now exhausted, without any weight of it self, to corrupt new, and old wines infused in the hogs-head: For I have treated in my discourses of natural Phylosophy, concerning the nature of a ferment putrifying by continuance; and after what sort vegetables do arise from an incorporeal and putrified seed, that from hence the progeny of the Pest may be the more distinctly made manifest.

Moreover, I have shewn that the earth is the mother of putrefaction through continuance; that we may know, that popular Plagues do draw their first occasional matter from an earthquake, and from the consequences of camps and sieges: For therefore, as

D d d d d

much

much as the earth differs from the heaven, so much also is the occasional matter of the Pest, remote from the Heaven. But I call this first matter, that incorporeal hoary purified poyson existing in the Gas of the earth: And so I substitute this poyson as there-more matter, under another more near poyson, which disposeth the matter of the Archeus, whereby he may the more easily assent, and conceive in himself a pestilent terrour, that at length a formal pestilential essence may suddenly come upon the previous dispositions hereof.

But besides, if I must duely Phylosophize concerning the infections of the Air, I ought of necessity, to repeat the Anatomy thereof, from the fore-assayed doctrine of the elements, in my treatise of natural of Phylosophy. The air therefore in it self is one of the first-born elements, being transparent, and void as well of lightnesse, as weight, unchangeable, and perpetual, being endowed with natural cold, unlesse it be hindered by the strength of scituations, and things co-mixed with it: but being every where filled with pores; and for this cause suffering an extension, or pressing together of it self: The porosities whereof, are either filled with vapours, and forreign exhalations; or remayning in their integrity, they plainly gape, being void of a body (the which I have elsewhere demonstrated in the treatise of a necessary *Vacuum*): For in very deed, if the air were without pores that are empty of every body, vapours could not be lifted up without a penetration of bodies: But since a most manifest enlargement and compression of the air is granted (as I have elsewhere fully demonstrated) an empriness also, is of necessity granted: For such porosities in the air, are as it were wombs wherein the vapours the fruits of the water, are again resolved into the last simplicity of waters from whence they proceeded, and are spoyled of any signatures of their former seeds whatsoever: But those effluxes in the air are forreign, by accident, and various, according to the disposition of the concrete body from whence they exhaled.

First of all, they are the vapours of pure and simple water; and then of the waters of the salt sea, which season the rain with their vaporious brine, and for that cause preserve it from corruption: For otherwise, by reason of the societies of diverse exhalations being admixed with it, rain waters would of necessity putrifie and stink, no lesse than clouds in mountains, and moist mists.

The poysons therefore, of the air being drawn in, are partly entertained in manner of a vapour, in its porosities, and do partly defile the very body of the air, without a corporeal mixture, even as glasse conceiveth odours: which defilement hath of right, the name of an impression. I have an house in a plain field, being rich on its South-side, in a wood of oakes: but on the north it respecteth pleasant meadows: moreover, toward both the mansions of the Sun, it hath hills that are fruitful in corn: But linnen cloaths being there washed and rinsed in the fountain, being hung up in the loft, look most neatly white while the North wind blows, and here and there also, from east to west, or on the other hand from west to east: But the south-winde only blowing, and the southerly windowes being opened, they are notably yellow with a clayie colour: For from the numerous oakes, a tinging vapour is belched forth into the air, and I have learned that this vapour is breathed in by us, as also drunk up by the linnen: And also, thus from Groves of oakes, after the Summer solstice, an hidden vapour doth exhale, which infecteth an unwonted countenance and neck, with a frequent itching pustule or wheale, and afterwards they become plainly visible in the legs and elsewhere: For there are somethings in the air which are perceived by the smelling of the nostrils: in the next place, there are other things, which are distinguished by dogs only: And lastly there are also other things, which are voyd of all odour, although not void of contagion.

For truly the ferment of a poyson, as such, may be free from smell: Therefore every country produceth and suffereth its own sicknesses: For why, nature is subject to the soile, neither doth every Land bring-forth all things: Because diverse vapours are brought forth in the air, according to the variety of the soile: Which things I more fully sifting with my self, have often admired, that our life is extended unto so many years: since we are environed on every side, with so manifold a guard of most potent enemies, since we admit the same so deeply within us, and are constrained to attract them against our will: And that not only by breathing; but also by a magnet or attraction, which sports after its own manner through the habit of the flesh. For I who have been often and long present without fear, among the fumes of live coals, and the odours of other things, have really felt those odours and fumes not only to be derived in a straight line into my breast: but also from thence into my stomach, and therefore that our belchings do

do express those smoaky fumes conceived: For so the breath blown out of the lungs, resembleth the smells of Garlick and Onions that are eaten, although collected thorow the Nostrils; but the plague is drawn in on both sides: But a voluntary Pest, which is begotten not from without, but within, bewrays it self in the arm-pits, and groyn, but seldom behind the ears: For this Pest for the most part, issues forth from drawn-in odours: But that which is infamous in spots, proceeds from an internal poyson, being first smothered within, and therefore the worst of all, as it is for the most part intended or increased with the fermental putrefaction of suffocation: But that which shews forth Carbuncles, is either a strong expulsion which casteth farther than into the next Emunctory, or which ariseth from the touch of a contagious matter, or from an in-breathed poyson of the plague.

For that Pest which hath invaded from a co-touching, although it be more slow than that which otherwise insulteth from an universal cause; yet for the most part it is more deadly: Because the *Archeus* implanted in the member, is slain by this plague; and from thence the part draws a pestilential Gangren; for succouring whereof, the whole *Archeus* is the more negligent; he meditating of defending the bowels, as fleeing, betakes himself inwards, and that mortal Gangren proceeds to creep. Also, remedies and their intention are for the most part idle for escharring of the outward parts, and that afterwards the Escharre may quickly fall off: For in this respect, all Emplaisters, and attracting things are administred; but they are seldom administred, as that they overcome the poyson it self: But a plague from without, as it is chiefly to be feared in the joynts; so on the other hand, that which is darted from within to without, involveth the less danger.

And indeed, that which is bred within, doth primarily terrifie the *Archeus*; and therefore it is sudden, and very powerful: But the poyson of a plague that is caught by touching, after it hath insinuated it self into the *Archeus* (because he is that which is the first living, and the last dying) and the only Ruler of things inwardly to be done) being at length confirmed, after the manner of poyson, it easily infecteth the rest: For truly, the *Archeus* himself being once infected, presently conceiveth a pestiferous image of terrour, and the raines of governing the body being forsaken, he communicates it to his Associates.

In the next place, although sweat be profitable in every plague; yet less in that which hath privily entred by an external co-touching; at least, it is in no wise therefore to be neglected. Moreover, in the plague of a particular individual person (by whom the whole people in common are now and then afflicted) there a fermental putrefaction doth for the most part begin within, which being once suddenly laid hold of, the poysonous image of an Archeal terrour is from thence the more easily committed. That Pest is the more swift, which is drawn inwards from the external putrefaction of an odour; because it presently associates unto it two degrees, to wit, a putrefaction through continuance, and a mumial and co-mariageable ferment: But there is no need, that that hoary putrefaction should be perceivable by the nostrils, with an avernsels: For if dogs, which exceed us in smelling, do sent an hoary putrefaction, or the foot-step of their Master in the way; our *Archeus* himself doth as yet far more easily smell out those things which are within, and therefore, a putrified odour cannot hurt, unless it shall find a mumial ferment within, whereunto it may couple it self: Then indeed there is now forthwith a forreign matter, nevertheless, as yet wanting a contagion: Therefore it behoveth, that the matter be furnished with full conditions, and with a formality of acting: For these two are as yet, as it were the occasional and provoking causes. Again, as concerning the Tartar of the blood, there hath been enough spoken, that it is a product of the Pest, and that it waits for this, or is made out of hand at the coming of the plague. The first term therefore of making the Pest, is an hoary putrified Gas, the which, seeing it cannot infect without a co-resemblance of appropriation, it requires another correlative term, which is a mumial ferment (without which there is not an appropriation) to wit, the *Archeus* the receiver of the Pest: For truly the poysonous matter of the plague being by contagion derived into us, defiles not any one, unless the *Archeus* shall lay hold of it, and appropriate it to himself; wherein surely, the *Archeus* labours improvidently: For from thenceforth, the Pest conceiveth a terrour, by his own phantasie, but not from the fore fear of the man; to wit, in which phantasie of Archeal terrour, the *Archeus* brings forth a pestilential poyson, which is the very Idea of the conceived terrour, being cloathed with the proper coat of the *Archeus*: Alas, then the Pest is present within, and doth soon easily disturb the whole man. The image of the Pestilence there-

fore, consisteth of an Archeal air, as of the matter containing, whereon the poyson of the terrour of the Archeus is imprinted, as the immediate efficient cause: For neither therefore doth the poyson of the plague, always defile any one whatsoever, although it shall presently find an odour in us agreeable to it self; because the munnial ferment, although it be internal, yet nevertheless, it is only an occasional mean, in respect of the contagious application, or of the infection applied; which appropriation immediately consisteth in a real and actual congress of the image bred by terrour, which the Archeus conceiveth from the aforesaid application, as thinking in this respect, that now there is a potent Enemy entertained within the Cottages of his own house; which panick fear of the Archeus, is the immediate cause of the image bred by imagination: (therefore I have proved, that there is an imagination in the Archeus, besides that which is decyphered by the conceptions of the mind, as well in the Midriffs, as in the Heart, and Brain) which image is the suitable cause of the Pest; I say, the veriest Pest it self, no otherwise than as a Chick is nothing besides the Egg it self ripened by a cherishing warmth: For Purple or spotted Fevers have therefore indeed, a poyson and contagion, besides putrefaction, and a ferment of appropriation (to wit, from whence they defile men alone, nor likewise beasts) yet they want an Idea of terrour, whereby the Archeus being full of confusion and desperation, neglects his government, and frames the deadly and seminal image of a pestilent poyson.

In the next place, he easily insinuates this his confusion into his own transchanged nourishable liquours, over which before he carefully watched, and now degenerates them into the hostile Tartar of the blood: For the Archeus forsaking the Stern of Government, like a man that is sore afraid, rashly turns all things upside down, and himself being a run-away, proclaims that an Enemy is received within, darkneses are made, the appetite is prostrated; and every digestion of the shops begun, ceaseth, and that which is almost, or half digested, is corrupted, because it abhorreth the sorrowful image of a mortal poyson. There is therefore a sedition and noise within throughout the members, because the implanted spirits of these, do well perceive the confusion of the inflowing spirit, but are not able to restrain it: For if the nourishment being half digested, were fresh and mild in the stomach, a drowfie evil ariseth, and likewise vomiting and loathing; but if it be now dry or stiff through digesting, the headach possesseth the man: But if it be well nigh digested, it putrifies with a stinking burntish savour, from whence there are continual vomitings: For all things go astray, and do putrifie under the image of the poyson, and the nourishment of the stomach it self, degenerates into a filthy muckiness, the which also, doth oft-times put on a caustical or burning sharpness, and there is for the most part, a murmuring noyse about the stomach: For why, where the first and inordinate conceits and violent assaults of men are, in the same place also of necessity, the first confusion of the terrour of the Archeus ariseth, and there is made a most filthy image of the plague. For I have noted, that the Pest hath for the most part, placed its first seats about the stomach. For a certain man being dejected with a continual vomiting, felt a great pain of his head, and by and by a doating delusion; and then he also having suffered a deep drowfiness by intervals, died in sixteen hours space, many fainting fits having gone before.

But I desired to know, from whence he had so speedily died, and with so great a fury of symptoms; neither did a Chyrurgion desire to be present: at length, I began the dissection with a knife, and I found his Stomach now pierced with a three-fold perfect Eucharre, in such a manner as I had once seen the stomach of a Servant-Maid to be pierced, who had willingly drunk Arsenick. In the mean time, in every Plague, a Fever ariseth from the beginning, because also a sore threatned corruption hath begun in the Archeus: Surely all vital things are affrighted in the natural directions of images scattered through a dreadful discord, confusion, and desperation. The Tartar of the blood also, being now freed from its Laws, in so great a confusion of the whole body, snatcheth to it a fury, it struggles in the conceived borders of its own part whereunto it adhereth, and through the confusion of terrour, increaseth all the tumult.

This is the Tragedy of the Pest, which I at sometime through divine clemency saw in an intellectual dream: But the great fear, flight, desperation, &c. of the Archeus, is not the poyson it self; even as neither is the wrath of a living creature the poyson thereof: But the poyson of the plague, is a Being produced from the image of dread, and cloathed with the substance of the Archeus; as the anger of a Serpent, lays aside the image of his anger in a part of the Archeus, and lays up that image in his Spittle, &c. at the executive Organs of anger.

But

But the poyson of the Pest is in it self horrid, and far more cruel than the mortal contagion of Serpents; to wit, that which is produced in beasts by a vital perturbation, such as is the anger of Serpents: For the contagion of the Pest creeps into the standers by; neither doth it perish with the life of the Animal; as otherwise, the poysons of beasts are wont to do: For that the poyson of the Pest doth not inhere in the life, but there is an image in the air effuming from thence, and that indeed clothed with the infected Archeus; as thin sanies, blood, corrupt pus, vitriol being sprinkled on them, have as yet retained a life and vital actions on the whole body from whence they issued, the which, the magnetick curing of wounds, ulcers, and broken bones at this day hath taught us.

But moreover, the Pest rather drives from it the fugitive life, the fearful and fleeing Archeus; and as the madness of a Dog assumes his product in his spittle, so the poyson of terroure is sealed in the Tartar of the blood, even as also it is dispersed into the air, and an odour departing afar off: For therefore beasts are the free beholders of our calamity, because they want the defect of an univocal or self-same Archeus, and therefore also an appropriation: Yet any subject whatsoever, whether it shall be air, a garment, or any other more solid body (although ignorant of dread) which may be seasoned with an odour, may in like manner be the subject on which the product of a dreadful imagination may be imprinted, no otherwise than as the earth resembles the odour of a swift foot-step.

Furthermore, although the Pest or Plague be only one in the species, yet it invades after divers manners: For at one time, a popular plague assaults, which ariseth from a divulged hoary putrefaction, after an Earth-quake, out of Caves, Clefts, Pools, Mines, and dead carcases, as well those of beasts, as of men, which belch forth a poyson putrified through continuance: The which notwithstanding, is not as yet pestilential, until that it being received within, shall then at length be appropriated to a ferment: From whence indeed, the Archeus being affrighted, creates that cruel image of his own confusion and terroure. It invades also, only by a pestilent odour drawn in from a sick person, or from a dead carcass, or from a place, or from an infected matter; the which odour, by how much the more subtil subject of its inherency it shall have, by so much also the more speedily it infecteth, and the more speedily approacheth to the Archeus, by reason of a mark of resemblance: For neither therefore doth the exhalation of sweat so speedily infect, as a pestilential Gas that is not perceivable in its odour: For just even as the Gas of coals disturbs the stomach, provokes vomit, headachs, yea and also, swooning; so I have noted plagues, which by a subtil exhalation, do infect the immediate nourishment of the stomach, that they brought on continual vomitings, hickerings, frequent swoonings, and doating delusions, and most speedy death: and that vomiting refuseth remedies to be swallowed down, the swooning-fits do cast down the strength, as also the doatage is averse to food, and remedies. But the matter that is now infected, if it be to be taken away by sweat, in passing thorow, it defiles the whole house even to the skin, unless the malignity thereof be restrained by remedies: For although a remedy may readily touch at that infected matter, yet it doth not easily bring forth that matter which doth not willingly follow: For truly, any Antidote, doth never restore the party that is once infected, into his former state; and therefore all the care of an Antidote is only about the preservation of those that are not yet infected, and the mitigation and speedy expulsion of these. Also the occasion of a popular plague is difficult, because infected places and bodies cannot be avoided; which thing, in Camps, and besieged Cities, clearly appeareth: For we read, that in the East, a plague began from three Souldiers who violated a Sepulchre, that it defiled the Roman Camps, and killed a third part of mortal men, throughout the known Coasts of the world: For such a plague is most swift, and most cruel; the which indeed brings into the body along with it, almost all concomitants needful for it self: For since the poysonous matter hath already obtained a ferment, it ought not to parley with our Archeus concerning its reception, the which it easily obtains by request, from the disturbed Host: for truly, it brings with it an Idea already in it self, from a former cause, and attains from the Archeus a new Idea within, co-like to it, for its companion.

But the Pest which begins, and perfects the whole generation of it self in us, without an external help, is made from a fore-existing fermentally putrified Tartar of the blood, which doth soon of its own accord, most readily put on the odour of a dead carcass: From whence, the Archeus being fore terrified, stirs up an Idea of the conceived terroure, and so a pestilent poyson is stirred up, and the seminal, and hurtful image hereof is incorporated in that

that excrement, the which therefore proceeds in raging and infecting: For the Plague is communicated unto us by an unsensible air, which Flies, Pies, Ravens, Crows, Eagles, Dogs, Wolves, &c. do for the most part distinguish: For it is very well known, that the household Animal a dog, discerneth every one by his odour, or that he doth even a good while after distinguish the footsteps of any one thereby, however lightly imprinted; and a pestilential Gas is alike subtil, and odourable: Therefore there are different manners of attaining the plague; to which end, it is meet to repeat, that a pestilent poyson is only of one particular kind, nor that there be many parents of the same thing, distinct in their species and seed; that is, that its seeds cannot be divers: So that a Scorpion bred from the herb Bazil, and from a Parent, differs not in kind; as neither doth a Louse which proceedeth from Nits, and which sprang immediately from a man, lay aside a specifical identity: for Nits, or the Eggs of Lice, are in the sameliness of the Archeus, with the matter from whence a man doth immediately generate Lice: Because if two seeds divided in species, should constitute one and the same thing in the species, specifical dispositions in the matter for the generation of things, should be in vain, but all things from all, and every thing from every thing, should promiscuously proceed: Agents therefore that are divers in kind, although they may constitute something under a specifical sameliness; yet the same seed, and that of the same Archeus, must be understood to be formed from them both: So a man maketh a vital excrement, from whence proceeds a Louse, a Worm, &c. and he so disposeth that matter by his cherishing warmth, that it attaineth a co-like Archeus, which the Louse generating, originally implanted in his Eggs: and so the Louse that generateth, is the univocal agent, which extendeth from himself sufficient matter for Generation: But the man is the equivocal agent, which afforded from himself an excrementitious matter, which matter sliding on, doth at length, in the cherishing warmth, attain a co-like Archeus: So a dead carcass generates into worms, and these do again sexually generate: and so Mice are generated of excrementitious filths, and again by parents; and that wholly in Insects, whose seeds are issued from bodies putrifying as it were of their own accord: at leastwise, the immediate matter of these, and agent of these Generations, is on both sides simple, uniform, and of a specifical identity or sameliness: Therefore also, both constituted bodies are of the same species, generating afterwards their own like, without choice: So that Lice which proceed from our exhalations, do admit of copulations with those which through a cherishing warmth, came forth out of Nits.

The immediate matter therefore, and immediate agent in the Pest, are on both sides of the same seminal Archeus, and specifical identity: For whether the matter be made within by degrees, or on a sudden, or being drawn in from without, be actuated in us; at leastwise the poyson of the plague is never made, but a terrour of the Archeus hath brought forth that poysonous image. But I call terrour, as well that of a man sore smitten by the first assault, as that of the Archeus of man it self, and of the blood, received from an antipathy.

After this sort, a bold and stout man is oft-times before or in presence of the plague, fearful; yea, he who scarce fears the plague, hath his Archeus within, subject to affrightments. For so, an Infant that is incapable of fear, and ignorant of apprehension, is not more slowly laid hold of by the plague, than a poor timorous woman: For although a sturdiness of mind may prevail as to prevention, yet it doth not kill the poyson already conceived. And there are divers boldnesses of Magnanimity: for some one man is undaunted in a single combat, who in the conflicts of war, is fearful: another is not affrighted in fighting, who is notably afraid of Hobgoblin Furies: Lastly, a third feareth not Enemies, but he is afraid of armed Countrymen, &c. *Galen* thinks that a good complexion *ad pondus* or according to an equal weight of the Elements, would give strength to resist the plague: He I say, who would have all particular parts and bowels in man, to differ only in the unequality of the temperament of the Elements, now granteth an equality of the Elements flowing together according to an equal weight, in the one humane kind: whenas otherwise, if the heart were the most temperate part, now the whole man ought, according to any of his parts, of necessity, to have the consistence and hardness of the heart. But I as the first, have rejected the opinion of Elements, co-mixtures, and temperaments, as foolish and totally false, by firm demonstrations, in the Volume set forth concerning the original of medicine. This co-mixture of Elements therefore, I willingly yield to the *Galenists*, and am willingly ignorant, after what manner air, or fire can be weighed, that being weighed together according to the weight of water, and earth, they may compose from themselves, flesh, sinews, bones, brain, heart, marrows, &c.

Ah

Ah, vain fiction, cruel wickedness, hissing it self forth against our neighbours. Moreover, the animosity or stoutness of mind which I praise, is not affrighted by death, or the plague, it adorns the *Archeus*, that he may resist the poyson, and expel that poyson received by accident (but otherwise, he cannot overcome or kill it) no otherwise then as terrour shuts the pores by the motion of nature being obedient unto it: Wherefore they who have recovered from the plague, are scarce alike easily infected with the plague the same year: The contrary is seen in other diseases and poysons: For truly these do not onely leave behind them weaknesses from whence there is a more easie relapse; but also other poysons do operate, by changing the parts wherein they are entertained. But a pestilent terrifying poyson primarily invades the *Archeus* alone, and sorely affrights him: The which, when he hath once known, and overcome his enemy, he afterwards presumeth and is made more confidently bold, that he shall not so easily fall under him: neither is he thenceforth so easily affrighted through occasion of the poyson brought unto him: neither doth the weakness which the Pest leaves on him, hinder; because it is sufficient that he is not alike easily terrified, and that he doth not decypher the pestilent image of terrour in his own proper substance: And therefore other poysons of diseases are far more grosse than the image of a drawn-in terrour: For some hurt not, but under on open skin; but others require to be eaten, or drunk.

But the most rare poyson of the Basilisk or beholding Cockatrice, is sent forth by imagination directing the sight: But a pestilential poyson is framed within, by the proper conception of the *Archeus*. Other poysons are bewrayed by some sensible signe: But the Pest alone is communicated by an unsensible contagion, even so as the foot-step of a man keeps its odour. Behold how the image of sudden sorrow prostrates the appetite, how the image of a nauseous matter creates vomiting, the image of condolency produceth tears, the image of slow sorrow or lingering grief stirs up sighs, the image of fear generates the Falling Sicknesse, and how and then the Pallie: Therefore I elsewhere writing of Diseases, have not in vain demonstrated that joy, fear, anger, hatred, and other passions and perturbations, do generate in us, their own proper and singular actual image, no otherwise than as terrour doth the Plague: But the generations of these are the domestical and more ordinary off-springs in us. But the image of a pestilent terrour, brings forth a poyson immediately existing in the *Archeus*, and draws its own matter from the same: And therefore the Senses cannot conceive that image. The *Archeus* therefore, having beheld a mortal enemy nigh at hand, being bred within, or brought to him from far, admits this enemy through his own terrour, and an image decyphered anew, and confirms him with his own character and substance: For our hand being moved to a Carcase that died of its own accord, soon waxeth so cold through the flight of the *Archeus*, that it at length scarce waxeth hot again at a long fire: Yet Dogs perceive not that cold, while they devour such a dead Carcase, even as the dead Carcase of a Beatt doth not much cool us: Therefore the cold of an humane dead Carcase is fraudulent and accidental, and doth more cool, than it hath of cold: And the Carcase that died by little and little doth more cool us than the Carcase of a person that died of the Gowt, or of a sharp Fever. Yet since we discern by an engine whereby we measure the degrees of the encompassing air, that the cold of both these Carcases are equal; To wit, the *Archeus* being sorely afraid of death (which the hand applyed to the dead Carcase extinct by a long infirmity, perceiveth) flieth, forsaketh the hand, neither (because mindful thereof) doth he easily returne: Therefore it is manifest, that the *Archeus* doth perceive and shun death, even that which is before and out of himself. And as yet more, the ferments of putrefaction (as in the cold fit of an Ague) being conceived or bred within, And most especially those, which being received within his family-administration in manner of an image, do tend unto a formal transmutation of his own essence: Because the poyson bred through an Idea of terrour, is of the highest actual power: And the image of fear and also of dread, differs from the image of terrour, by reason of the formal activity of faith concurring, even as before I have noted. And moreover, although the *Archeus* doth well perceive death, and poysons, yet he doth not well perceive the poysonous terrour, because he thinks it to be his own terrour, and a vain passion, until that by the fore-gone ferment of appropriation, he hath certainly known that that poyson was a foreigner unto him, which he had laid up in a part of himself, while he formed that foreign Idea; and so, with a certain destruction of himself, he presently expels the poyson from him: And I wish, that the power now inbred in him, were not communicated throughout the whole body, by what way it proceedeth. For so the poyson of a mad dog is in no wise thoroughly perceived by a man, as neither by his *Archeus*, except after that it hath established a ferment

ferment for it self in the *Archens*: In the which then image of doglike madnesse, since there is presently an estrangement of the mind connexed; Hence the *Archens* conceiveth no terrour to himself in fury: For he stumbling in imagination, rather shakes off terrour, is rashly mad, and by the poyson of the mad dog is directed into an *Hydrophobia* for the disease causing a fear of water.

Lastly therefore, the one onely poyson of the Pest hath also the one onely beholding of terrour, and one way unto the grave, or unto recovery, by good, or unfit remedies. But whatsoever things I have hitherto spoken concerning the pestilent Idea of terrour, I will not have to be interpreted at liberty: For a fear from enemies, from a thief, from a disease, from an hurtful Animal, from a Sword, do indeed generate an image of dread, but not a pestilent one: which image I have therefore denoted with the name of terrour, as distinct from an image of conceived fear, whereby a living creature is affraid. A pestilent terrour therefore, doth not here denote any terrour, or the dread of any calamity; but onely a pestilent horrid poyson conceived in terrour, as well by the man, as by the *Archens* of the same. In this Idea therefore, is situated the essence of the Pest, and the thinglineffe of this whole Book. I confesse indeed that the images of any fear are easily changed into the Idea of a pestilent terrour, even so as a woman great with child, deriveth the image of a mouse on the undefiled flesh of her Young, yea hath sometimes transplanted the whole Embryo into an horrid animal or monster: Because, as I have elsewhere taught concerning formes, formal images do mutually pierce each other, and the latter doth readily draw the former into the obedience of it self, which *Hipocrates* calls a *leading of seeds whither they would not*. Truly to convocate a diversity of elements, and a combating assembly thereof for a mixt body, and likewise of complexions, humors, and conditions, inclinations, and studies sprung from thence: Lastly, the divisions of climates, angles or quarters, ages, proportions, strengths, bignesse, and interchangeable courses, for a succour of ignorance, that hereby we may make the more, greater, and more difficult calamities, may increase uncertainties, may rule ignorances, may beget doubts, may patronize impostures, and promote despairs of life, is nothing else but to have laboured in vain. For the perfect light of Sciences, is like fire, which burns up every combustible matter without exception. Such a Science *Hipocrates* had in times past obtained.

CHAP. XIV.

The property of the Pest.

I Have demonstrated that the passions of the mind do destroy the appetite, as also procure digestion: In the next place, that the first motions of cogitations do obtain their own assemblies in the midriffs: Therefore also I have dedicated the mouth of the stomach unto *Mercury*, whereunto the Heathens have attributed the sharpnesse of wit, as also the sleepifying white wand of truce: I have also said that the plague is originally conceived from the terrour of man, and that the air which being brought out of a pestiferous body, is carried into us, doth at its first assault rush into the spleen, which presently shakes out the same, and delivers it as it were by hand, unto the Orifice of the Stomach: From hence are dejection of appetite, vomiting, head-ach, dotages, faintings, thirst, the drowfie evil, &c. But the Plague which is made in us, even as that which is drawn in from without, have their own Inns wherein every one begins to rage: But as long as the Idea of sorrow and fear do besiege the Tartar of the blood in the Stomach, and as long as the image of the terrour of the *Archens* is absent, the Plague is not yet present. In the mean time indeed, it comes to passe, if they shall keep themselves the lesse exactly, that the Tartar of the blood being more and more malicious, doth at length terrifie the *Archens*; and he stamps a pestilent poyson on himself.

For Plagues which are bred onely through terrour, are more swift, and much more terrible than those which proceed from an infected air: for this perhaps strikes many to the heart; because the stomach, seeing at least it is a membrane; yet I have placed the perturbations and first assaults, even in the Orifice thereof, or in the spleen, at least wise, in that extreame or utmost part of it self which lays on the orifice or upper mouth of the stomach;

Stomach; and from hence a ferment is bestowed that is requisite for the necessities of digestion: But the Schools themselves call the mouth of the Stomach by the Etymology of the heart; For a wound of that place, and a wound of the heart, do kill with the same symptom, and alike speedily: For I have seen many, whose head a strong Apoplexie had made plainly unsensible and dead; yet that were not in the midriffs many hours after: For a Bride in a Coach nigh *Scalds*, is saluted by Country Musqueteers, and the bullet of a Musquet smites thorow the temples of her head, not a little of her brain is dashed out, and her head presently dies: But she being brought to *Vilvord* four leagues distant from thence, her pulse as yet afforded testimonies of life. Is not also the vital spirit, being a certain ruler of the whole body, in the womb? and the which is onely a membrane, after the manner of the stomach? and the seat of far greater disturbances than the liver, lungs, and kidneys. Truly the members in themselves are nothing but dead Carcasses, but the spirit is the Governour which quickens those members; which spirit, and after what sort, God hath planted where he would. Indeed I remember that I have often seen, that those who had the Tartar of their blood corrupted by some kind of fear of the Plague; but without belief, or presumption of a contracted infection, did undergoe an uncessant anguish and combating day and night, yea although they were wise, and laughed at their own perplexities; yet they were not able, but that as restless, they would present the image of fear conceived, before their eyes: For they were like unto those who were bitten by a mad dog, who will they, nill they, have their imagination readily plyable at the pleasure of the poyson. At length, in the very Tartar of the blood sticking about the midriffs, I have found a proper natural phantasie, which the image of fear conceived in the spleen, had feigned to itself: So, lascivious dreams do not always follow from the imagination of the fore-past day; but for the most part also, from the matter it self predominating in the Testicles; no otherwise also, than as one that hath a desire to make water, dreameth that he doth continually make water: Therefore the terrour of the man is the occasion of the Pest, and the terrour of the *Archus* is the efficient cause of the pestiferous image and poyson: For it is as it were the Father of the Plague, the which, the poysonous image being once bred, although it may cease, at least wise, the Plague conceived is in its own image: For if the terrour of the man were a sufficient cause of the Plague, of necessity also the Plague should always follow a pestilential terrour, which is false: even as also, in an infant, who is void of all terrour, the Plague is received at pleasure: From whence it is sufficiently manifest, that the *Archus* himself being affrighted, is the primitive efficient cause of the image of the pestilence. The plague therefore consisteth of a defilement, to wit, of a contagion, in the swiftnesse of its course, in the singularity of its poyson, in the terribleness of its concomitants, lastly, in a difficulty of preservation, and curing.

But indeed, I leave behind me the inquisition of that plague which is sent for a punishment by reason of the hidden judgments of God: The which although it be plainly above nature, yet in the mean time, the matter thereof is not a creature lately made of nothing: because it after some sort, enters the borders of nature: For the smiting Angel stood not on a mountain, which the continual water of the air flowing over it, well washeth by licking thereof: Neither stood he also on an high Tower, and where notwithstanding, the sin of *David* in the lust of concupiscence, had took its beginning: but he stood on the hoary putrified threshing floor of *Araunah*. So the Angels in the Revelation, pour out their Vials, from whence the third part of men shall at sometime perish. The word, yea the beck of the Lord can do all things, without a floor, a scabbard, a sword, Vials, the effusion of Poyson, &c. But such is the bounty of his piety, that he inflicts not such punishments nakedly by his word; perhaps by reason of the perpetual constancy and irrevocable firmnesse of his word; nor also by evil spirits doth he send a supernatural plague, lest he should deliver the living into the hands of their enemies. At length, the plague produced by enchantments (if there be any) follows nature: For truly, the Devil is not able of himself even to make one gnat, unlesse he assume the seminal Beginnings thereof; even as his magicians could not make gnats, the off-springs of the waters, of dust: wherefore also, they confessing the impotency of the Devil, then cryed out, *truly here is the finger of God!* If therefore it shall at sometime be granted to the Devil to form the plague, surely he drew that from the principles of nature:

And the diabolical plague should differ from the natural ordinary one, in its application and appropriation: For he should more toughly apply the astuation and impression of the poyson, no otherwise, than as the bellows doth at leastwise promote and heighten the fire which it made not: but he should appropriate it with a fore-going preparation, by

the image of terrour drawn in and borrowed from his bond-slaves: And although such plagues should be more cruel, yet they should yield unto the same natural remedies. But I call them more cruel ones, by reason of their swiftness, to wit, the image of cruel envy had from witches, being over-added: notwithstanding, such permissions should as yet be limited unto persons and number; yea should be more easily expiated by prayer and alms-deeds, than ordinary plagues: To wit, whereby God taking pity on mankind, may the rather hate diabolical arts, and make the Devil grieve at divine mercy soon shewn. But that good spirits are the framers of the Pest, surely that is from great compassion, that we may not be beaten but under the command of obedience, by the rod of the Lord, and not of Angels: For God every where keeps a *Decorum*: He takes Sergeants and Guardians, who have a native goodness, who keep friendship, nor can assume a divellish disposition, for which they know there is no place in Heaven. But before he would deliver *Sodom* to the Devil, he first deprived it of a few innocent persons.

But the plague which ariseth from a curse, by reason of the extreame anguish of mad poverty, by reason of a teeming woman that is forsaken, by reason of a wounded person, &c. is a plague of divine punishment, which surely is scarce supported by the Beginnings of nature, and is easily discerned; because it invadeth onely such places and persons cursed: And likewise the rich who sit in Ivory Seats, who drink out of gilded plate, who eat the Calf from the Herd, and the fat Sheep from the Flock, and do not remember their imprisoned brother *Joseph*: Because the Lord adjures or earnestly swears the destruction of these, that others may as it were in a looking-glass behold, what it is to have pleased, and displeased God.

But Plagues which follow Camps, and rage for the most part some moneths after a sledge, are not to be ascribed to the slovenliness of the Souldiers; especially if they shall begin a good while after the City is taken, as for the most part it comes to pass: For Camps had also in times past their own, and the same impurities of Souldiers; but the occasion is that of the smell of dead Carcasses putrified through continuance, which is infected with a mumial ferment: because that at this day, the slain are not buried as in times past, nor deep enough in the earth: In the next place, because they are hurt by an invisible bullet from far, which moves a greater terrour in the *Archeus* than while spear to spear, and sword to sword were stoutly opposed: For neither was it in vain commanded in the Law: *That whosoever should touch a dead Carcasse, should be impure, and that he was to be clean washed, together with his garment: And that the Sun was not to go down upon the bodies of hanged persons*: Which things surely in a literal sence, are thus prescribed by God for the good of a Common-wealth, least the mumial ferment should putrifie by continuance. Therefore it is the part of blindness and rashness to be bewailed, for the bodies of those that are hanged to be shewn in a bravery for a spectacle, until they fall off of their own accord (indeed a small profit accrues from thence for so great evils) and it is all one as if the Judge should say; God indeed hath so appointed it; but the Magistrate hath corrected for the better: As if it had been unknown to God that the Spectacle of an hanged person would be more affrightful to evil persons or offenders: Therefore if God hath known this, and neverthelesse hath given an expresse command for burial, it is no wonder that punishment follows transgression as a Companion:

But God follows the guilty eternally as a revenger behind, and I wish the punishment were turned onely upon the transgressours: for to bury is a work of mercy; but to shew the guilty hanged in a bravery is not that work; according to which it shall at sometime be pronounced, *Go ye Cursed, or Come ye Blessed*. For truly, to bury the dead Carcass of a condemned person, is a work of no less mercy, than to bury a Prince: And this mercy is not so much exercised toward the dead party, as toward our neighbours, least the following stink should infect them: For neither to be buried, doth profit him that is buried, but the living: Therefore the Scope of Divine Goodness consisteth not onely in burying, but in inhuming deep enough: which particulars will be made more cleer by an example: For a dead Falcon being cast behind the hedges, and half putrified, is devoured by a live one, but presently he is taken with a most contagious plague of his own kind; Because the poyson of terrour being received within, smites on his *Archeus*, by reason of a mumial co-resemblance infected with a putrified fermental hoariness. And the Pest of the Falcon is so great, that the pestilent Falcon being brought through a Street, infecteth all other Falcons which are brought that way for three dayes after: Whence thou shalt conjecture, what the dead Carcasses of men, as well of those that are hanged, as of those that are carelessly buried, may do by their odour? For a Dog eats not a Dog, unless he be dried in the smoak, to wit, while the mummy hath lost the horror of death, through

through the estrangement of its tast, in preserving from corruption: but a Wolf eats a Wolf newly killed, but not a putrified Wolf: Whence there is a suspicion, that there is something in a Wolf which is superiour to a mumial appropriation: Perhaps *Paracelsus* supposed, that that was it, wherein the first act of feeling of an applyed object fitteth: Peradventure also, for that cause, they have thought the Tongue of a Wolf hung up, to be adverse to the plague.

And moreover, the dead carkasses of souldiers, are at this day to be buried deeper than in times past; because the Bullet of a great Gun, or Musquet makes a confusion, and then, it takes away some part with it; wherefore, it produceth an open hole, and at length also, it begets a poysonous impression of smoak; from whence, the flesh round about, presently looks black with a certain Gangren, and it readily receives a poyson into it, if not in life, as leastwise soon after death; to wit, while as through a speedy putrefaction of the flesh being combided into the earth; a cadaverous, hoary or fermental putrefaction doth arise; unto all which is joyned in the Archeus of the dying-souldier, an Idea of revenge, which is prone to putrefaction:

From thence into the air, a monstrous Gas, I say, is poured out into the air, which smires the Archeusses of the living with terreur: For it is with a dead carkass, just even as with horse-dung, which doth not putrifie so long as it is hot: But when it grows dry, and the Salt-Peter thereof hath departed from thence, the dung also inclines to be trans-changed into the liquor of the earth: For otherwise, if the dung be restrained from putrefaction, through the be-sprinkling and stirring of horse-piss on it, and into it, it produceth much Salt-Peter: For behold thou how powerful a nourishment the mushrome of one night is (for indeed a Mushrome is the fruit of the juice *Leffas* or of plants being coagulated, and near to its first Being; the which I have elsewhere shewn) but after it hath assumed the putrefaction of the earth through continuance, how cruel a poyson for choaking doth it bring forth: We must therefore have a diligent care, that a fermental putrefaction doth not arise in the reliques of the last digestion: For indeed, the plague privily entred my own house, through a Chamber-Maid; she forthwith recovered: Both my Eldest Sons being sore troubled in their mind, shew an undaunted courage, and concealed, that they were vexed with a continual combat of sighing at the mouth of their stomach: and when as through the wiles and framed deceits of my prevalent Enemies, I was detained at my own house under prevention of an Arrest; both my Sons also, would not by forsaking me, go into the Country: and since they had observed at other times, that they were refreshed by swimming, in the midst of Summer, they swam thrice without my knowledge; whence transpiration through the pores being stopped up, both of them being forthwith devolved into a Fever; together with a dejected appetite, pain of the head, and a *Catochus* or unsensible detainment of the Soul, with a pricking of the whole body, they died among the Nuns, swearing that they would admit of my remedies: but after that they had received my Sons, they refused forraign remedies: The Eldest indeed, perished without any mark or signal token, even after death; because his skin being cooled by swimming, nothing outwardly appeared: But the other shewed only a small black and blew Pustule in his loyns: and the loss of these my Sons, I frequently behold, as if it were present; and thou mayest suppose that it gave a beginning unto this Treatise. I leave vengeance unto my Lord, whom I humbly beseech, that he would spare my Enemies, and bestow upon them the light of Repentance,

CHAP. XV.

The Signs.

I Have hitherto written unwonted Paradoxes: my understanding being without the Moon, was drowned in tribulations: there was a matter most full of terrour, horreur, and of difficulties present; a great Reader incapable of the best things, a darksome brevity of beginning, and a hateful novelty, although a very necessary one. But that which chiefly blinds us in the Pest, is the want of an exquisite and unseparable sign; to wit, through the admonition whereof, we may be able timely enough to prevent or withstand it by remedies. Nevertheless, whatsoever created thing is in any place, it hath its own discernable signs, by which it may be fitly distinguished from other things: and these, those which do precede the plague, do accompany it, or soon follow after it. But those signs which go before it, do make for its prevention: but whatsoever signs do afterwards follow, serve more for others, than for the miserable sick: But the accompanying signs alone, do discern of the cure.

And moreover, the signs of a plague to come, are decyphered in the heavens, if the Firmament sheweth the handy-works of the Lord in the earth. That the signs thereof are badly referred by Astrologers, unto twelve divisions of causes, I have already before sufficiently manifested: But *Gaffarel* hath lately described an Hebrew Alphabet, from the scituation of the stars, and authority of the Rabbins; by an argument ridiculous enough, whereby the Hebrews devise such wan signs: as if God had now, the Rabbins only as his servants, unto whom he may communicate his secret counsels: For Christians do not consider the shamefulnes of those positions, who suffer such kind of books to be printed: For neither do the fixed stars change their places, that they may sometime describe these, and sometime other things to come; the which, in the first place, is contrary to all Astrology. Comets also, the Meteors Trabes, Dragons, Darts, and other monstrous signs of that sort, being oft-times popular, have foreshewn popular plagues; but not by a rational discourse, or Theories of the Planets, and much less by the Alphabet of the Hebrews: for irregular lights do not obey set rules: For the Astrologers of *Jerusalem*; although most skilful in their art, yet they were altogether ignorant of the signification, as also of the apparition of the star of *Bethlehem*. For the Lord will not do a word, which he will not reveal to his Servants and Prophets. *Amos 3.* But of these things Artificers have no knowledge; because new lights have been oftentimes mortal, and oft-times have directly signified prosperous things: For monstrous signs do in the hand of the Lord, make manifest his secret judgements, neither doth he manifest those but to whom he will: For truly, the Conjunctions, Oppositions, and Quadrants of the Stars; likewise their Eclipses, Retrogradations, Banishments, Combustions, Receptions, and other impediments, are supposed to be so regular, that they are sometimes described in Ephemeris's for an age: But the Pest is of things extraordinarily increasing, and those not necessary: But a regular mean is not a meetly suitable sign for an effect from a contingency by chance: Neither therefore could the Ephemeris's or Planetary daies-books of *Brabu*, foretel the plague in *Lumbardy*, of the year 1632. which was conceived from an unjust war, and the fear of horreur: Wherefore, I attribute extraordinary contingencies or accidents, unto extraordinary contingent causes. I believe indeed, that the fore-shewing signs of the same are decyphered in the Firmament, but not in the directions of the courses of the Planets: Wherefore I account those signs to be irregular, nor to be subject to Astrology; because the significations of those signs are granted by an extraordinary privilege: Therefore the signs of such a plague, are for the most part declared only to the servants of God; as is read concerning *Jonas*: But the signs that went before the destruction of *Jerusalem*, were messages of the Word long before prophesied of; and so neither could the fore-told destruction be hindered, and they were directed only to the meer glory of God, the admonishment of the godly, and the flight of these. And moreover, *Israel* ought to die, and to be renewed by Generation in the Wilderness, except *Josuah* and *Caleb*: neither could that thing be any way prevented: for the Word of the Lord stands unchangeable, with whom there is no changeableness, because he is not like unto

unto man herein. Monstrous signs therefore, if they do not prescribe a condition in declaring (unless *Niniveh* be converted) they by nature promise an unavoidable effect. It hath also pleased others, to draw the births of Monsters into the fore-shewing signs of the plague; even as *Cornelius Gemma*, concerning his Cosmocritics or Divine Characters, doth by trifling, patch them together without a foundation. But who is he, who shall either know, or interpret the denoted fore-tokens of Monsters? For the plague being present, then indeed, and too late, every one draws significations at his own pleasure. And there are some who therefore abhor the coming of unwonted Birds: but that sign either ceaseth to be natural, or that of the Quails fore-going the plague of *Israel* in the Wilderness, shall cease to be a Miracle: And let this be impious and blasphemous; but the other impertinent to my purpose. Others interpret this sign for flesh-devouring Birds, for a future plague; as if they were sent to devour the dead carcases that were to be inhumed; according to that saying, *Where the carcases are, thither are the Eagles gathered together.*

But the Text is not read to be for future dead carcases, neither to have swallowed them down, seeing they are wont to be most carefully buried before others: For the River *Rhoan* at sometime carried away the dead carcases of the plague at *Lyons*; but it infected the Citizens beneath them: at leastwise, the Clergy of *Lyons* declared hereby, that the burial of the dead was to be observed, not so much for the health of the soul, as for the purse.

The coming of Birds therefore, living by prey, denotes rather a future defect of their prey in their own Native Provinces, and they should rather denounce by a monstrous sign, a destruction of war, than an imminent plague. But others divine the plague to be from the meeting with unwonted fishes; to wit, they suppose the waters to be infected with a corrupt defilement, and for this cause, that Sea-monsters do ascend into the waves: surely a ridiculous thing: For if the Sea putrifieth through continuance in its saltness; what water at length, shall wash away the defilement of the Sea? or why shall one only Whale wandering out of his road, feel the hurtful poyson of the Sea? not all in a Shoal, or many together? Truly, I know that the Sea is not subject to a natural contagion of the Pest, and that the monstrous signs of the Heaven, and Sea, are directed by the same finger, of whose unfearchable judgement they are the Preachers, being declared unto his servants only: For the same Lord is present, as well in the center of the earth, and in the bottom of the Sea, as in the highest top of heaven. Indeed all things do alike equally obey him, except the most ungrateful sinner. But surely, I do rather fear the unwonted rains of blood, of spots, or sparks, and likewise Funerals brought down through the Clouds, mournful sounds heard in the air, as also noises in burying places; &c. which things, seeing they are the admonitions of Divine goodness; therefore they are to be referred out of Nature, that every one may seasonably look to the Oyl in their own Lamps: For neither therefore do I esteem those monstrous signs to be the works of the Evil Spirit, but against his will. Truly they are freely given, and above Nature; neither therefore do they belong to my purpose.

But *Paracelsus*, as he had known a singular remedy of the Plague to be in the Toad, and Frogs; so also he writes, that this is presaged as oft as a great heap of Frogs ariseth into a heap, which is to choak some weak or infirm one; which being killed, it afterwards assaulteth another, until the number being thus diminished by degrees, every one at length particularly runs away: which things, if they thus naturally happen; as they prepare a remedy for the plague to come, so also they denote it: For out of a Gaul, even as also from an apple drawn out of Oaken leaves, they write, that for the most part, three small living creatures are drawn; to wit, if it contain a Spider, they will have it portend the Pest; if a Fly, War: but if a creeping Animal, that it fore-sheweth Famine. But seeing one of the three at least, is found every year enclosed therein, if not two, or all of them and yet, one of those punishments doth not continually follow; therefore I refer such predictions among old Wives Fables. I therefore judge, that these kind of Insects do denounce the difference of the Leffas in the Oak (Leffas is the nourishable juice of plants) so as that a worm denotes the aforesaid nourishment to be putrified through continuance; but a Spider, a poyson to be moreover adjoynd to that putrefaction: and therefore as it were a connexed and co-touching Spider is every where almost in the whole compalls of the earth; the which being in the Oak, portends not any thing out of the tree; especially because in the neighbouring and co-planted trees, nor also seldom in the fruits of the same Oak, those divers Insects are beheld at once, in the same Summer: Yet I do not remember that I have found a Spider and also a Fly, at once, in the same

same Oak: although a Fly indeed, and a Worm, also a Worm and a Spider: But far be it from a Christian to prophesie from an Oak, and Terpentine, for that is read to be forbidden by the Lord, with cruel threatnings. But as oft as a new and rare stink of Caves accompanies an Earthquake, or an unaccustomed stink happens in Lakes, then endemical signs have occasional powers. These things of a future plague. But as to what concerns a plague being present, truly I could never by the pulse or urine, even although it were distilled, know the plague to be present. *Paracelsus* indeed, ridiculously enough, numbers it among the diseases of the Liver, and among Tartarous ones, even as elsewhere in a Treatise, and in overthrowing the fiction of Tartars, I have professedly prosecuted. This man attributes an unnamed pulse to the Pest, which he calls a fourth: But I, although I have seriously and often heeded; yet I acknowledge my own unaptness, that I never found such a pulse: But I have well noted about the end of life, an unequally inordinate creeping, and at length, an intermitting pulse: But I have never found a fourth, or a sixth pulse diverse from the rest, from a peculiar bewraying of the plague, but a pestilent pulse different from continual malignant Fevers, hath never offered it self unto me.

The urine therefore, and the pulse, have never, according to my unskilfulness, discovered the plague: yea, while I more narrowly rowled over the writings of *Paracelsus*, I knew that he was never present with one infected with, or about to die of the plague. In the mean time, the judgement of the plague, loads the conscience, as well in respect of the party afflicted, as of the family of the same: because the Pest doth by a certain similitude, resemble a Pretor or chief Officer in a crime, who requires a loss both of life and goods: and so, a rash judgement of the Pest contains a crime: For to have known the plague by the shape of an unwonted Fever, may be easie to another: surely unto me, it hath been very difficult. Thou wilt say, the Pest is with a Fever and headach; but that is familiar unto other Fevers: Vomiting, and the drowsie evil doth oft-times accompany the plague; but that is not altogether unwonted elsewhere: There are in the Pest, Buboës in the groyn, Parotides or little Bladders behind the ears; those signs are not unfrequently proper to Fevers that are free from the plague: There are also black spots in the plague, the which I have seen in women that have been strangled by their womb: There is also a Purple Fever, and likewise leaden Pustules or Wheals, without the Pest: as also a Carbuncle doth oftentimes happen without the plague: But as oft as many of those signs do concur, there is no difficult judgement concerning the Pest: for a Bubo in the groyn, little bladders, or spots, from the beginning, before much cruelty of the plague, do denounce the plague: So also a Carbuncle, or Bubo, and a very small tumour, is far more painful in the pest, than any where else, and they are present almost before the increase of the Fever, and they prevent the suspicion that they sprang from the Fever; so that those miseries of the skin, do go before in the Pest, which in other Fevers happen more late, as it were, the products thereof: a pestilent Bubo, being as yet small, presently and out of hand, existeth as cruel, without pain of the member, and lessening of the Fever, and paineth greatly.

But if a Bubo issue forth after a fore-going pain of the member, it carries the judgement of an unfit remedy: Therefore, they are the ordinary signs of the Pest, being already entertained, if before, or presently after the beginning of the Fever, a Glandule, Parotis behind the ear, Carbuncle, Bladder, Pustule, or spot, shall suddenly invade, and that with the greatest pain: For in other Fevers they do not so notably pain: the place indeed is red, and swells before the malady be bred, which hath not it self in such a manner in the plague: And the Pest is confirmed by vomiting, by an excelling pain of the head, by a deep drowsiness, by a doating delusion, and by a dejected appetite, if they shall suddenly invade.

For the Pest that comes unto one from far, being drawn in through a contracting of the poyson, enters as it were the pain of a pricking Bodkin, and presently, with the greatest pain, marks the part which it strikes, with a swelling, with a wheal, with a little bladder, or with a spot: Even as also, that which enters in by an odour, strikes the stomach and head with a suddain pain, or sleepifying anguish; or stirs up the stomach it self, as it were a spur, unto vomiting: But if it springs from an internal poyson, it hath a fore-going Fever, upon which some of the aforesaid signs do straightway succeed: But that Pest which invades from a snatched terror, is speedy, and is discerned by the testimony of the sick: But that which hath arisen from some kind of terror of the Archeus, but not of the man, and which lurks in the Tartar of the blood, is indeed, in a degree unto the plague, and breaks forth more slowly than is wont, and is easily overcome, unless

lesse the negligence of the sick shall hinder ; yet its delay is the longer in the journey : for, for the most part, the accompanying signs of the Pest are known timely enough, that the remedy which shall be prompt, and which shall be peremptory, may rightly perform its office. Nevertheless it should be my wish, to know the Pest in its making : For that which produceth its signates only after death, takes away a great number from amongst us, and destroys many families ; because it hath already become mortal, before it makes it self manifest, or be known ; because it hath first finished its task, with the hicket, fainting, and an Escharre in some Noble place : For they call this, *the Tragedy of one day* ; therefore a Diary or Ephemeral Fever : Not that the Pest hath the Spirit of Life for its proper seat, although there was never any plague which hath not also infected the Archeus ; and so also, by that title, every plague ought always to be a Diary Fever : But whatsoever of the Archeus is conquered by the Pest, that consequently is by and by separated by that vital Archeus.

At length, that also brings most speedy death, which besieged the Archeus of some bowel ; because the birds of death do continually fly from thence, which trample the rest of the Archeus under their feet : For I wish, and wish again, that we may not know the Pest too late, nor from the event : For a speedy death, although it may produce its own signs, yet it rather profits for the future, but nothing, those that are gone and past. For some, to this end, anoint the soles of the feet with fresh Lard, they apply a Puppy, which if he lick, they perswade themselves, that the chance is free from the plague : But others heat a piece of Lard at the feet of the sick party, and cherish it for sometime under his arm-pits, or in his groyn, and they say, that this will not be devoured by a dog, if the plague be present, which thing deserves no credit : for the plague of man shakes not dogs, nor makes them nauseous : For truly as well dogs, as Wolves, do without punishment, devour the dead carcases that are not well enough buried ; as also Pies, and likewise Ravens. Perhaps indeed, an hungry dog will not eat that Lard which was rub'd on the feet of his Master, because it smells of his Master, whom he dares not bite. But the Germans call the root of the herb Butterburre, or the greater Colts-foot, the Pestilential root ; because as the Pest displays it self before a fore-shewing sign ; so the Butterburre sends forth its flowres before its leaves. The Pest also propagates it self, not so much by a seed, as by an Archeal root. They also relate, that a Saphire of a deep Sky-colour, or Citron-coloured Jacinth, if it abide upon the painful member for a quarter of an hours space, so as that the light from the opposite part of the Gem, strikes the infected place, and there collects its beams, that the place touched on, will wax black and blew within a quarter of an hour, and that it is an infallible token of the plague. But if the place shall in no wise assume a more wan colour, that the sick person is free from the plague.

But I have always in doubtful cases, made use of a powdered Toad, and that boiled in a very small quantity of simple water, in the form of a Poultice, whereby, if presently after, the pain in the Escharre, Carbuncle, or Bubo in the groyn, waxed mild, I safely conjectured that the plague was present. For I sometimes beholding a [Mass] of Prelates and Abbots, and their fingers to be adorned with precious stones, I conjectured, that they were in times past, obliged to visit those that were infected with the plague : But that now also, the Gems of Gems are born about, their use being neglected and unknown, the which I do conjecture.

CHAP. XVI.

The Preservation.

Preservatives according to the Ancients, are two-fold: For some ought to hinder the plague to come; others also the plague being present, that it proceed not to cut down: But for the former, they have devised as well Amulets or Pomanders without, as Antidotes within. But since the Schools have been ignorant of the very essential thing-ness of the poyson; and indeed, that every Pest whether it shall be brought to us from without, or next, shall be bred within, presupposeth the image of a poysonfom terrour; therefore proper preservatives have never been known from a foundation. Therefore among preservatives, I consider,

1. Least the spirit of the Archeus do conceive a terrour in us, or that from a terrour he do not produce a terrifying poyson on himself, or one brought on him within from else-where.

2. That a fermental and co-resembling mummie being brought to us from without, doth not infect the Archeus the internal ruler of our mummie.

3. That whatsoever hath already in contagion become a partaker of the mummie, be killed, and departeth: Therefore the least co-resemblance which it hath common with us, is to be taken away: Wherefore some light poyson is alwayes wont to admix it self with every Antidote; to wit, that hereby the application and approximation may be taken away, that the Archeus may be preserved free from contagion, or that he fall not down into the mumial nourishment, and from thence frame a Tartar of the blood to himself. In this last patronage of safeguard, antiquity hath been wholly vigilant, but it hath not been incumbent about others, because they were unknown:

Although this last preservation hath therefore become uncertain and without fruit; because it hath rather respected the latter product, or seat, than the root or chief cause: when as in the mean time, a preservation from the effect, fore-going conditions being supposed, is fore-stalled as being in vain. Therefore if we must treat of preservatives and antidotes to expel the poyson, as is meet, what things I have already explained concerning the causes, processe, and manner of making the plague, ought to be firmly fixed in our mind.

The Pest therefore either enters from without, and marks the place of its entrance from without, because it primarily affecteth it, or is attracted with the breath, and there passeth thorow the *Diaphragma* or midriff, and causeth a pressute and perplexities upon the very bought of the stomach; and in the same place cloaths the matter, which soon exhales from thence, and becomes infamous in contagion: And seeing that in nature every agent hath its beginning, increase, state, declining, and at length death, it must needs be likewise, that by how much the longer of continuance, and powerful, the corruption shall be, by so much also the more dangerous or destructive it be rendred: For the Pest beginning, is increased with the diminishment and death of the man.

For I a good while believed that every curative remedy of the plague was also of necessity the preservative of the same, because it is accounted a more easie thing to be preserved, than to be cured; Or whatsoever it performeth in the same kind, which is the more difficult, that it should also willingly do that which is more easie: Wherefore I was greatly occupied in times past, with the care of diligently searching into medicines for expelling of the poyson, to wit, whereon the whole satisfaction of my desire then depended: But afterwards I diverted my mind to another belief, and considered that healing remedies had rather regard unto the extraction, or expulsion of the malady; and that such remedies had not place in preservatives for the future; To wit, seeing that which as yet is not, cannot also as yet be expelled, or extracted, yea not so much as extinguished: For truly, first of all, a remedy against the terrour of the man imagining, or of the Archeus, is not in it self so much positive as negative; and so the drinking of pure wine, even unto mirth, preserveth for the future; because it so rules the imagination not onely of the man, but of the Archeus, that the power of forming images perisheth: For so no man is poor,

poor or defectuous, as long as he is cheerful from a drinking of wine: And therefore the holy Scriptures declare, that wine was made for cheerfulness, but not for drunkenness; because it is a powerful preservative: So that although the sturdiness of a man excludeth the terrors from the imagination of the man; yet a manly animosity cannot take away the terror of the imagining Archeus: for the aforesaid animosity or sturdiness of mind, admits of a combat from a contrary opinion of the Archeus: but mirth or cheerfulness introduced by such drink, neither admits of, nor acknowledgeth an enemy, as neither doth it undergo a strife, but excludeth them: But an exhilarating draught is more fit for the Pest to come, than for it being present: Therefore I grant also, that the preservative, and curative remedies for the plague as being present, are of the same company and intention, but not for a future one; yet so, that preservatives of the plague as being present, do not serve, but in the making of its increase, but not in its product being made; because of that which is corrupted, there are no longer preservatives, but onely healing remedies by extirpation.

We must not therefore believe that bad Antidotes, although they were the most potent poisons, could drive away the terror, as neither the pestilent effect of the terror; For truly the poison of the pestilence is irregular and different from other poisons in this, that it issues from the terror of the Archeus, as it were fire out of a flint: For if the Archeus being terrified, yield up the field, verily the body (which being considered in it self, is a meer dead Carcasse) cannot receive comfort. Furthermore, if the Archeus be so considered to retire, that a poison enters in his place, and in this respect shall supplant the Archeus himself, how shall sweet odours and incenses prevent the poison, especially if the very excellentest of sweet smells, are also capable of receiving a pestilent contagion? Therefore let it be a part of Christian piety and compassion, studiously to contemplate with me, how blockishly and unexactly so many Simples have been heaped up together for preserving, and curing; and how much their unfaithful succours have deluded ten thousands of men, and their expectations; because they have every where mocked mankind in a true remedy, by reason of the grosse ignorance of causes: For indeed a curative remedy of the plague being present, presupposeth that which a preservative remedy prevents for the future: Therefore a proper curative remedy is convenient onely, as by slaying of the product (which is the pestilent poison it self) it annihilates it in the matter wherein it resides: In the next place also, another curative remedy being conjoyned with it, is employed in expelling the subject of the poison it self, which is to be attempted by sweat: Moreover, a third is that which takes away and lessens the co-suiting of causes unto their products, the which also hath in it the nature of a preservative. The Pest therefore which is drawn in from without, from an infected body, garment, or place, hath indeed in it, an absolute and formal pestilent poison, which presupposeth not a fore-existing fermental putrefaction, and therefore it suddenly invadeth with no fore-going complaints, and it utters future signes, but onely it hath need of an appropriation; which kind of preserving in making of the Pest, a rectifying of the air, familiar to *Hipocrates*, containeth (of which in its own place) no otherwise than as in a popular plague; To wit, that the poison it self in the air may be killed, and the air also, originally so disposed, that it suffers not the nourishable humour to be mumiably corrupted; or to snatch unto it a fermental putrefaction.

These things of a remedy for the future: Otherwise, when as the pestilent poison is now received within, it lurketh, and is unknown, and also is fitted and sealed in the Archeus; and that by reason of the singular swiftnesse of its poison: But then, defensive remedies alone do come too late, unless they are also healing ones. First therefore every cure of preserving, is busied, that the body may be always actually hot, and kept in transpiration, and that the mind may be disposed unto a cheerfulness opposite to terror; even as I have already before cited concerning wine out of the holy Scriptures: But what thou readest concerning the rectifying of the infected air, it hath respect not so much unto the air, as to the points thereof, to wit, in whose vacuities or hollow empty spaces, the vapour of contagion sits or floats. Furthermore, those remedies which take away a putrefaction through continuance, and poison out of the air, but terror out of the mind, and lastly, mumiial co-fittings or suitable conjunctions out of the body, these are preservatives: For the perfumes or suffumigations of *Hipocrates*, freeth not onely the encompassing air, but also the air that is attracted inwards, yea, and the co-agulated vapour from the poison, and together also from a fermental putrefaction, no lesse then as it hinders the mumiial ferment from being applyed; to which ends also, Antidotes, Zennextons or external preservative Pomanders do conduce, which are able to kill the

image of terrour, and pestilent poyson, in the proper subject of the vapour, or Tartar of the blood; and in this respect also, to divert and hinder the terrour of the *Archeus*.

But if indeed the Pest be conceived by a proper error within, other preservatives are required, than when as we must live about infected places, or persons: But the plague being formed, moves the same to go with a speedy course in a retrograde order, from a poyson formed, unto a corruptive vapour: Therefore also neither are amulets or preservative pomanders occupied about an inferiour and remote preparation of the pestilent matter that is to be averted; but for the overcoming of the formal and ultimate poyson, and suiting of the *Archeus* with the Tartar of the blood, in the one extrem, and in the other, with the poyson drawn in: And so an amulet keeps a curative betokening in preserving; yet it is exceeded by a curative remedy in this, that healing remedies ought not onely to kill the poyson; but also to thrust it out by sweat: Indeed both betokenings ought to concur in curative remedies: For otherwise, in vain doth the body flow down with much moisture of sweat, if the Tartar of the blood be not resolved; but is rather continued by the continued terrour of the *Archeus*. Truly the causes, as well the constitutive, as the occasional one, being known, afterwards the indication or betokening of things to be done, consisteth onely by the conduct of reason: For if a fermental putrefaction hath given a beginning unto, and caused the first disposition of the matter, places putrified through continuance, as also nourishments easily putrifying, are to be avoided.

An open air is healthful to healthy persons, because it hath the power of an elementary consuming; but the air as it is such, doth no lesse obey contagion, than other bodies, and it containeth in its own Magnal of the air, as it hath hollow pores, the whole contagion; the which at length by pining away in the same place, doth for the most part die, not but of its own accord, in the space of 40 dayes; and by an elementary power is spoyled of the poysonous seed of a ferment: For the seeds of things conceived, do by little and little decay in the air, as they being shut up in the hollow places of the air, as it were in wombs, do return to the last disposition of corruption, and the first generation of watery matters. All sorrowful things also, are to be removed, not onely because they are near unto fear and terrour, but especially because they do forthwith produce a sensible fermental putrefaction (the mother of sighs) about the mouth of the stomach. The places therefore, and objects of a sorrowful remembrance, as also such fellowships, are to be avoided, no lesse than sorrowful messages, and discourses of History: Exhilarating Wines are to be drunk, as also the more strong Ales or Beers; because that by causing carelesnesses and animosities, they shake off grief, and terrours: But the cold air and winds hurt those that are infected, yea that are fearful and sorrowful after any manner, or whatsoever is opposite to exhalation and sweat: A washed house doth now and then indeed take away the fermental putrefaction and contagion; and the watery vapour hurts those that are infected; therefore it were first to be dried. Forty dayes shutting up, although they may increase the fermental putrefaction; yet they take away the pestilent poyson, as it perisheth of its own accord in that space of time: Perhaps therefore custom hath brought over those Quarantines or forty dayes enclosures, for any renovation whatsoever: For although swimming, or cutting of a vein, may seem to diminish the fermental putrefaction; yet seeing nature hath laid up the blood for her treasure; it follows, that as oft as she shall perceive the blood of the veins to be taken away, the *Archeus* as it were fearing treachery, is disposed unto terrour, and draws the rest of the blood inward to himself, and by consequence also, it calls the pestilent poyson together with it, into the inner chamber; which motion is diametral with, or directly opposite to sweat: And therefore, let as well the cutting of a vein, as swimming, be destructive; also all loose solving of the belly is to be avoided; because so, the more crude blood of the meseraick veins is made to putrifie through the ferment of the solutive medicine (even as elsewhere in the book of Fevers) to wit, at the evacuation whereof, the meseraick veins do fetch back blood out of the hollow vein, and this out of the small branching veins of the body; which motion is diametrically opposite to the curing of the plague.

Those things which I have hitherto spoken, are of the number of negative preservations, or they are admonitory rules of things to be avoided, which rules do not, yet, contain health. But among positive preservatives, Amulets challenge the first place to themselves, which obtain a proper faculty, whether it be for killing of the poyson, or else for preventing of the mumial appropriation of the *Archeus*: Both of them indeed are curative in the making of the Pest. Next a sudoriferous one follows, which is a rooter out of the plague, and of its seat, by washing off. Again, the *Archeus* being grieved and affrighted,

affrighted; straightway betakes himself inwards, fleeth as it were to his Castle, begets sorrow and sighings, and the enemy being received within, increaseth venomous perplexities: Therefore he is to be called forth unto delights, and by sudoriferous medicines: For sudoriferous or sweat-provoking remedies, are all of the same intention, and almost of the same weight, but at leastwise they differ in the degree of goodnesse. In the next place, in an Antidote being adjoynd, I praise the potion of *Hippocrates*, whereunto I adde Ginger, and the black berries of Ivy; because they are Diaphoreticks which are acceptable to the stomach. Also antidotes are to be given in generous or rich wine, and that presently after food, not indeed so much that the sick party may sweat, as that his body may be kept in transpiration: But let the food be light, and little; for in every fever, and rather in the plague, digesti on faileth; therefore let the more pure drink supply the room of the more large food: For pure or unmixt wine excludeth fear, cares, sorrow, and terrour; And therefore also the chief preservative is established in confidence.

Indeed I do not here speak of Christian faith or confidence (although in Spirituals, there is every where matter of great moment) for they also who lay down their life for the sheep, do now and then die of the plague, other carelesse persons remaining safe: For their confidence hath either a defective rottenesse within, or some other obstacle; The Lord not working miracles, but for his hidden Judgments. The faith or confidence therefore, of which I speak in this place, is the natural mean of animosity or stoutnesse of mind, fighting against, and strongly resisting terrour; neither is that faith positive I believe, but altogether negative, not abhorring, not fearing, yea neither therefore believing that he shall be infected: For as a pestiferous terrour hath a suspicious and fearful faith annexed unto it, that they have lately conceived something of contagion, or do feel a murmuring about the mouth of their stomach; so the preservation thereof is a belief that they have conceived nothing: neither therefore is it sufficient that the confidence be not terrifying (which is a mean between terrour and animosity) but it is required that it be operative, by not believing that they shall be infected: And that not by an inducement of reason, but altogether by a free power of animosity, and the meer motion of confidence: otherwise, children and mad-folks, although they have conceived no terrour, yet they oftentimes perish by the plague, for want of an operating confidence, which frames a preservative to it self: For not to believe that one shall be infected, works far more strongly than the presumption of fear, not onely because a negative destroys more strongly than an affirmative builds up; but because it together therewith, contains a privation, which is stronger than every positive: For we are those who proceed from an infinite nothing, and therefore our nature doth more strongly apprehend nothing, than something it self, from whence also it obtaineth rest to it self; even as is to be seen in negative Syllogisms, wherein the conclusion follows the negative, and forsakes also a particular affirmative connexed with it, that it may bring it self into quietnesse by a denial.

For truly, the understanding being now degenerate, and naturally distrusting it self, in understanding [this something] of things, had always rather lay down in not knowing, or not being able to know: And that is the cause of sluggishness in Sciences: Therefore the belief requisite in terrour, for preserving, is positive, and therefore it ought effectively, actually, and efficiently to stand; although with hope it concludeth negatively from the weaker part. A good man, in readily serving those that are infected with contagion, if by reason of the piety of his work, he hopeth and trusteth more in the goodnesse of the work, or of desert, than in a free valiant confidence on God, he hath a faith con-joynd with hope, and it includes an agony of fear and terrour: Therefore he naturally undergoes an infection, unless he be preserved from elsewhere. But the confidence of this place is drawn, not so much from Saffron, or the exhilarating things of boasters, as from the cheerful drink of the more pure wine. Women with child, also women in child-bed, or menstruous women, because they are then more restrained under the command of their womb, than under the conduct of the universal Archeus, therefore they are the more dangerously oppressed with the Pest: For truly, the Archeus of the womb doth no way obey reason, or confidence, which is wholly vexed with confusion, and a sorrowful troop of disturbances: Therefore the womb is to be comforted with the oyl of Amber, and with Amber dissolved in the best spirit of wine, and with the suffumigation of the warts of the shanks of a horse, being beaten to powder in a mortar:

CHAP. XVII.

Zenexton, that is, a preservative pomander against the Pest.

VHigh confidence, as it were the principal pledge of animosity, and mean of preservation, that the Schools might stir up, the succours of idols, purging sacrifices, and exceeding mad Idolatries have been Antiently devised: Things also were hung on the body, and carried about from without, which afterwards, in every religion were accounted for holy things, and the which, were even falsely believed by an hidden (because an unknown) goodness, to repel terrour, and sorrow. A Zenexton therefore, seeing it hath for the most part, been devised for prevention of the plague, and doth also compleate a part of the cure; therefore it deserves a singular consideration.

For Physitians have described diverse such preservatives, according to the desire of every one, that they might readily serve for a comfort to the sick, while themselves were fugitive helpers: They decree also, that Amulets are to be hung on the body, the which, although for the most part, they could have nothing of virtues, at leastwise that they may from a ruinous foundation, perswade others unto animosity; to wit, unto a belief, hope, or some kind of confidence: For the *Pagans* at first commanded the Images and Statues of their Deastors or starry Gods, to be carried about the sick: and then they came unto characters, words, seals or tokens, and to the *Talismanicks* of *Gamah:u*.

Afterwards the first Monks of the Christians, offered labels, and things to be hung about the neck, against the plague: and from that foundation, they perswaded the vulgar, to believe that the Pest was a stroak immediately sent from God. I meditate therefore, that every natural work ought in nature, to follow its own means, as oft as all things requisite for operation are present: Therefore I enquire in this place, into the fixed, firm roots, into the necessary and ordinary causes, for the obtrayning of the effects correlative to such causes. Others therefore interpreting the Plague to be a punishment, have proposed unto people, unutterable names, writings, signates guarded with meer vanities, also polluted with insignificant words, in bearing them about; whereunto perhaps, they have joyned a verse of *David*, of *Salomon*, or of some Prophet. But *Paracelsus* laughing at these vanities, devised other greater ones, especially those adorned with two characterisms; yea and with lying seals; and he again consents to those, which elsewhere, he derided with much Taunting: But I have at sometime frequently noted, a sometimes ready sliding into hypochondriacal madnesse, from these superstitions: Besides these, there are some who forsaking divine names, do commend figures, lines, characters, words, the figures of numbers, and according to the pleasure of Astronomers, the feigned seals of the planets (to wit, the errours of the wandering stars) under the name of *Pythagoras*, of *Salomon* the Jew, or some other, they hitherto attributing more to the toys of the heathen than to any sacred imprecations: For if happily any one who had saluted him that had the Pestilence afar off, and had remained free from contagion, he now being the Authour of trifles, had made it his priviledg of deceiving two thousand people afterwards by his toys: For truly, I have taught there is no Astral thing that in the Pest, as well in the manner of its making, as of its curing: For I alwayes reject unfaithful, trifling means, and especially those which are unlawful; because none that leans upon a Staffe half broken, is preserved from falling, unlesse it be by chance: For although the terrour of the man be put off by vain remedies) which otherwise infants want) yet they are not therefore deprived of the terrour of the *Archens*: Indeed they exclude onely the effect of faith privatively, when very much, and that onely for a little space, and they oft-times forsake their own confiders: for why, since they are known to be of no power. For *Paracelsus* always made an heightned imagination, and strong confidence of great account; the which when as he floating as loose and frivolous, I found to be founded on the sand, I could not approve of, and that follies do contain a succour of preserving from the plague. *Paracelsus* scarce trusting in mental trifles, converts himself unto a Zenexton, which would undoubtedly preserve him that carried it about him, from the Pest:

But

But since he describeth not that preservative *Pomander* for the City of *Sterizing* that had been bountiful unto him, right would make us to conjecture, whether as ungrateful, he deceived that City, or whether indeed, he were ignorant of that *Zenexton*. Surely a remedy is in no wise to be hidden from mortals, in so great a destruction; especially, from whence he might hope to deserve honour to himself among those that are present, and all posterity. Men have been diversly mad about this thing; for every one hath persuaded himself that he hath caught the boasted of *Zenexton* of *Paracelsus*, by the ears; and that thing hath so greatly pleased mortal men, that thenceforth they have exchanged names, the Amulet of the *Greeks*, with the barbarous name of *Zenexton*: for very many have carried Arsenick, Orpiment, Quick-silver, yea and Mercury sublimated, and such like poysons of the veins about their neck, or the pulses of their veins; no otherwise than as if the Plague, and Lice were chased away by one and the same remedy. But these kind of inventions being brought unto us out of *Italy*, which is fruitful in presumption, juggling deceits, and subtilties, we strangers do adore and follow: For as posterity willingly boasteth, that it hath drawn the first rudiments of discursive Sciences from the *Greeks*; So also, it hath hoped to learn the properties of poysons more readily from none, for the varieties, enlargements, and maskings of death, than from a Nation frequently imploring the help of poysons; for it hath believed, and falsely persuaded it self, that to hand forth poysons, and to cure the Pest, had a neer affinity: Therefore our Physicians returning from *Padua*, with worship and reverence toward their Professors there, some opinionating these men for their great learning, have hung Quick-silver enclosed in the shell of a Filberd Nut, about their neck, and they supposed that they were safe, whom, when others saw to die, they married the former Quick-silver unto Arsenick, a Spider or Scorpion being added thereunto; some whereof, inscribed sacred words on Trochies prepared thereof; that if one should the less successfully profit, the other at least might help.

But I have seen in the Camps of *Ostend*, nigh the shoar, many thousands of men with such a *Zenexton*, the plague being removed; yea, and those who for every fifteen daies, embladdered their ribs by Trochies of Arsenick enclosed in fine linnen bags; and those are the medicinal Tragedies, the final periods of an Italian Imposture. Moreover, the Jews and Heathens, to wit, these from ignorance, but the other from a sworn enmity against us, do sell roots at a dear rate, to be born about by us that are rash of belief, as being deluded by a hope; and they feign that first *Moses*, and afterwards *Solomon*, successively delivered those secrets by the Cabal, delivered unto their Fathers the *Rabbins*: As wicked *Josephus* himself, in his eighth book of the Jewish Antiquities, Chap. 2. notably feigneth, concerning so many thousand books of Enchantments described by *Solomon*, no otherwise than as he malignantly concealeth the death of the little innocent Babes under *Herod*.

Lastly, our Physicians, after that they beholding the disproportion of events, and promises, described sweet perfumes, and grateful odours, in apples, powders, and bolsters, and sponges continually smelling before their nostrils, they hoped that they should strain the air of the Pest as it were thorow a Sieve, from the exhalation of the Spices, and so should kill or correct the poyson with the odour that was plausible unto them: as if the poyson should cease to be filled with the Spiciness, and should not enter the more fully, with the grateful odour its companion, and as if sweet smelling things themselves were not subject to contagion; as though Arsenick, or Wolfs-bane, being married to Amber-grease, should cease to hurt! as if the most odoriferous wines should not be presently defiled with a hoary putrified Hoghead! at leastwise I gratulate my own soul, that it hath never been ensnared with such childish delusions. Wherefore, an Amulet is founded not indeed in an excited imagination, or belief (because they are those, which are the expert souldiers of another Monarchy) but altogether in an actual endowment conferred on things by the Creator:

First of all therefore, it is manifest from the premises, that sweet smelling things, gold, gems, Chrystal, and whatsoever things are able to draw an odour, are able also, by the same Law, to be defiled with the Pest: Not indeed, that I do altogether despise the medicines of the same not being infected; far be it: For it is one thing to dispute, whether any thing be capable of receiving contagion; and a far different thing, whether any thing can help those that are infected: for I have taught, that wine doth preserve from a future contagion, which otherwise, is in it self so defileable, that it brings the plague only by its touching, and drinking: But in a *Zenexton*, there is altogether another method, condition, and property required: for a preservative Amulet requires, that in it self it be wholly undefilable

undefileable, if it ought to preserve for the future : and it is distinguished from other preservatives by that condition, from whence indeed it is known, what sort of Zenexton is to be chosen, and what kind thereof is unfaithful ; the which I desire that thou thus understand : The Pest of *Oxen* is not that of dogs, or of falcons, and none of these is that of men ; Yet the skins, or fleshes of bruits may be defiled with our Plague, as that they may be pestiferous contagions unto us, although not unto them ; Because the pest infecteth in an appropriation, or mumial co-resemblance : Although the plagues of the last times shall take away from amongst us, not onely men, four-footed beatts, birds, and fishes, but also trees ; and therefore they shall be of another and more cruel disposition than modern plagues, which issue out of the bosome of nature : and likewise we are instructed by the aforesaid particulars, that the Archeus of man, and of all bruits, have now and then alike dreadful fears, and that the characters or impressions of these, are formed into a pestilent poyson, or poysonous idea ; whence it manifestly enough appeareth, that the plague is not a poyson alike with others ; For truly wolfs-bane, the viper, &c. do kill oxen as well as men : Therefore in beginning our Zenexton or preservative pomander from stones ; The Saphyre of a deep skie colour, and the Jacynth full of a yellow golden colour, if it be leisurely rouled into a circle about a Bubo in the groyn, and a pestilent Eschar, by drawingly bringing it about from the region of the Sun, or light, it causeth, that the same circle do afterwards become black, and that the rest of the poyson doth exhale out that way, as it were through a chymney. Also if there are more glandulous knobs elsewhere, yet these do settle down, and perish together, and do follow at the departure of the drawn poyson : but I prefer the saphyr before the jacynth ; For neither is a saphyre in vain read to have been in the breast-plate of the Priest, and the jacynth to have been excluded : For a Zenexton was anciently, alwaies attributed to precious stones, and heathenism soon ingraven figures, numbers, and characters thereon : but since gems were not for the poor, for whom notwithstanding the vast goodnesse foreseeeth with a large showre before the rich, and hath offered himself freely to be the father of the poore, I am not easily induced to believe, that these Gems are the true Zenexton of the plague.

A Chirurgion of *Spain*, whose Sir-name was *Guardiola*, being chief Chirurgion of the Hospital of those that were infected in the siege of *Ostend*, shewed me a piece of red Amber, which he said had been his one onely preservative amulet for full three years space : The secret whereof was, to wit, that it had been rubbed on the seven principal pulses, even unto a heat, namely, on both the Temples of his head, on his wrists, ancles, and on his left pap : At leastwise, I saw him to have been alwaies preserved, his other co-assistants being taken out of the way : But the Pest was on a sandy shoare, and that for the most part molested with a windyskie, and with colds being exceeding destructive and cruel : But that which I find to be in amber, is not altogether to be despised : first of all there is in it an attractive faculty manifested and stirred up by rubbing on the place : and then, amber, although it be in it self transparent and gummy, yet it is the lesse strictly closed, and therefore is the more easily moved and altered by our heat. Again, neither hath amber a limited power of drawing, such as the loadstone hath, which allureth iron, and not copper unto it self ; but a general one, and that without choice, so that which is drawn be light : Indeed it is sufficient for drawing of the pestilent air, and poyson, if it shall draw any light bodies whatsoever unto it self. The signate or token therefore of this attraction, denoteth a preservative external remedy founded in nature ; and so much the more strongly, if it hath obtained an appropriation with a mumial ferment : For so I have oftentimes seen, that by amber dissolved in the spirit of wine, cures of poysoned wounds have been wrought, they being otherwise altogether desperate ; Yea, even as amber dissolveth not, being co-melted with other rosin, or fat (which denotes some singular thing to be homebred in it) surely it demonstrates that the strange fable, and tumult of *Phaeton*, and that the name of *Electrum* or choice remedy, hath not vainly been co-incident unto it. Let him laugh who will at the rubbings of amber on our pulses ; let him run back unto *magnum oportet*, and at least he shall admire at the rubbings of apples for the abolishment of warts, not without fruit : For truly, if a towel being rub'd on a pestilent Bubo, doth snatch to it, and propagate the contagion ; why may not also frictions or rubbings for a good end, bring a mumial co-suiting of disposition ? who, I pray you, may not suspect amber that is rub'd on a pestilential emunctory : and if the poyson, why also by a like processe, is he not, at least in doubt, that it hath contracted a mumial co-resemblance ? For I remember that

cheese

cheese being carried about under the armpit, and swallowed by a dog, it served instead of a snare or bait, and that he so left his own Master, that he believed him to be carried away by a stranger in a ship. Truly if brut beasts, will they, nill they, do feel this limitation of the mummy, and do obey it, yet they enjoy a much more free choice, than those things which from an Archeal conception, fall under a Zenexton; I see not why it shall be wickednesse, to have attributed the same limitation unto Amber: For it is a thing that grows unto admiration, being in times past brought unto us for the rosin of a tree; at length being believed by others to be a mineral: yet is it sweated out of the *Danish* sea: At leastwise nothing is more acceptable to the stomach, bowels, sinews, yea, and to the brain, than amber being dissolved in the spirit of wine. Cease thou therefore to wonder, that so singular an increaser, being also endowed with so singular a comfortative and preservative faculty, and signed with so singular and attractive a faculty, is able to root out the Pest from our places and members, for the comforting whereof, it grows by a singular goodnesse of divine providence: For neither doth it savour of all unlikelihood of truth, that amber doth by rubbing, attract an odour, by reason whereof, it is rather appropriated to this individual than the other: For it is plainly a porous and volatile Gum, and therefore the receiver of a mumial odour, which it received by rubbing: For I have known a method, whereby the virtue of an herb, and animal, is imprinted on precious stones; and so that however exactly they are washed afterwards, yet the imprinted faculty remains resident and safe: For a yellow Topaz, as through a moderate heat of ashe, it looseth its yellownesse; so by the heat of the Sun it recovereth the yellownesse which it had lost in the ashes, through the same degree of heat.

Red Coral, by rubbing it on a woman that is sick of her womb, contrasteth a remaining paleness; but if it be rubbed on the flesh of a healthy woman, it recovers the ancient rednesse of its brightness.

In the next place, glasses (the most closed or shut up of solid bodies) wherein the essences or Magisteries of Civet, &c. had been; I have seen to have kept those forreign odours after repeated and tedious washings; yea, and a glasse, so to have kept the attractive power of a loadstone, because a magistery of the loadstone had been framed in it. If therefore such things are wrought in a glasse, why not also in amber? which by reason of its porous and volatile matter, hath it self in manner of a hoghead, which being new, reserves the odour that once seasoned it. Therefore it's no wonder if amber retain seasoning odours, especially if it be born about by the same person, whose mumial exhalations it received by friction. Nor also is it of much concernment, if it divorceth the testimonies of the nostrils: For we also do not discern by a footstep; whose footstep it may be. For if the holy Scripture do commend a great virtue in stones; they do not understand that, of dissolved stones (for the art of resolving them was not as yet then commonly made known) nor of the powders of Stones being drunk; the virtue whereof, being not co-mixed with the dungs, but for a little while, slides away in passing thorow the body. Therefore the speech is of entire stones, which ought to be as well the attractives, as the expulives of the malady, and therefore their virtue is commendable for a Zenexton. If therefore a stone hath great virtue for the use of man, and the hardest of precious stones themselves, are by the testimony of the wise man, fruitful in virtue; that must needs happen, by beaming into the body, which they touch at, well nigh, like unto the stars: and therefore also, amber, through its irradiating transparency, and a more inclining obedience of effluxing, shall in no wise be more sluggish than gems: and the faculty thereof, which otherwise sleeps, as it were bedrowsied, no wonder if it be stirred up by rubbings and heats; especially because an Adamant or Diamond, although it lose nothing of it self, yet by rubbing, it also allureth chaffs: For neither doth amber draw chaffs or moats, unlesse it be first rubbed: For it is a signate, teaching, that frictions ought to go before, if the bedrowsied power thereof ought to be stirred up by a wakening it out of its sleep, and to influx its ordained office of succour into us. At leastwise I testifie, that a piece of amber, as it resembles a gem or precious stone, yet can be much more easily attained by the poor man, than precious stones.

And moreover, *Paracelsus* highly boasteth of the invention of the magnet or loadstone of man, whereby he supposeth, that the Pestiferous air is uncessantly introduced and so he promiseth more powerful virtues to be in his Zenexton, of drawing outwards, than there are belonging to our feigned magnet of drawing inwards: But surely, that man hath seemed to me, to be little constant unto, and little expert in his own doctrine concerning the Plague divulged in so many books, to wit, while he maketh the heaven to be the

Archer

Archer of the plague, and that this plague is nought but a wound of the heaven, as an angry parent; which thing, if he judgeth to be true, that poyson at least is nor drawn by our Magnet, which is darted into us from so many thousand miles space: and either the Magnet is undeservedly accused, while as it is without fault, and his *Zenexton* is in vain directed, and hung on the out-side of the body, against the drawing of a feigned Load-stone; or he understood not the causes of the appropriation of a *Zenexton*, or at leastwise, he might think that he had dictated but dull causes of the Pest. To what end therefore, doth the remembrance of that Magnet conduce in this place? the praise of that invention? For truly, a *Zenexton* hath nothing common with that Magnet, nor against the same: Be it so, for let there be a Magnet (let us grant it by supposing a falshood) in the heart and arteries, which without distinction drinks in the pestiferous poyson mutually co-mixed with the air: But if a *Zenexton* takes away, or hinders this Magnet, now the man is of necessity choked, as being deprived of his accustomed expiring, for the necessities whereof, they will have the heart and arteries to be uncessantly tired or urged: But if indeed we had rather have a *Zenexton* to be a separator of the pestilent air from the pure, that word containeth something befitting a Fable: because the *Zenexton* should at least undergo the office of a Sieve, and Seperator, and supply the room of the *Archeus*: But if a *Zenexton* causeth, that our Magnet draw nought but what is lawful; then the *Zenexton* should be the Tutor and School-master of the *Archeus*, to wit, that he may rightly perform his office; unless happily, thou hadst rather have a *Zenexton* to be distinguished by the name of an office alone, and so it should be equally infected with the *Archeus*, and equally feel the contagion of the Pest; yea an external thing, forraign to the life, and perhaps containing a poyson, is now assumed with the Etymology of a due *Archeus*.

Alas *Paracelsus*, the matter is far otherwise: For it grieveth the *Archeus* of his own government: for neither is he intent upon fighting, or separation, in the Pest, who himself is the only object, and one only workman of the poyson: But he prepares himself for flight, casts away the rains, as being full of a panick fear, and as being mindful of his own weakness, that he is wholly subdued by poysons, or the least infection of an odour, by the biting of a Viper, or stinging of a Scorpion in the top of the finger: Therefore he refuseth discretion, and being affrighted at the beholding of his Enemy, opens the doors, and casts away the keys behind him, and presently admits of any one to govern: and so, whatsoever things do happen in a dead carcass, after death, are in their making at the coming of the Pest. A *Zenexton* therefore, only serves, not indeed for admonishing the *Archeus* of his duty, and appointment, nor for dividing of the poyson from that which is harmless in the objects, much less for restraining of the natural attraction of refreshment; but that it may kill, and annihilate the specifical poyson, which is conceived as well in the external air, as within in the *Archeus*: But surely none of these hath need of a Magnet, nor doth any way respect a Load-stone. The invention, and end of a Magnet, in a *Zenexton*, was unknown by *Paracelsus*: For a preservative Amulet, for every event, if it should respect a Magnet, it should not be of value, but in the case wherein the pestilent air is drawn inward through the arteries (which I have elsewhere demonstrated to be frivolous in the Treatise of the Blas of man) but not, if at any time it be brought by the breath, as neither where the pestilent poyson ariseth within: Therefore the unknown *Zenexton* of *Paracelsus*, doth in no wise satisfie the necessities of Nature, or ends of healing.

But *Hippocrates* hath seemed to have more neerly beheld the causes of necessity for a *Zenexton*: He willing, that the heaven should make three local motions in us, to wit, within, without, and circle-wise; he then naming the heaven, as yet by an undistinct Grecisme, for the vital faculty: From whence Successors thought, that the heaven is contained in us in a motion outwards, by a transpiration, that a forraign Pest by that which is breathed in, may be hindered: For they say something, and from an unmindfulness, that the bodies of the infected are preserved in transpiration: But the same doubt, and antient perplexity, remaineth about breathing, and the framing of an internal plague: and in my judgement, a *Zenexton* ought not to lock up the pores, nor to shut the doors of breathing, least the Enemy enter; nor to strive with the *Archeus*: for strifes, discords, and brawlings, if ever before, at leastwise while the plague kindleth or rageth, is unreasonable; especially, while the *Archeus* failing in his courage, casts away his weapons.

In the next place, neither must a *Zenexton* be intent in the more outwardly separating, costing, or preparing of the pure from the impure. But that it be wholly, after the manner

ner of an Antidote, contrary to the poyson already received: not indeed properly against the poyson it self: But seeing that its principal use is in preserving, rather than in curing; Therefore the virtue required in a *Zenexon*, most properly consisteth in this, that it takes away the muniial appropriation and suiting, without which there is no contagion made: neither yet should it be a strange thing, if besides, it hath obtained the powers of a medicine to expel the poyson. And moreover, *Paracelsus* relates many things concerning frogs, and toads, for the Pest, yet all of them confused ones. In the mean time, he hath opened the earnest desires and eyes of many: For he affirmeth that toads are convenient for women, even as frogs for men, and indeed he would have them to be hung up and dried, and a stick being thrust thorow their head: He hath chosen no month for this act.

At length, he promiseth that a Toad thus dried (but having prosecuted nothing of Frogs) being applied to a Bubo in the groyn, will so draw all the poyson of the Pest into it self, that successively, even unto the fourth or fifth Toad, they do all wonderfully swell: and so he conjectureth at the quantity of the venom by the number of the Toads. He will also have the dried Toad to be first steeped and mollified in Rose-water: Notwithstanding, either *Paracelsus* is unconstant to himself, or he chose some other *Zenexon* to himself besides the Toad: For truly, he writes, that the Toad is prevalent only in the Pest of the groyns, and of women: But for other plagues, he useth other attracters; and he saith, that the chief Incarnative of the Coelestial wound (for so he calleth the Pest) is gold, and precious stones.

First of all, I confess, that I have applyed Toads unto Buboes, and Eschars, as well in the breast, head, paps, as elsewhere, as well in men, as in women; and every where, not without a ready succour, and mitigation of the pain: But first of all, I never saw an applyed Toad to have swoln in the least; the which also, I therefore afterwards held to be ridiculous. And then, that of *Paracelsus* is alike frivolous; to wit, that the Pest doth no where otherwise offer it self, than behind the ears, under the arm-pits, and in the groyn; because the heavenly Archer doth not smite in any other place: For truly, I have seen a true and mortal plague to have shewn it self every where in the whole body, not only by Eschars, little bladders, Pustules, and swellings, but also by spots and marks: Therefore *Paracelsus* supposed the same thing to happen unto a dried Toad, which befalls a live creature that hath taken poysons, and that is stung by Serpents, or that is killed by the poysons of plants, and animals: as if the plague of man should be a poyson to the Toad; and if this should happen, the Toad should not command the Pest, but the Pest the Toad: Neither also, doth a dried dead carcass feel what were poysons unto it, while it was alive; Nor doth a dead carcass swell, being smitten by a Serpent: For a dead carcass, if it shall not be sensible, neither hath it retained the efficacy of tumefying. Therefore *Paracelsus* was ignorant, that to swell up, is the property of the vital *Archeus*, and that swelling proceeds not but occasionally, from poysons. I admired at the insolent boldness of *Paracelsus* writing this thing; for a Toad that is dried, however he may be six hours steeped, yet he always is incapable of tumefaction or swelling: For the delay of steeping in a swift disease, is full of danger and loss; I therefore have steeped him in a small quantity of warm water, who being applyed unto the paining place, hath presently asswaged the pain. Truly, if any thing should expire out of us into the dead carcass of a Toad, which was there materially detained, it had breathed out the same way whereby it had entred into the Toad: therefore swollenness is the action of the *Archeus* of life efficiently, and effectively; but it is the occasional action of the poyson, and the which therefore, can be none on the *Archeus* of a dead and dried Toad: The *Archeus* therefore, since he is wanting to a dried Toad, cannot be the cause of swollenness in that Toad: For poyson ceaseth to be poyson in respect of a dead thing; seeing poyson bespeaks a relation unto something that hath life. I know that *Paracelsus* had no actual practise of the plague; indeed, that he hath written many things, and those little suitable thereunto, he having promised most things from a rashness of belief drawn from the relation of others.

Butler the Irishman, to my knowledge, had cured some thousands at London, of the plague, and afterwards, through the accusations of enemies he being detained in the Castle of *Vilvord*, by my assistance obtained his liberty: For he had commanded a great Toad to be taken after noon-tide, in the month [called] *June*: I hung him up by the legs nigh the chimney, and set a dish of yellow wax under him: At length, after three days hanging, the toad vomited up earth, and some Insects, to wit, walking flies, their wings shining with a greenish colour, as though they had been gilded: But presently after

G g g g g g

vomiting,

vomiting, the Toad dyed: neither vomited he up any thing before three days space, although he hung with his head downward. But he said unto me, that I had remedy enough for the curing of forty thousand that were violently taken with the Plague, and promised that he would shew me the hinge of the matter: But being suddenly banished, he departed.

At leastwise, I commanded these excrementitious filths-cast up by vomit, and likewise the dead carcase of the toad being dried, to be beaten apart, into powder, and with Gum dragon, I formed Trochies, which I have successfully used, as well for the prevention of the plague, as for curing of the same. Afterwards in the month [called] *July*, in the decrease of the Moon, I took old Toads, whose eyes abounded with white worms, and hanging forth with black heads, so that both their eyes were wholly transformed into worm; perhaps there were fifty worms in number, thickly compacted together in every hole of their eyes, whose heads hung out; and as oft as any one endeavoured to go out, or to hang over, the Toad presently, by applying of his fore-foot, forbade his utterance: But these Toads being constrained to vomit (as I have said) by hanging them up by the legs, I found to afford a most excellent *Zenexron* or preservative amulet against the Pest: But I reduced the wormes falling down in the waxen dish, and together with that which he rejected by vomit, into smal Trochies, the dead carcase of the Toad and waxen dish being added thereunto: But the Trochies being born about at the left pap, drave away the contagion, and being fast bound to the place infected, presently drew out the poyson: And the Trochies were more ready, and of more validity if they had returned diverse times into use, than when more new: But I found them to be a most exceeding powerfull Amulet or pomander for the plague: For if the Serpent eateth earth all the days of his life, because he was the instrument of sinning; the toad eats Earth which he vomits up, all the days of his life: But according to the testimony of Adeptical Philosophy, the Toad bears an hatred against man, so that he infects some Herbs that are usual with man, with his corruption, and that in hope of his death: But he differs from the serpent in this, that at the sight of a man, he from a natural gift conceives a great terrour or affrightment; which terrour from man, attains for, and imprints on himself, a natural efficacy against the images of the affrighted Archeus in man.

For truly, the terrour of the Toad kills and annihilates the Idea's of the affrighted Archeus of man, because the terrour in the Toad is natural, and therefore radically, and throughout his whole body incorporated in him, even when dead: but the Idea of terrour in the Pest is only accidental and flowing. The Toad therefore, being in his own nature, afraid of man, increaseth the image of hatred, and heightens his powers, that at leastwise he may privily hurt, and that like the Pest: But this sealed property of hatred, and also of terrour, he carries in his head, eyes, and in the place of the power of concupiscence: therefore his head, and eyes, while he is as yet a living creature, are transchanged into live and true wormes (such as are bred in cheese) but that the extreame part of their head looks somewhat black: For at length, together with his life, so great a multitude of worms falls out, because while he was as yet a living creature, the whole sheath of his brain seems to have been wormy: Surely a terrible, and sealy signate, dedicated to the most terrible and of deaths; *Health or safety from our enemies, and from the hand of those that hated us* (to wit) a remedy.

For truly, the hatred and terrour of the Toad towards us, prepares a medicine of health for us: For therefore an hatred of us is proper to, and naturally incorporated in the Toad, that he carries an Idea of hatred wholly throughout his whole; even so as the spirit of a mad dog, doth by accident the fear of an *Hydrophobia*. But besides, whereby the terrour of us, and inbred hatred towards us, in the Toad, may the higher ascend, and the more strongly imprint their images, the Toad is hung up aloof, nigh the chymney, in our sight; and therefore even his hatred and terrour increaseth unto death. But that the Toad doth by his own conceptions, generate Idea's, I will by and by shew; by the sudden death of the Toad himself: Now at least, I will say that I have cast a Toad into a Lake encompassed with a wall, which on the morning following had dyed, swimming swollen, upon the water: But he had his back besprinkled with a frequent black mark: From which signal spots I conjectured, that he bears a remedy against the Plague even the most cruel one; to wit, the which after a speedy death, utters its own signs: And it addeth an hope, if he promise a remedy for the most fierce and speedy death, that he shall afford a much more excellent one for any the more slow death. But that young

Beginners may acknowledg with me, how much the image of hatred can work in this creature;

cret: It is before all things to be noted, that the Pest of man reacheth not bruits, as neither that of them, him; Because no poyson operates without a ferment of the mummy of man, or the agreement of a co-resemblance: For whether that ferment shall flow out of an infested body, garment, paper, and pestilent air, or in the next place, ariseth out of us, and is shut up under the Tartar of the blood; at least-wise, however it be taken, the plague cannot infect any one without the communion of a ferment.

This poysonous image therefore, and operating image of hatred, in the next place, this seminal image of terrour in the Toad, kills the mumial ferment, without which indeed the pestilent poyson cannot consist, enter, as neither be appropriated by us: This I say, is the manner of operating in a Zenexton; to wit, whereby the communion of the pestilential air is hindered, as it deprives the excrementitious and evapourating Tartar of the blood of a mumial ferment: And it brings in the room thereof, a ferment, the taker away of the pestilent poyson, or an image which kills the pestilent ferment: Because if as it were in a moment, slayeth the mumial ferment, the fountain of contagion, or at least, the fewel thereof, to wit, if it be already present, and hinders it for the future, whereby it waxeth not strong, and it so kills the immediate subject of inherency, that it be not co-suited with our mummy. The ferment therefore, easily dies, if the Seat of the Pest be dis-enabled that it grow not; when as otherwise, every ferment is the meer tincture of a certain odour: For neither is the poyson of the Pest, wasted by the poyson of the Toad, by an action primarily destructive and subduing; but by a secondary action, as the pestilent Idea of hatred, or terrour, extinguishteth the ferment, by whose mediation the poyson of the Pest subsisteth, and proceedeth to infect: For seeing the poyson of the plague is the product of the image of the terrour of the *Archeus*, stablished in a fermental putrified odour, and mumial air, this coupling ferment, the appropriative mean, and immediate subject of the poyson, is also taken away, and there afterwards remains onely a fermental putrified subject, as before, which is to be put to flight by way of sweat: whence it is manifest, that a Zenexton doth at least prevent the appropriation in the first place, and also takes away the seat or essential thingliness of the poysonous Idea of terrour.

And indeed the Lady of *Rommerswal* Toparchesse in *Ecchove*, a noble, affined, and honest Matron, related to me in candour of spirit, that she once beheld a duel between a Spider, and a Toad, for a whole afternoon: For this, when he felt himself to be stricken by the Spider descending from above, and that he was presently swollen in his head, he runs to an herb which he licked, and being most speedily cured, his swelling asswaged; from whence he setting upon a repeated fight, was again also smitten in his head, and hastened unto the same herb; And when as the thing had now the third time happened, the Spectatresse being tired, cut off the Plant with her knife (but it was the Plantain with a narrow leaf) and when as the Toad returned thither the fourth time, and found not the herb, he most speedily swelled all over, and being sore smitten with terrour, presently died: But he betook not himself unto the neighbouring plants of the same Plantain, and those frequently growing (for the image of the conception of fear, and sorrow, produceth a speedy death, the hope of a most speedy remedy perisheth in a most furious disease) for when he found not his own Plantain, he who before encountered from a hope of presently recovering, forthwith despairing through fear and an idea of terrour, died.

For from hence the great fear of this little beast is manifest, the greatnesse and violence of the Idea of dread is conjectured from the speedinesse of his death: For to be straightway healed, swell up, and presently die, do manifest that in this Insect there would be a momentary and present remedy in the plague; as also, that in the poyson, there would be every one his own conception of terrour, formed into an idea: Because such an idea keeps a duality or distinction with the life, and therefore also that supplants this. Neither also hath a live Toad according to my experience, afforded a Zenexton of any great moment: For the grain ought to die if we expect the fruit thereof: and it is convenient that the terrour of us be increased in the Toad: for as our Pest is not morral, or contagious to the Toad, so the terrour of the Toad doth not any thing increase the terrour of the Pest of our *Archeus*: And unless the terrour ceaseth to be a certain conception, and be reduced into an active Idea; as it produceth not the poyson of the Pest in the *Archeus*, so neither doth it cause a remedy in the Toad: For to this purpose it is required, not onely that the Toad do die by reason of the fear of poyson, or of Plantain failing him, and that he be slain by the terrifying Idea of his own conceit; but it is of necessity, that the Toad perisheth by languishing, by reason of the ter-

four of us, he being hung up nigh the chimney, &c. For then that deadly terror being inferior unto, and co-fermentable with our *Archeus*, brings forth an Idea mortal to the Toad, but profitable unto us: For it bears a co-resemblance with the terror of our *Archeus*, forasmuch as terrors do participate in a terrifying image.

But because the terror of the Toad is not belonging to us, therefore it frameth a poyson against the poyson of a pestilent terror formed by the *Archeus* into the poysonous Idea of the Pest: For there is a most excellent preservative amulet in the Toad, ordained for man by the Father of the poor. Consider I pray thee of the Toad with me, in what manner he ariseth out of muck or filth putrified through continuance, between the chinks of stones, and there liveth without food, and grows to maturity for very many years: for a Toad is not seldom times drawn out of the broken stones of *Paris*, which was detained there perhaps for the space of an age: For neither doth he eat before he breaths: And the air being once drunk in, he at length undergoes the laws of death and diminishment: For before he breathed, he lived onely, and that by his own *Archeus*. Almost all other created things do putrifie in a rock: But the Toad is nourished and grows to maturity in a fermental putrified liquour, within a rock or great stone.

From hence also it is conjectured, that he is an Animal ordained of God, that the Idea of his terror being poysonous indeed to himself, should be unto us and to our Pest, a poyson in terror: For as it is sufficiently manifest from the aforesaid particulars, that the Toad is most disagreeable unto our co-tempering and suiting; so the Idea of terror in the Toad is exceeding pestilential to the pestiferous terror it self in us. Since therefore the Toad is an Insect, most fearful at the beholding of man, which in himself notwithstanding, forms the terror conceived from man, and also the hatred against man, into an image, or active real Being, and not subsisting in an only, and confused apprehension (even as hath already before been nakedly demonstrated concerning the Idea's of a woman great with child, and likewise of a mad dog, &c.) Hence it happens, that a poyson ariseth from a Toad, which kills the pestilent poyson of terror in man; to wit, from whence the *Archeus* waxeth strong, he not onely perceiving the pestilent Idea to be extinguished in himself; but moreover, because he knoweth that something inferiour to himself, is terrified, is fore afraid, and doth flie: For so, in every war and duel, from an evident dread of the enemy, a hostile courage is strengthened. But so great is the fear of the Toad, that if he being placed with a direct beholding before thee, thou dost behold him with intent eyes or an earnest look, for some time, for the space of a quarter of an hour, that he cannot avoid it, he dies through terror. The Toad therefore, being slain after the manner of *Paracelsus*, he dying without terror, is an unworthy Zenexton. The *Archeus* therefore, his courage being re-assumed, casts away dread, most especially when as he well perceives the bred poyson of his own terror to be killed: For a Zenexton acts not after the manner of other agents, no otherwise then as the poyson of the plague is altogether an unwonted poyson: Neither doth a Zenexton act materially; but the action of the same is spiritual and altogether sympathetical: For truly, the co-resemblance of activity, wherein the reason of founding a Sympathy consisteth, is in the poyson of terror conceived as well in the Pest, as in the Toad.

But even as the poyson of the Plague is irregular, having nothing common with other poysons; so also a Zenexton being exorbitant or rising high in the activity of a strange and foreign terror, is a manifest poyson to the pestilent image of our terror, together with a refreshment, confirmation, strength, and resurrection of the *Archeus*: which activity of a preservative amulet, surely the Schools could not contemplate of, because they have not been able to contemplate, that that of *Aristotle*, not onely in the plague, but also in other poysons, is false. Indeed the action of a Zenexton is from the victory of the Patient over the agent: for thou shalt remember that the terror and hatred in the Toad, from man the agent, overcoming indeed, but in no wise operating, are made, imprinted, actuated agents, and those brought into a degree, by the proper conception of the Toad; which in the aforesaid Idea are as it were fugitive living creatures; and therefore they restore the terrified *Archeus* of man, and kill the image of the poysonous terror.

Truly in single combats that are spiritual, there is altogether a far different contention, from that which is wont to be by appropriated corporal agents: The which I have elsewhere demonstrated, in removing the activities of contraries from the properties of nature. A Zenexton therefore, is of a magnetick or attractive nature, to wit, acting onely on a proper object, while it meets with it within the sphere of its own activity. It might seem a doubt to some why the image of hatred in the Toad is a remedy;

dy; but why the image of hatred in a mad dog is a poyson: the reason is in the adjoyned Idea of terrour in the Toad, which brings forth an inferiority of poyson: For the one exceeds the other in the sturdiness of conceptions, and therefore also of images: For a mad dog is bold, rash, and his sealed image enforceth its obedience: For neither is he mad, forasmuch as he feareth; but he feareth water, as he hates living creatures: But the Toad is an Animal that is most afraid of us, and as from his inbred hatred towards us, he is badly conscious to himself (divine clemency so disposing it); So the images of those conceptions mutually piercing each other, and accompanying each other, do confer a mark of the greatest pusillanimity or cowardise dipt in the venome of hatred: Hence indeed the image of the pestilent terrour is killed by the image of the deadly hatred, and our Archeus is beheld by the image of the cowardly terrour, through the application of the preservative Pomander, as it were in a glasse, and doth well nigh re-assume the superiority which before he had lost: And therefore the Idea of terrour in the Toad, hates, and also the image of hatred terrifies the Toad, from whence he puts on a poyson for our terror; To wit, by both means, he kills the image of pestilent terrour in the Archeus. There is indeed in spiritual things a primitive self-love, seeing that every original single duel of sensitive creatures, issueth not but from premeditated conceptions; but the Idea of every ones concept, is formed in the imagination, and puts on an Entity or Beingness for to do somewhat for the future: For as the images of motions to be made, do end into motions; so also the images of the Senses are carried, first inwards, for further deliberations of counsels, and they soon there degenerate into the images or likenesses of apprehensions, passions, or disturbances, and from thence they are carried to do something in the body, or out of it, and they slide and grow according to the directions and inclinations of passions: In this respect indeed, such images do limit the vital spirits, or the very operative part of the bowels; according to an impression proper to themselves: which thing most clearly manifests it self in the poyson of a mad dog, who if he were afraid of us, as he is afraid of water, would not do us violence, neither would his biting be venomous unto us. For the Spider, Scorpion, &c. are wrathful little Animals, and the which, if they strike us, they lay up they anger of their own poyson in us, or rather the poyson of their anger.

A certain hand-maid now and then ate spiders, not only the patty-coloured ones of the Vine, but also those black ones out of Caves and moist places, and lived in health thereupon: Wherefore I have considered that the Spider is a fearful Animal, while he is laid hold of with our hand, and therefore that he doth not bring forth a poyson, even as otherwise he doth, while he stings us in anger. From hence indeed, a Scorpion being laid blood of and afraid, heals a wound that was inflicted by himself. Two things therefore in the Toad, do offer themselves in the highest degree; To wit, the image of hatred, by its poysonous quality, extinguisheth and blunteth the appropriative ferment, that the Archeus doth not put on, and drink in the Idea of terrour that is bred: but the image of terrour in the Toad recalls our Archeus, being sore afrighted, and adds courage unto him, that of a fleeing Archeus, he may be made a putter to flight. There are besides a Zenexton, some attractive remedies, such as is the Water-cresse, with the juice of the leaves of the greater raddish, and likewise of red winter cherries, and figs, of each a like quantity; The which being bruised, are applyed, and the skin is opened in manner of a circle: Also the herb *Napellus*, a kind of Wolfs-bane so called, the Grape turned inside out or stript of his skin, Monks-hood or Woolfs-bane, being first boyled in Vinegar, and then with a bruised fig, applyed to the place, do draw powerfully, and open the skin, of which kind of attractives, there are many sorts.

CHAP.

CHAP. XVII.

Hippocrates Revived.

A Certain man being familiar with a happy Angel his keeper, intreated him, that he would beg of God, the remedy whereby *Hippocrates* cured the popular plague of the *Grecians*; hoping that it would not be denied unto the miserable Christians, the which the Almighty in times past granted to the Heathens: The good Angel said, *Hippocrates*, used Sulphur, Salt, and Pitch: which answer left behind it the former obscurities: Hence it came to passe, that that man afterwards said, there was enough spoken for these times. Wherefore after a careful diligent search, at length I resolved with my self that Sulphur in the age of *Hippocrates* was called *Phlogiston*, that is, inflameable: By which Etymology, *Diascorides* soon after said, the best Sulphur was denoted, from its own property, to wit, because it was wholly consumed by the fire. But because *Hippocrates* named the hidden poyson of any diseases whatsoever, a divine thing, in diseases, and because he cured the poyson of the pestilence (which is the chief and standard-defender of poysons, and of contagious diseases) therefore he began to call Sulphur [*τὸ θεῖον*] that is, a divine thing; so that from hence even unto this day, Sulphur is no otherwise written or named, than with the name of Divine; because it heals the Pest: The which, as it was antiently believed to be sent onely from the Gods, so also it was antiently supposed to contain a divine succour in it.

For all bodies universally, even of remedies against poyson, and the air it self, are subject to a fermental putrefaction, and to the poyson of the plague; and therefore they are a fit occasional matter for the Plague. Truly Authors do batter themselves with a tedious disputation, whether Salt be capable of a pestilent poyson? whether a Letter that is closed with a linnen thred, be a partaker of contagion, but not that which is tyed with a metallick thred? I have bewailed the ridiculous Fable of the *Italians*, and their Study of brawling: For truly, paper is no lesse capable of contagion, than flax, from whence it is made. Silver also, Gold, and the most cleansed glasse, and an Antidote it self, may drink in the forreign poyson of the plague: But Sulphur alone, among created bodies, resisteth a fermental putrefaction, and the contagion of the plague; Because Sulphur alone being like unto fire, drives away all putrefaction through continuance, as well in Hogsheads, as in places themselves, and blots out the foot-steps of any touch and odour: For so Sulphur also takes away well nigh every scabbednesse of the skin, because it is an enemy to contagion: Wherefore neither is it a wonder, if the Pest being derived into the skin from an internal Beginning, be also drawn out by Sulphur. For since that in the whole Universe, nothing doth more readily conceive fire than Sulphur, because it is as it were a meer fire; no wonder that Sulphur demonstrates the properties of fire, which are to burn up all things, nor it self to be infected with contagion.

Truly I have seen in the watery tract of *Gaunt*, a whole legion of *Neapolitans* to have died of the plague, but there was in the same place a Company of *Germans* which ringed their shirts with Gun-powder, that they might excuse their Landresses; and also the lice: If any of these perished, it was by reason of the bloody Flux, but not of the plague: Therefore *Hippocrates* separated *τὸ θεῖον ἄπυρον* (that soundeth Sulphur, or a divine unexpert or crude fire) which is named in the Shops *Sulphur Vive*, from the superfluous earth, onely by fusion. But it is yellow, which being once enflamed, burns moreover even unto the end, neither doth it contract a skin in its superficies, as neither doth it leave a dreg behind it worthy of note; but being once enflamed, it wholly flies away; and therefore was it named *φλογιστὸν* or inflameable. For in the age of *Hippocrates*, the manner of extracting Sulphur out of the Fire-stone and Marcasites, was not yet made known: Wherefore the Sulphur of *Italy* is better than our Country Sulphur bred at *Leydon*. For the Fire-stone expires forth some Arsenical matter in the boyling; for why, thetefore Arsenick is commonly called the fume of metals. *Hippocrates* therefore, at first commanded the houses that were infected with the plague, to be perfumed with Sulphur: For indeed Sulphur while it is burned, and its heterogeneal parts are sepa-

separated, it affords a black smoak, and belcheth forth a watery and acide or sharp Salt, which is constrained into a liquor, and is called the distillation or oyl of Sulphur.

In the next place, out of enflamed Sulphur, the homogeneous part of the Sulphur doth exhale, it arising indeed, by reason of heat, but being not yet enflamed; and therefore it flies away with the fume or smoak, before it can be snatched hold of by the flame; For so, out of woods, oyls being not yet enflamed, do ascend together with the smoak, and affix a smoakiness or soot as yet combustible, unto the sides of the Chimney: But Sulphur thus flying away, together with its smoak, as it is in its former disposition, so neither in this place, is it of any valour.

But since every seed of burnt Sulphur is destroyed by the flame, for that very cause it is transchanged into a Gas or wild spirit, which by reason of the properties of its own concrete or composed body, is an Antidote against the Pest: For seeing that a medicine ought suitably to answer to the disease, the water, salt, smoakiness, or volatile floure of Sulphur, cannot be the true remedy of the plague; but only that subtil and almost incorporeal Gas, which is therefore straightway comixable with our Archeus: Therefore that Gas refresheth those that are affected in their womb, with its smell, but not the oyl, not the tincture, milk, or floure of Sulphur.

But after what sort thou mayest know that Gas of Sulphur to be distinct from the watery vapour thereof; kindle a sulphurated torch or candle in a glass bottle, thou shalt forthwith see the whole bottle to be filled with a white fume, and at length the flame to be stifled by the fume: Afterwards, keep thou the bottle most exactly stoppt with a cork, and thou shalt see a sulphur to be affixed unto the sides of the vessel, and in the superficies of the water, if there were any in the bottom: But if indeed, after some daies, thou shalt put the same enflamed torch or bottle into the neck of the candle, the flame is forthwith extinguished by reason of the condensable Gas of the Sulphur; no otherwise than as the odour of an Hoghead putrified through continuance, stifles the flame of a sulphurated candle.

But *Hippocrates* perfumed all the wine which he gave in the plague, after this manner: He perfumed the pot or cup of a narrow neck, with a candle of burning sulphur, he powred in wine, to the filling of the pot a third part full, and stirred the pot being exactly shut, by shaking it a good while together, upwards, and downwards, until the wine had drunk up all the Gas of the sulphur into it self: For medicines to be hung on the body, and Amulets or preservative Pomanders had not yet been made known: But he supplied external medicines that take away weariness or faintness, in the room thereof, by anointing the body with Greek Wine wherein he had boiled the most fine powder of Sulphur: But he besprinkled the same fine powder being dried in the Sun, on those that were in a sweat, and commanded it to be applyed with rubbings: But the Pest, since it never wants a Fever, and that the *Grecians* saw the remedies of *Hippocrates*, they began first, to call the Pest, and then every Fever, πυρ, or a fire: Not indeed, by reason of a remarkable, and necessary burning heat of Fevers (although it so pleased *Galen*): For truly, they called the beginning, cold, rigours and horrors, Πύρ or a fire, as well as a burning Causton.

For *Hippocrates* lightly ground Sulphur with water, on a Grind-stone, and being again dried, he kept it for his uses: But he gave twenty four grains of Sulphur with salted, and hot wine, that he might provoke sweats: But he first made the salt to crack in a glassen pot, and presently afterwards, he melted it, by increasing the fire; for else, salt containeth in it excrementitious filths, which at the first cracking, fly away, the salt cleaving asunder and leaping a little: These Spirits do easily putrifie through continuance, and subject the salt to a fear of contagion; for they are very forraign to the salt; the which although they fled away a good while before the fusion of the salt, yet he made a melting of the salt, that whatsoever foreign thing was contained in the salt, might be consumed by the fire: For indeed, he saw that presently after the invasion of the Pest, the appetite was prostrated, and then also, that fermentally putrified and burntish impurities grew in the stomach, from whence arose the headach, vomitings, loathings, doatage, the drowsie evil, &c. which would hinder the cure of the plague: Therefore he took the common balsam of the salt of fleshes, which might overthrow the fermental putrified poyson, and putrefactions, by cleansing them away, together with a conserving of the strength; and he gave the wine being salted, hot, but not luke-warm, that he might restrain the loathings of the stomach, and mightily provoke sweats; and he added Sulphur, that it might kill the plague as it were with its odour; because salt cleanseth, preserveth

serveth from corruption, and Sulphur restrains poyson: But he prescribed this sweat for three daies space at least, yet oft-times he extended it unto a weeks space: but they did sweat twice every day, and at every turn, for the sixth part of a day, if they were able; on the first daies more, and on the after succeeding daies, less: For in time of sweating, he took away all drink; but the term of sweating being finished, he fed them with Barley-Cream, and for drink, they had Greek Wine pitcht, wherein were a few grains of the aforesaid salt, and Sulphur: But he laid the leaves of *Assara Bacca*, being steeped in vinegar, upon the Bubo, unto the soles of the feet, and palms of the hands, which after every twelve hours, he commanded to be buried, because they stink greatly. It came to pass afterwards, that *Greece* be sprinkled their grapes, divers times, with the Brine of the Sea, before they were carried to the Press: For *Hippocrates* perswaded that thing, that so, together with it, Insects might be driven from the grapes: Hence it is, that the Wines of *Greece* are salted even unto this day, the reason of this use being unknown. Unto great Buboes in the groyn, and marks, he applyed hot Towels tinged in rich wine, wherein, as I have said, he had boiled Sulphur. Furthermore, he reserved a secret to himself, through the sight whereof, he attained to himself, divine honours: But it was the flesh of a Viper, or or Snake, which he cleansed: for the utmost part of the tail, and the head, being cut off, he stript off their skin, casting away the bowels, together with the gawl, he reserved only the Heart, and Liver; but he drew out all their blood, with the vein running down the back-bone: But he boiled not their flesh after the manner wherein it is put into Triacle; but he exactly bruised the same, together with the bones, and aforesaid bowels, and dried them in a warm Oven, until they could be powdered; which powder he sprinkled on hony being sufficiently clarified and boiled, until he knew that fleshes in boiling, had laid aside their virtue as well in the broath, as in the vapours: But he added unto this Electuary, the Spice of his Country for to cloak the secret; and therefore, neither was it made manifest by the Angel. But the cure contains a mystery; that as Death crept in by the Serpent, it self also, ought to be vindicated by the death of the Serpent: For *Adam* being skilful in the properties of all Beasts, was not ignorant also, that the Serpent was more crafty than the other living Creatures; and that the aforesaid balsam, the remedy of death, lay hid in the Serpent: Wherefore the Spirit of Darkness could not more safely deceive our first parents, than under the Serpents skin: For perhaps they hoped that they should escape the death sorely threatned by God, by the aid of the Serpent.

Hippocrates used also wine that was pitcht: Wherefore it is worthy our consideration, that *Spain* is seldom afflicted with the plague; not because sins, or filths are wanting, where there are almost no Jakes's: Its a Country, I say, raging with heats, imitating of, and co-bordering on *Africa*: Nor also, because their great men do cool their drink with snow: because, at least the Rusticks and Citizens should pay the punishment of their own sins, with the plague: But *Egypt* useth waters and fruits, from whence there is a fermental putrefaction in their flesh: but *Spain* useth wine, and indeed that which is pitcht, because, seeing for the most part, they want Hogheads, they keep their wines in pitchd Hides or Leathern Jacks: *Italy* hath wooden vessels; therefore it doth not, as constrained, make use of pitch, and it is more frequently, violently taken with the Pest: For pitch being applyed to Carbuncles, is for an ease or comfort, and they are quickly opened; for pitch imitates the blackness of an Eschar. Among known trees, the pitch-tree alone is made a torch, and by reason of its fatness, it presently dies, if but a little earth be added to its Trunk: for God is liberal in his remedies, and that is proper to his goodness: For death happening by a tree, it hath seemed to be ordained for a remedy against death, unto man that was made mortal by a tree. The smell of pitch is familiar for a suffumigation unto very many Provinces infested with the Plague: For so *Petrus* affirmeth, that *Hippocrates* had not one only remedy against the Pest; and that he was sacrificed unto by the *Athenians*, as it were unto a protecting starry God. When as therefore, the *Greeks* saw *Hippocrates* to use a remedy known only to himself, unto whom therefore they attributed their life, health, and whole preservation; they by degrees despairing, the use of salt, and sulphur went more and more into oblivion, especially if some years that were free from the plague, interposed: And afterwards, every Physitian began to select divers medicines, hoping that his own was the Antidote of *Hippocrates*: From whence there was afterwards a standing crop of remedies collected, without number, for the most part, with empty ears. At length, from a slender senting of the praise of the Viper, the composition of Triacle arose, it being partly loaded with a confounding of simples, and their odours being partly dispersed in time of preparation, and they cast away the better properties of the Viper in the broaths. At this day, the Antidote of *Orvietanus* is made

of great account for the plague; because he first dared to swallow any poyson unknown unto him, in the open market place; which thing, the *Germans* at this day perform only by the use of the Snake: For they little distinguish the Pest from other poysons, and have taken little notice, that against the will of the Electuary of *Orvictanus*, the plague notwithstanding, hath lately raged throughout all *Lumbardy*: For I omit, that the Pest doth radically differ from other poysons.

Quercetanus, and the Writers of this sort, in their *Caco-Alexiteries* or bad medicines against poyson, and in their young beginnings, do dictate very many remedies (whether boldly, or sottishly, let others judge from the roots of the Pest supposed) every one whereof is framed, not indeed from knowledge, but from thinking alone, and the Author of them is worthy of pity, if not of punishment: For *Ranzovius* concerning defending health, describes a *Saxonian Antidote* for his Son, it being tryed divers times by me, but always in vain; because the poyson consisting in a spiritual image of terrour, hath nothing in the aforesaid Antidote, which can radically overcome the same image: and therefore by reason of the ignorance of the causes of the Pest, any one hath devised many remedies; and also, hath connexed many things unharmoniously together, against the poyson forreignly entring: Indeed, all of them confused, without a method, experience, reason, and knowledge of the causes: And nothing having been at all devised against the Pest arisen from the foolish image of terrour, and the persuasion of fearfulness; afterwards, from the age of *Hippocrates*, every Physitian began at pleasure to select divers remedies, and to connex many things together, and much more than many, hoping that his own invention was that of *Hippocrates*.

In the mean time, the number of compositions increased, and by degrees, uncertainty supplanted the antient truth: And although an Antidote which operateth about the effects of the poyson produced in the body, be to be greatly esteemed; yet while it operateth not on the terrours of the Archeus, and the image produced from thence, truly, neither can it bring help to the pestilent contagion; or if any one do revive from the plague with those Antidotes, that is not done but with an unfaithful succour: For in the plague, the Archeus himself is well nigh bewitched with terrour and grief, and stamps a pernicious image on himself, which is the true Pest; from which, neither doth he voluntarily re-arise, unless by a singular power of nature, and divine grace. Moreover, as I have elsewhere demonstrated in a particular Treatise, that the first assaults of conceptions, do not stand in a free disposition of the will, but that they are framed in the midriffs; So by arguments drawn from thence, I have fitly or exactly beheld, that the image of terrour, and indeed the plague it self, is formed about the Jurisdiction of the stomach and spleen: and that thing, I seriously and by long leisure discerned, and have exactly confirmed from observation, by very many histories; one or two whereof, to have repeated, shall not be besides our purpose.

A certain young man, beholding his little Sister to be be-spotted with a black mark, and to be dead, being sore smitten with terrour, presently felt a load about the mouth of his stomach, the admonitions of continual sighing: He daily used Triacle, Myrrhe, and the root of Butterbur being adjoynd thereunto: he ate and drank even unto merriment: At length, on the twelfth day after the death of his Sister, a Fever, and deep drowsiness laid hold on him, and on the third day after, he died. A Noble Virgin, having suffered a colic-like burden, and anguish of terrour, at length, passed over restless nights with a dejected appetite, with sighs, and oppressions of her stomach, and a panting heart, a slow and continual Fever took hold on her, with an uncessant struggling of fear, and hope: For as many deliberations of animosity or courage, and of free resignation, as she could make with her self, were in vain: Meats also being despised, there at length, remained place for strong wine; and that also she soon disdained; neither also was she so greatly afraid of death, as of future doating delusions:

In the mean time, she laughed at her foolish perplexities, or mournful vanities, and it grieved her self of her own folly: But the Physitians had sent their own Antidotes unto her, under which, the Duel of her mind increased, no otherwise than as in those that are bitten by a mad dog, with their disease of the fear of water; and at length, through the mortal sorrow of the pestiferous terrour, she now plainly despaired in mind; because she was she, who for three weeks space, had admitted of no sleep, with a perpetual Agony, and despairing of life, and yet was vexed with her self, through a full remembrance or knowledge of her own foolish struggling; and Opiates being administred, she found her self worse. At length, between the fear, and desiring of death, she plainly recovered by the remedy of *Hippocrates*, in six hours space. In the mean time, I confess, and admonish

H h h h h h

nish

nish by way of protestation, that I have plainly enough manifested the bosom of the remedy of *Hippocrates*, that it may be sufficiently plain only unto the Sons of Art, and true Physicians, and covered for the future, only to sloathful Physicians, that are enslaved to gain, and to the envious haters of the truth.

But I have declared, 1. The aforesaid histories, that plagues beginning, may be manifested not to be as yet seasoned with the pestilent poyson, and not yet to be accompanied with a sufficient image of terrour,

2. And that the virtue of the remedy of *Hippocrates* may from thence be made manifest.

3. That the first violent motions of confusion, terrour, and imagination, do happen in the midriff, about the mouth of the stomach; To wit, in the Spleen, whose emunctory is nigh the mouth of the stomach, and so that it is the mark of that Archer: For in a healthy young man, whom the plague had snatched away in seven hours time, a dissection of his body being begun, I found a long eschar now made, to be, as at first the mover of vomit, and afterwards the Authour of continual swoonings; so also, to have given an occasion of sudden death; even as in others, I have noted a threefold eschar to have been made in the stomach, in sixteen hours space.

4. That the master of Animal subtilty, hath with his white wand of sleep, chosen the Inn of drowsie sleep, and watchings in the same place.

5. And that the seat of all madnesse and doatage, is in the same place: And that thing I have elsewhere professedly founded by a long demonstration.

6. That purging likewise, as also myrried Antidotes for the Pest, are not safe enough, or worthy of confidence.

7. And that all reason, deliberation, animosity, resignation, consolation, argumentation, and all the subtilty of man on the contrary, do but wash the *Ethiopian*, in the Pest, even as also in the disease *Hydrophobia*.

8. That the endeavour of preservatives is sluggish, as oft, and as long as the seal of the image framed by terrour, remaineth.

9. That such an image stirs up from it self, continual sorrows, and spurns at the phantasie it self, and drawes it captive to it self, no lesse than the biting of a mad dog, brings forth an unwilling fear of water, or the Ring of a *Tarantula*, the doatage of a tripping dance.

10. That the comfort of sweating alone, is loose in such terrours.

11. That the Idea of fear not being vanquished in the bowels, nor the dreg wherein that image sits, banished, it is in vain, whatsoever the magistrals, or compositions of the shops do attempt: For *Hydrophobical* persons, although now and then between while, they speak discretely, fore-feel, and fore-tel a madnesse coming upon them, yet they cannot but be driven into the madnesse of their own image.

12. That swimming is destructive, and whatsoever restraineth sweat.

13. That Barley broaths, pulses, syrups, and Juleps, are loose and frivolous remedies for so great a malady.

14. That it comes from a bastard plague unto a true or Legitimate one; yet that the sick do often fail under the beginning thereof, before it sends forth its tokens: The which traiterous signes notwithstanding, presently after death issue forth.

15. That grateful odours, the perfumes of spices, feathers, or shooes, do bring no defence or succour for the plague: For by way of example; if thou seasonest an hoghead of wine putrified through continuance, with the odour of spices, or with any other odour, except that of Sulphur, it remaines fermentally putrified, and it soon defiles the new wine which thou shalt pour in, as the former. Wherefore sweet-smelling things do in no wise take away the terrour, and the poysonous Idea of terrour, from the Archeus being once terrified; Because they take not away the matter of the poyson; and much lesse do they kill that poyson, or remove the terrour from the Archeus, as neither do they refresh the fear thereof, or comfort the part affected.

For *Paracelsus* commends unto the City of *Sterzing* that was bountiful unto him, myrrhe being by degrees melted under the tongue, before any other remedies, and boldly promitteth it unto the younger sort, for a preservation for 24. houres space: which doctrine notwithstanding, I have experienced to be false: For I have seen young folks, with the much use of myrrhe, to have been killed by the plague. Myrrhe indeed, although it may preserve dead carcases from putrefaction, instead of a balsam; yet the Pest far differs from putrefaction; No otherwise than as the eschar of a bright burning iron differs from putrified blood: And although corruption succeedeth in a carcass now dead, yet the poysonous image of terrour doth not properly putrify, as it doth most properly slay the vital Archeus, and tranchage him into a poyson, with it self: For he bids that
myrrhe

myrrhe be held in the mouth : As if the plague knew not how to enter but by way of the mouth : Therefore far more advifedly to have shut up the mouth in filence. Truly the Pelt will abhor myrrhe , nor will it dare to enter in through the noſtrils , if myrrhe being detained in the mouth , doth diſſolve : ſhall perhaps, the odour of myrrhe hinder, whereby the poyſonous image is the leſſe poyſonſom , is not poyſonſom ? Is not hurtful ? For ſhall myrrhe in the mouth , repulſe the plague from the Archeus ? The ſame reaſon is alike frivolous and fooliſh for Triacle , vinegar , &c. perfumed with odours.

At length, let mortals know, that in healing, nothing is alike hurtful, as a raſh belief given without a pledge, and truth. Truly, the accusations of the ſick, will at ſometime thunder againſt the negligence, falſhood, dectful juggles, raſhneſſes, and falſe wares of Phyſitians, whereby people have been ſpoyled of their life. But I have diſcerned by the books of *Paracelſus*, that he was a man raſh in promiſing, unexpert in the plague, unconfiant in its remedies, ignorant in its cauſes, as alſo ungrateful toward the bountiful City of *Stertzing*. Let his honourers ſpare me, that I am conſtrained to ſpeak candidly or plainly for the truth, in a matter of ſo great moment, leaſt any one in the plague, ſhould put confidence in his ſuccours.

CHAP. XVIII.

The image of terrour ſifted.

I Have hitherto produced the unheard of poyſon of the Pelt : To wit, that the ſoul, and the vital Archeus thereof, are powerful in an imagination proper to themſelves : But that that power of the aforeſaid imagination, is to form Idea's ; not indeed, thoſe which may be any longer a Being of Reaſon, or a non-being ; but that they have altogether aſtually, the true Entity of a ſubſiſting image : which imagination ſurely, ſeeing it is a work of the fleſh, and alſo common to bruits, as to us ; hence indeed, it is framed in the outward man, from which, nothing but [this ſomething] being far different from a ſpiritual conception, proceedeth : But for the obtainment of which ſubſiſting entity, the Archeus himſelf ſo cloaths his own conception (which as yet, is a meer and abſtracted mental Idea) in his own wrappery, or in a particle of his own air, that what he conceived in himſelf by an abſtracted conception of imagination, that very thing the Archeus preſently arraieth and cloatheth with the vital air ; So as that afterwards, it is a ſubſiſting Being, to wit, an image framed from imagination.

Moreover, as there are diſverſe unlikenesses of conceptions and paſſions, according to the liberty of that *Prothens*, ſo undoubtedly there are alſo, manifold varieties of thoſe ſame images, far ſeperated from each other, and the Idea's of theſe, being cloathed with, engraven in, and having made uſe of the vital ſpirits, do diametrically utter forth unlike operations in us : And therefore the images of terrour are very poyſonſom, and potent to deſile the vital ſpirit bearing a co-reſemblance with them, which inhabites as well in the heart and arteries, as in the very family of the ſolid parts it ſelf ; To wit, the which image, and moſt powerfull efficacy thereof, I have already before, and many times elſewhere demonſtrated as much as I could : I have ſaid alſo, and demonſtrated, that the ſame image is the eſſential, formal, and immediate eſſential thinglineſſe of the Pelt : Becauſe that the plague is not unfrequently framed, from a terrour of the plague only, although there fore-exiſted not a material cauſe from whence it might be drawn. I have afterwards treated by the way, of the preſervation, and curing of the Pelt by a Zenexton, and remedies in times paſt uſed in *Hipocrates* his time ; yet there hath not as yet been enough ſpoken for the preſent age, in order to a cure : For truly, very many difficulties offer themſelves, which have not been ſufficiently cleared up.

Fiſt of all, the image of terrour is only one indeed, in its own kind, and therefore it may be difficulty underſtood, that the Pelt ſhould be able by the one only and uniforme Idea of affrightment, to afflict ſo diſverſe things, and not only in diſtinct emunctories, but equally, ſo diſtinct parts throughout the whole body, at its pleaſure.

Secondly, And then, that the ſame image of terrour ſhould be able only by its beck,

H h h h h h 2

to

to stamp products so different from each other : Such as are Carbuncles, Buboes, Eschars, little bladders, Pustules, Tumours, Tokens, &c.

Thirdly, in that the one only Idea of terrour should invade and besiege, not only the external parts, but also the stomach, and likewise the head, &c.

Fourthly, that a unity of that Idea, should sometimes produce a most sharp disease; at another time, a disease that is slow, and twinkling by degrees; elsewhere, a disease by degrees decaying of its own accord; since such effects may seem to accuse, rather a diversity of the poyson, than an identity or sameliness thereof.

Fifthly, that the *Archeus* of man being sore afraid of the poysonous Idea of terrour, and as it were, a run-away, should have the power and courage of producing an Eschar in the skin, like unto a bright-burning iron.

Sixthly, because doatage, I say, and watching, seem not to bud from the same Beginning, with a deep sleepy drowsiness. But one only answer, easily blots out every such kind of perplexity: For indeed, every first conception, and the first assaults or violent motions of conceptions, do happen beneath the Diaphragma or midriff-partition, which therefore are denied to be subject to reason, or to be in our power: Wherefore that Hypochondriacal passions do grow in the same place, every age hath already granted: and then, that the pest or plague is oftentimes immediately introduced from a pestilent terrour, none doubteth; which terrour, as it is framed by the imagination of that place; So also, the image of terrour is stamped, from whence the imagination hath drawn an Etymology to it self: But such an image is not idle, or without a faculty of operating; seeing none is ignorant, that most diseases have took their beginning from naked perturbations or disturbances.

In the next place, terrour is not only the dread of the Soul of man, and of Reason alone; but also the *Archeus* himself is terrified, and wroth, with a certain natural fervency, and the illurements of passions. Furthermore, terrour stamps indeed an image, the Effectress of the plague, the Mother of confusion and terrour; but that image assumes not a poyson from an undistinct confusion of terrour, from a confused terrour, and from the fear or flight of the forsaking *Archeus*: But as every Serpent, and mad dog, produceth a poyson, by the conception of a furious anger; So also, the terrour of the *Archeus* is not sufficient for the producement of a pestilent image, unless the fury of the *Archeus* shall bring forth a poysonous image, which also pierceth and is married to the image of terrour.

Hence indeed it comes to pass, that the Pest is for the most part bred about the stomach, and doth there manifest it self by loathings, vomiting, lack of appetite, pain of the head, a Fever, drowsie evils, and at length *Delirium* or doating delusions: For truly, I have amply enough demonstrated elsewhere, concerning Fevers, and in the Treatise of the *Duumvirate*, that this household-stuff is conversant about the stomach: For an Eschar is not made in a dead body, but only in live ones; and so, from the life, and *Archeus* himself (even as concerning sensations elsewhere) who being wroth, brings forth the image of fury, which was bred to change its self, and the whole spirit of the *Archeus*, and the inflowing spirit of the Arterial blood it self, into a corroding *Alkali*: For the vital spirit, which in its first rise, was in the digestion of the stomach, materially sharp, and which in the succeeding digestions, is made salt, and volatile, doth formally degenerate, and is made a corrosive salt, and a volatile *Alkali*, the efficient of the Corrosion and Eschar: For, for the madness of so strange and forreign a transmutation (to wit, produced from a strange and forreign image) whatsoever is vital in the very solid substance of the parts it self, all that, through the wrothful vital principle being angry and enraged, is enflamed, and brings forth divers diseases (which are plain to be seen in the burning coal, in the Persick fire, in a Gangren, in an Erisipelas, &c.) It is manifest therefore, that from the same Beginning of the *Archeus* being sore affrighted, and enraged into a dog-like madness, it happens, that the plague is diversly stirred up, sometimes in the stomach, sometimes in the skin, Glandules, Emunctory places, and also, now and then, in the very solid family it self, of the similar parts, or bowels; from whence mortal spots, Eschars, and combustions do happen, according to the diversity of the parts, whereunto the *Archeus* being full of fury, and full of terrour, shall divert himself: But that the *Archeus* being terrified, and a run-away, and returning as half in a rage, is made so hostile unto the parts his Clients, over which he alone is president, the confirmation thereof is not elsewhere to be fetched, than that a thorn is thrust into the finger, which by the fat or grease of an Hare, is safely expelled without discommodities, as that remedy asswageth the fury of the *Archeus*: which thorn doth otherwise, stir up a great Tragedy of fury

fury : For the *Archeus* brings forth a poyson in his Clients , by his own fury , the which otherwise, a simple small wound, would willingly be ignorant of. Conceive thou, how unlike is the wound of phlebotomy , and the sting of a Bee : And likewise the stroak of phlebotomy that is clean, how far doth it differ from the prick of unclean phlebotomy. Its no wonder therefore that the fear where the image of the conceived terrour , and piercing of the combined image of fury shall first happen, is hottilely disturbed, is furiously scorched ; yet oftentimes poysonous, tempests, are transmitted and chased unto the more outward habit of the body , by the implanted spirit of life , unto places I say, whether the Latex or liquor of the veins tendeth of its own free accord, in time of health, or they are dismissed unto the external habit of the body : And therefore, whatsoever is to be done in the Pest, that is to be cured with speed : For sometimes the image of the Pest, is cloathed only with the inflowing spirit , and then medicines that provoke sweat do readily succour : But where the inhering and in-bred *Archeus* conceiveth the image of his terrour, and fury in the solid parts, unless he presently resign up and lay aside the conceived image, unto and in the spermatick nourishment (I have called that corrupt nourishment the Tattar of the blood) and produce a tumour , there is danger least it presently pass over into the very substance of the solid parts, which contains an unexcusable detriment of death : And therefore, that the plague may not take up for it self a tough Inn within the body, we must procure, that the pestilent image do not long float within ; but that the whole household-Ruff be allured forth, and fall out by sweat : For the Carline Thistle, is said to have been in times past , shewn unto an Emperour, by an Angel, for the plague of his Army (perhaps therefore called Angel-Thistle) because the first rise of the image of the Pest, stirs up drowfie evils, loathings, a Fever, vomiting, and head-aches about the stomach ; but the herb *Ixia* or Chamilion, drives away sleep , and much more deep drowfinesses against Nature ; and therefore they hope, that the extraction of fresh Carline Thistle, should not be unfruitful for the plague that is newly begun.

The End.

Gospel. This, should not be dangerous for the plague that is newly begun.
 deep down beneath the Nature; and therefore they hope, that the extinction of flesh
 hews the flesh out; but the heathen or Christian, drives away sleep, and much more
 image of the Pest, this up grows the evil, for a Fever, vomiting, and head-aches a-
 plague of this Army (perhaps therefore called Angel-Tribble) begets the last time of the
 Tenth Plague to be sent in this Pest, the vastness of the Plague, by an Angel, for this
 but that the whole household will be allured forth, and fall on by sweat; for the 6. animal
 I am within the body, we must procure that the heathen image do not long their within;
 descent of death. And therefore, that the plague may not rise up to the 11. soul;
 tenly pass over into the very substance of the solid parts, which contain an inseparable
 influence the Taint of the blood, and produce a remour, there is danger that it pro-
 ceived images, and in the 10. stomach nourishment (I have called this corrupt remour
 his remour, and stay in the solid parts, which he presently takes up, and lay aside the con-
 doctably fixed; but where the substance is, indeed Athens conceive the image of
 Pest, is fastened only with the new spirit, and then it makes that move faster
 to be done in the Pest, that is, it is not with speed. Therefore the image of the
 bodies are divided into the 10. parts of the body; And therefore, whatever
 after that men or part of the body, instead of its own record, in that of death,
 more outward, both of the body, by the imagined spirit of life, into parts lay, with-
 outly forced; yet the image of the body, are transmitted and chaste into the
 picture of the contained image of any that is happen, is holdly divided, in that
 as no wonder therefore that the last image of the conceived remour, and
 of philosophy that is in, how far is it from the truth of an philosophy,
 how much is the want of philosophy, and the thing of a Pest; And likewise the work
 which others will, and the remour, that is, it is not with speed. Therefore the image of the
 body. For the 10. parts of the body, are not in his Client, by his own way, the

Death

The Table.

D.

E.

Death comes not from a dry habit of the Body.	729
Death is from a decay of vital powers.	730
Several occasions of Death.	752, 753
Drif what it is, and what required thereto.	595
Manner of making it.	596
Dontages observed.	278, 33
What drinks best in sharp sicknesses.	454,
	22, 24
The actions of the phansie from the Duumvirate.	303, 31
The power of desire in the Duumvirate.	304,
	37
The Harmony of life from the Duumvirate.	306, 52
Fatness from the Duumvirate.	308, 59
The Duumvirate.	337
Its Power, Seat, and Works.	340, 341,
	364, 49
Understanding is formed in the Duumvirate.	275
Why the Spleen and Stomach are called the Duumvirate.	287, 26
Authority of the Duumvirate.	296
The Dropsie Anasarcha, whence.	449, 62
Its seat.	515
Dropsie unknown.	507
Not seated in the Liver.	509
How stirred up.	512
What the efficient matter ther eof is.	513
The Cure.	521
A Bastard Dropsie.	ibid
What abstinence from drink may effect in the Dropsie.	519
Of Dungs and Toads in the Dropsie.	519,
	520
Why drowned Bodies swim after a season.	427, 73
Drowsiness as well artificial as natural helped by Lixiviums.	303, 31
The vanity of drying up superfluities.	440,
	42
Of drunkenness.	449, 63
Of being drunk with new Wine.	122, 23
Duelech of Paracellus.	833
Duelech is made of the Urine.	836, 837
Three Spirits concur for the nativity of Duelech.	850
Its manner of making with an observation of the Fountains of the Spaw.	851
What may be found in Duelech.	861
Of the savour of Dungs.	212, 26
Where the Ferment of Dung resideth.	221,
	811

E.

Earth, why not reckoned among the primary Elements.	49, 16, 110, 44
---	-----------------

What the Original Earth is.	50, 3.
'Tis Called the foundation of nature.	4. ibid.
It breaks forth to light in some places.	51, 5
The Earth is a fruit of the water.	66, 23
The various distinct Pavements of the Earth.	94, 5
The diversity of Soils in the Earth.	688, 3
In the last Soil the waters live.	689
Of Earth-quakes.	93, 2, &c.
It is alwayes a threatner of punishments.	102,
	33
Ear-wax good for pricking of the sinews.	247
Eels bred by Honey and Dew, &c.	478, 37,
	1026, 65
Of the virtue of the Liver and Gaul of an Eele.	304, 46
An informative Simile of an Eg.	45, 12,
	113, 10
The prayse of Elecampane.	703, 10
Of the Elements.	48
The two Elements Water and Air untransmutable.	65, 7, 69, 1
Their co-mixture no constitutive principles of bodies.	134, 24
Elements do not fight nor have contrariety.	163
They Cannot destroy each other.	1048, 16
Electrum of Paracellus against Inchantments.	65
Elixir proprietatis and its preparation.	574.
Elixir proprietatis not made without the Li- quor Alkahest.	813
Of the Embrio of a Bull-Calf its use.	883
Of Endemics.	188
Endemical things are drawn in by breathing.	189, 7
The Progress of Endemical things.	191, 13
The Epitaph of an Emperour.	528
Of the Ephialtes or night-Mare from what stirred up.	299, 15
Epilepsie whence stirred up.	114, 17
Erisipelas its Cure.	475, 29, 114, 17
Essence what it is.	414, 76, 81
And in some things not so effectual when separated.	ibid. 78
Eve not cursed.	654, 13
Eve not appointed to bring forth in pain.	654,
	14
Eve deflowred in Paradice.	666, 33
Excrementitiousness whence caused.	430, 4
Extracts their invalidity.	459, 12

F.

Of the infection of a dead Falcon.	1134
Fasting when easily brooked.	24, 51
Fever not cured by Phlebotomy.	953
A Fever hitherto unknown.	935
Thirst in Fevers examined.	936,
	Drink

The Table:

F.			F.
Drink allowed in Fevers.	453, 19, 902	where medicines are wanting.	702
Caution about their food.	454, 24	What a Fog is.	68, 24
Flesh to be skind.	ibid.	What a Form is, and whence.	130, 23, &c.
Whence Cold and then hot.	471, 4, 973	The distinction 'twixt an Essential and substantial form.	130, 7, 133, 22, 143, 67
What the Sunochus Diary and Hectick Fever are.	978	A four-fold form.	143, 67
Seat of a putrid Fever.	978	Fox lungs censured.	260, 38
The occasional cause of Fevers twofold.	979, 980, 986	Of the original of Fountains.	688
The Cure.	987	Fountains dispense the seeds of Minerals and Metals.	690, 19
A Diary and Hectick affect onely the vital Spirit.	973	Fountains not thickned by the air.	691
Essence of Fevers discovered.	1002	From whence the best fountains do arise.	694
Feverish matter swims not in the Blood.	956	Of the Keeper of Fountains.	ibid
The essence of Fevers not from heat.	940	Why they are called sharp.	ibid
The seat of intermitting Fevers.	948	What the sharpness of Fountains proceeds from.	695, 22
The original of Camp-Fevers.	1096	Of the fountains of the Spaw.	696, 1
The poisonous Excrement in Fevers included in the Midriff.	331, 25	What they contain.	697, 5
What a Ferment is.	31, 24, &c.	Why a vein of Iron is invisible in fountains.	698, 8.
By what continued.	1124	Why fountains are different in strength.	698, 14
Ferments being different, do cause different operations.	479, 48, 115, 26	Of the virtues of the hungry salt of the Fountains, and how far they act.	699.
No transmutation without it.	111, 1207, 2	Whom they do not help.	ibid
Why commanded not to be used.	111, 1	How they profit in the stone.	700, 12
Its properties, &c.	112, 3, &c.	The qualities of fountains are Relollems and Cherionial.	701, 19
The Ferment of the Plague.	11, 22	Advice to those that drink of Spaw waters.	702
There are double Ferments in nature.	112, 8	How the waters may pass to the midriff quickly.	ibid
Ferments the causes of transmutation.	207, 8	How much he ought to drink, and what he is to take with it.	703, 10
The Ferment of the Stomach not from it self.	ibid.	A Frog how reducible to its first matter.	141.
Ferment of the Spleen turns the Spirit of wine wholly into a Salt.	733		56
Fishes made of water proved.	115, 29	G.	
Fishes helpful to Chastity.	667, 38	As, what it is.	69, 29, 71, 10, 106, 14
Fishes why long lived.	684, 93	What it retains.	109, 34
Fishes bring forth without pain.	685, 95	Galen ignorant of the causes of Ulcers.	321, 25
Fire no Element.	48, 9, 50, 1, 134, 24, 138, 35	Galen no Anatomist.	423, 43, 303, 32
It receives not its nourishment from the Air.	84, 16, 134, 24	Galen never knew Rose-water, Aqua vita, nor Quick-silver.	1083
It generates nothing.	109, 34	Galen's errors about Ulcers.	319, 14, 15
What its appointed ends are.	129, 26	Galen ignorant of the Latex.	378, 33
Its divers Inclinations taught by Positions.	136, 31	What the Gaul's use is in the body.	427, 74
Its being no substantial Body, proved by demonstration.	137, 33	The Gaul a vital Bowel.	211, 34, 1061
It is the Vulcan of Arts.	138, 38.	It performs its digestion by a fermental Blas.	214, 46
Actual fire cannot subsist in a mixt Body without consuming it.	1049, 18	The Gaul hath the nature of a Balsam.	216.
What a Flatus is, and its kind,	421, 34. &c.		53
Two irregular ones in us.	424, 50	It is taken so in Scripture.	ibid. 1041, 24
Whence they arise.	425, 61	From what the Gaul receives a ferment.	1048,
Where made.	428, 78		14
A Flint capable of retaining the solar light.	147, 95, 155, 35	The Generation of Fauns, Satyrs, Nymphs, &c.	681, 81
The Bloody Flux how cured.	475,	Generation of Trouts.	684, 91
	29	Generation of man described.	736, 737, 738.
The quality of food doth not hurt, except		Ginger produceth sweat.	250, 9

	Remedies

The Table.

I.

Remedies against Inchantmen's.	605
The Intellect is a formal light.	269.34
The nourishing of an Infant for long life.	797
	799
The property of Irish Oak.	150.5.
The faculties of a vein of Iron and what it performs.	700.7
How it profits in the stone.	701.12
Issues how they sometimes profit.	372.74
How the Author got the Itch with his practice on himself.	317.3, 319.9
Thirteen conclusions from the same.	318.7
Juyces how preserved uncorrupt.	461.21, 152
	172.45

K.

O F the wandring Keeper.	254
Why so called.	257.10
What he performs.	256.6, 258.24
How he Erreth.	260
His Restoring difficult.	261.43
How the Kings-evil is bred	251.24
A Remedy for the same.	252.26
Kidney Judge of the Dropfie.	512
It conveys the dropfie.	514
Kidneys differ the urine from the Latex, alone.	558
What it is brings peace to the Kidneys.	709.52
Kermes Examined.	972

L.

L Atex is not the urine.	509
Latex seperated from the venal blood Receives the disposition of an excrement.	512
Its ordination.	518
Latex what it is.	373.2
The distinction of the Latex from urine and sweat.	374.5
The absurdities that follow the Ignorance of the Latex.	Ibid. 9, 370
Of the several uses of the Latex.	375.12, 14
	18
The necessity of the Latex.	377.28
The vices of the Latex.	Ibid. 31
Latex easily receives a Forreign guest.	378
	36
Diseases arising sometimes from the Latex, how cured.	448.61
Laudanum without Opium cures several distempers.	543
Why the Land of promise hot.	86.27
Lead, how reducible into Gas.	102.23
Leprosie what.	895
What the Leprosie infects by.	900
Difficulty of its cure.	901
Of the binding of the Leprosie after curation.	1091
What Leffas is.	116.31

L.

Of the manifold life of man.	735
Of the middle life of things, &c.	150.8. &c
Impediments of life.	754
How the life of things is changed.	154.28
The middle life of things abides with us.	150
	158.53, 379.43, 1124
Of the spirit of life.	191
What life is.	740
What Resembles life.	752
Of light, &c.	135.24
Its beams being united is true and actual fire.	Ibid. 26
Tis to be understood of the Suns light.	139,
	40, 130, 36
It is No element.	Ibid. 37
The difference 'twixt it and the formal light.	144.73
Of its being retained in a flint.	147.95, 155
	35
Of the extinction of life.	159.59
What places most conduce to long life.	723.806
	810
Light in us is hot in fishes cold.	734.747
Of short Life.	747
What may occasion it.	754
Harmony of life from the Duumvirate.	306
	52
The Liver never hotter than needfull.	438.27
Liver not the seat of the Dropfie.	510
The shop of sanguification is not in the Liver.	214.42
It performs its digestion by a fermental Blas.	Ibid.
Of the different operation of the Loadstone.	762
The Medicinal faculty of the Loadstone.	763.19
Loadstone dir. As it self but is not drawn.	773
	64.774, 67.775.68
The properties of the Loadstone laid asleep by Garlick.	774.67
The same performed by Mercury.	Ibid
Why glassmakers use the Loadstone.	787
	143
Logick deciphered and Condemned.	32.5, &c.
	67
Long life Impeded by Milk.	797
What Love is.	719, 722
Love is before desire.	720
The excellency of love-desire.	314.19, 21, 23
A Lunar Tribute.	740
Ludus its preparation and where to be found.	881, 882
The original of the Lues venerea.	1092.1903
	1094
Lues venerea consists not of matter but of a fermental odour.	1094
Carnal Lust not from the Reines.	305.42
But from the stomach.	Ibid. 43
The diseases of the Lungs whence they arise.	440.39
	With

The Table.

L.

With what their Ulcers are cured. 441, 43
 Why they disburden themselves by spitting. ibid. 45
 They are unmoveable. ibid. 442, &c.
 Their use. 444, 49
 The vanity of Ecligmas in these distempers. 445, 54.
 Burdened by perfumes. 446, 55
 A corrupt Imposthume in them broken attended on by death. 449, 63
 Their difficulty of cure. 260, 41
 Remedies applied to the head for the Diseases of the lungs unprofitable. 357, 3, 4

M.

Sign of madness. 297, 1054, 11
 Concerning madnesses. 966, 287
 The first and second degrees of madness. 278, 30, 279, 38
 The occasion of madness in the Mariff. 981, 273, 5, 276, 287, 29, 297, 2, 307
 Madness not cured by Opiates. 629, 307, 56
 Madness difficult to be understood. 277, 24
 Why a mad man feels no cold. 280, 43
 How madness is propagated by biting, &c. 144, 76
 'Tis not proper to the mind. 145, 70
 Of the cure. 281, 47, 48, 49, 282, 52
 Maiden hair good against Inchantments. 605
 Where the Magical power in man is seated. 780
 The Magick of man when most powerful. 781
 The first degree of power dwelleth Magically in the forms of the three principles. 788, 152
 Of the Magick of Bruits. 789, 155
 Humane imagination the foundation of Natural Magick. 791, 168
 Magisteries commended. 480, 54
 Of the Magnetick faculty. 614
 Marrow more in old creatures then young. 748
 What Magnum Oportet is. 153
 The power of Magnetism. 762, 11, 763, 21
 Magnetism not superstitious. ibid. 14
 What diseases have been cured by Magnetism. 763, 20
 Virriol dies through Magnetism. 764, 21
 The Magnetism of Mummy proved to reach from Italy to Brussels. ibid. 23
 Of the Magnetism of the Carline Thistle. ibid. 24
 The Magnetism of Philtrous Mummies. 27
 The magnetick force of Arsmari, Camfrey, &c. in curing Ulcers. 765, 29
 Asarabacca and Elder are magnetical. ibid. 30

M.

Of the Mammial magnetism impressed on a Chair. ibid. 33
 The Saphir an Imitator of the magnetick Unguent. 766, 34
 Magnetism is a heavenly quality. 768, 40
 God approves of the Magnetism of the unguent by Reliques. 769, 47
 How glass becomes magnetical. 774, 65
 Rosin magnetical. ibid. 66
 The cause of Magnetism in the Unguent. 776, 71
 When the Magnetick Unguent is brought into action. 777, 78
 The Magnetism of the Eagle. 778, 82
 By what the power of the Magnetick unguent becomes efficacious. 784, 121
 Magnetism not exercised by Satan. ibid.
 Spirits the Patrons of Magnetism. 786, 138, 788, 150
 The Magnetism of things are made by a natural sensation. 787
 How Magnetism differs from other properties. 789, 159
 The virtue of the Magnetick unguent from the composition, not the phansie of the Composer. 792, 172
 The Magnetism of Red Coral. 1147
 The definition of a Man. 21
 Man in his whole substance the Image of God. 718
 How he hath a likeness of the Heavens. 749
 The medicines of the shops vain. 431, 10
 The property of a true one. 451, 5
 Its extent. 460, 20
 Medicine the most occult and intricate of Sciences. 538
 Purging deceives the unwary. 556
 Force of medicines in their odour. 593
 In what the virtue of a medicine is seated. 177, 42
 Metals, why hard to be reduced, &c. 49, 12
 When reduced, they have in them Planetary virtues. 478, 41
 Of the internal Mercury of metals, and its property, &c. 65, 8
 Mercury's wonderful property the outward Sulphur being severed from it. 66, 14, 410, 58
 It hath an internal preservative sulphur. 67, 17
 The simplicity of the Mercury of a Metal. 410, 53, &c.
 Why Mercury is immortal. 410, 59, 60
 The mouth of the Stomach dedicated to Mercury. 1132
 Of Mercurius vitæ. 479, 44
 Memory why placed in the head. 304, 35
 Memory what. 718
 Menstrues their description, use, &c. 740, 741, 742, 743
 What the material cause of a Meteor is. 74, 27
 Metallus

The Table.

The Table

Sharpness not the vital Ferment of the stomach.	208, 131	Why stones are sometimes white.	710, 56 248, 28
What it is.	210, 29	Whence a three-fold stone is made.	249, 3
The stomach doth not coct first for it self.	216, 52	Of the Stone.	828
The stomach first sensible of any defect.	285; 13, 14, 287, 26	The flux of seeds for a stone.	829, 706, 26
The stomach of the liver.	209, 20	After what manner a man is made a stone.	833
The stomach of the gaul.	ibid	Of the Coagulum and Runnet of the stone by handicraft operation.	840
Sobriety commended.	452, 16	Salt profitable in the stone.	843
Seat of diseases in the sensitive soul confirmed.	559	Of the occasion of the stone.	857
The seat of the sensitive soul.	555	Of the womb of the stone.	866
Of specificall savours.	473, 25	Its Situation.	867
Two savours, one of the tongue, the other of the stomach.	474, 27	The pain of the stone from a contracture.	86
Spleen the maker of seed.	305, 42	Of the intention to cure the stone.	701, 15, 874
The situation of the Spleen.	540	Its cure.	878, 879
It is the fountain of Ideas.	606	With testimonies thereof.	ibid.
Against black choler in the spleen.	964, 31056	Of the manner of ministring a remedy for the stone.	883
The defect of the spleen is the cause of the Strangury in old people.	1061	Of the stone that maketh gold, & its projection.	674, 58, 751, 807
A double ferment in the spleen.	1055	The stone that maketh gold, hath not the blessings of the tree of life.	807
The spleen inspires a digestive ferment into the stomach.	298	Sulphur only resists a fermental poyson.	1158
The spleen most enriched with Arteries.	ibid.	In Sulphur is the life and death of bodies.	66, 14
Of the stomach of the spleen.	299, 13	Sulphur boiled in Linseed oyl.	427, 70
Of the external spleen of an Infant.	306, 49	In oyl of Turpentine.	515
How the soul thinks intellectually.	23, 48	The whole band of diseases hearken to some Sulphurs.	577, 260, 39
It is substantial.	144, 70	The Sulphur of Copper, hot, stupefactive, yet sweeter then honey.	304, 39
Its power when freed from corporeal contagion.	144, 75	How stoures of Sulphur profit those that have a Cough.	309, 94
What the sensitive soul is.	145, 82	Sulphur commended against the Plague.	1154
Soul acts in the body per nutum.	780, 97, 784,	Of the Gas of Sulphur.	1155
The soul generates Entities.	785, 131	The Sun scorcheith without pain.	72, 14
Soul sits in the Duumvirate.	301, 22	Is hot.	74, 23, 139, 41, 794
Sharpness is the specificall mean in the stomach.	115, 34	The gifts of the Almighty are placed in the Sun.	796
It differs from all other sharpnesses.	193, 10	Sugar hurtful in most diseases.	462, 30
Stones and Rocks reducible into their equal weight of Salt.	411, 65	Loaf-Sugar not so good as the common.	467, 57
Whence the Strangury in old people is.	855, 624	Swooning from the Stomack.	302, 303, 27
What the Stars shew forth, &c.	122, 21	What that Sweat is that accompanies death and Swoonings.	42
How they operate.	121, 14	What the Synovia is.	842, 389, 20
How they necessitate.	123, 30	Of Sympathetical Mediums.	616
The difference betwixt the Planets and the fixed Stars.	125, 40	The cause of Sympathy.	775, 68
How a wise man rules over them.	126, 46	Of the Sympathy and Antipathy of things.	1114
The Stone in man not made by the intention of nature.	250, 5		Tast
Of the causes of the Stone, according to the Antients.	705, 1		
Of their Intentions to cure, and by what.	ibid.		
Their despair.	ibid.		
Why they have erred in the cure.	706, 12, 708		
Heat of the reins, not the cause of the stone.	707		
An example.	ibid		
How the Antients remedies may profit, though not cure the stone.	708		
Why an expulsion of the stone is not to be intended.	709		
The quality of a remedy resolving the stone.			

The Table:

T.

T *As* in the midriff. 909
T *artar*, its distillation. 412, 68, 427, 68, 183, 39
Why salt of Tartar dissolves crude Tartar. 234, 19
How Tartar is made. 233
No disease arises from Tartar. 235, 1
Tartar not in foods. 241, 8
Tartar after digestion in the stomach ceases to be a Tartar. 242, 243
Tartar not in drinks. 250, 7
Of the Tartar of the blood. 1103
Of the original of the Tarantula. 1509
The poison of the Tarantula. 787, 148
What thirst is, and whence. 471, 8
Thorn in the flesh how cured. 521
Of thunder. 90, 17
A preservation against its effects on Beer, &c. 91, 21
The seat of the Timpany and by what it is made. 520
Why Tin is lighter than other Metals. 107, 20
The Toad commended against the Plague. 1149
How prepared for that use. 1150
How it kills the Ferment of the Plague. 1151
How quickly he dies with fear. lbid.
The Toad given by God as a Remedy for the poor against the Plague. 1152
The bone of a Toad cures the tooth ach
Tooth-ach whence caused. 438, 30, 247
Of the original of the tooth-stone. 246
Of the flourishing and decaying of teeth. 247
How the Transmutation of bodies is effected. 25
The tree of good and evil why forbidden. 115, 23
Of the tree of life. 664, 665, 666, 680
Tree of life what qualities it ought to have. 745, 753, 754, 755
The Cedar tree doth signify the tree of life in this world. 808
Of the preparation of the Cedar tree. 810, 811

How the Toad is prepared for a Zenexon.	1150
Why he is a true Zenexon.	1152

A

A Poetical Soliloquie of the Translatour, Harmonizing and Sympathizing with
the Author's Genius.

When first my Friend did ask me to translate,
Van Helmonts Works wrapt up in hidden state,
 Of Roman dialect; that 'twas a Book
 Of Med'cine and Phylosophy, I took
 It in good part enough, and did not doubt
 But to perform what I should set about,
 By Gods assistance; for I willing stood
 Much pains to take about a publick good.
 I forth with entred on it and did see,
 More than my friend, thereof, could tel to me:
 For why, since something was begot within
 My inward parts which loved truth, but sin
 And selfish error hated, I began
 To feel and love the spirit of the man,
 Whom I perceived like a gracious Son,
 To build his knowledg on the Corner Stone;
 And out of self to sink in humble wise,
 As his Confession in me testifies.
 The light of understanding was his guide,
 From heath'nish Books and Authors he did slide;
 And cast them of, that so he might be free,
 Singly to stand; O Lord, and wait on thee,
 And in the pray'r of silence on thee call;
 Because he knew thee to be All in All,
 And thou didst teach him that which will conduce
 To th' profit of his Neighbour, be of use,
 Both unto soul and body, as inclin'd
 To read with lowly and impartial mind:
 But as for lofty and self-seeking ones,
 Thou scatter wilt their wisdom, wealth, and bones:
 Because thou art not honour'd in a lye
 Whether of Nature or Divinity:
 But in the truth of knowledg of thy Life,
 And of thy wondrous works which men of strife,
 And alienated, can no whit attain,
 Till from the fall they do return again.
Helmont, that thou returned'st I believe,
 Thy testimony of it thou dost give,
 When by the light thou saist (entering thy dore)
 Thou changed wast from what thou wert before:
 And 'cause thou suffredst by a wicked sort
 For being good, and once wast poyson'd for't:
 That 'twas unjustly, I am doubting past,
 'Cause th' Enemies conscience prickt him at the last,
 And truly in many places of thy Ream
 Words flow forth from thee like a silver stream;
 And so, that I at sundry times have found,
 Sweet op'nings from the un'ty in the ground.
 But did thy life in words alone consist,
 Or art thou to be enrowl'd among the list
 Of Stoical Notionists, which only spend
 Their time in contemplation, and so end
 Their days; or were good actions wrought by thee,
 Which (as the fruits discover do the tree)
 Did shew that healing virtue forth did start
 From thy fire-furnace, as love from thy hart.
 If not, how is it that thou dost us tel
 Thou ceased'st not Annually to heal
 Some Myriades or ten thousands, yed
 Thy medicines were not diminished

Or that thou wert so tender of the poor,
 (What if I say that begd from door to door)
 That thou retiredly didst live at home,
 And cure them out of Charity, not Rome
 And gape for gain for visits, as do most
 Physicians who unto rich houses post;
 Floating about even as in a flood,
 Of poysoned purged filths and venal blood;
 And so the peoples wealth, health, life do soak,
 Through the Gay vizard of a Doctors cloak:
 But *Helmonts* hand-pen as it plain appears,
 Their false-paint coverings a sunder tears:
 In room whereof, such Practick, Theory,
 It doth insert, that they as standers by,
 (Like Babels Merchants) will vex, weep and wail
 When they shall see their trade begin to fail,
 And upright Artists held up by the hand
 Of him who owns the good Samaritan.
 Yet such School-Doctors shall not thus relent,
 Whom Grace and goodnesse shall move to repent.
 This is not utter'd out of spleen but pity,
 Unto the sick in Country and in City:
 No just cause given by these words to hate,
 But to be owned by the Magistrate.
 And I my self in former silly times,
 Through School-tradition, and Galenick lines,
 Have wrong'd my body, weaken'd my nature,
 Clipping my vitals in their strength and stature;
 And though, through Grace, to soul and body too,
 'Twas turned to good, yet that's no thank to you.
 Help Chymists help to pul their Babel down,
 Built by the pride of Academicks Gown;
 Let *Theophrastus* Azoth, *Helmonts* Lore,
 Erect an Engine such as ne're before.
 Hark Chymists, hark, attend Baptista's law,
 He speaks to h's Sons, as th' Lyon by the Paw
 And why as th' eye is opened to look,
 May y' not discern *Hercules* by his foot?
 Be it sufficient that he gives a tast,
 Least pretious pearls he unto swine should cast.
 Be't no dishonour to the Chymick School,
 That some mistakes thereof he doth controul:
 Rather a praise unto the Masters eye,
 Household disorders for to rectifie.
 Strike Chymists strike, strike fire out of your flint,
 And force the fire unto the highest flint
 Of a Reverberatory, such a heat,
 As *Galen* back out of the field may bear;
 And fetch th' Archeal *Craffs* *Seminum*,
 To keep the field gainst a *Relolleum*.
 Strive not nor by reason if you'd win the day,
 Place your *Athanas*, as he, another way:
 Aime not at lucre in what ye undertake,
 Your motive love, the spirit your guider make:
 That day to day in you the Word may preach,
 And night to night unto you knowledge reach:
 That so *Elias* th' Artist, if he come,
 Ye as prepar'd, may bid him welcome home.
 And all well-wishers unto Science, true,
 Unto whose hands't shall come this Book to view:
 See that your hearts are simple to the pure,
 No filthinesse true wisdom can endure:
 The milky way must be the paper here,
 And th' Inke Nectar from th' Olympick sphere:

And

And then 't may open unto you a path;
 For finding that which long been hidden hath;
 For there's a way by Simples for to cure,
 Unto Simplicity the nearest sure;
 If not Antiquity, as Scriptures note;
 Solomon for 'n example may be brought.
 The Author opes a gate in that Divine
 Chapter, that treats o'th power of medicine.
 And not a little of *Moses* Cabalism
 He hinteth at that in of Magnetism:
 So truly doth the Saviour report,
 That to the carkass Eagles do resort.
 In former time, thy younger learning years,
 Thou as a tender heart, yet void of fears;
 People that had the plagues infection;
 Didst visit, and by them wert spew'd upon:
 Some breathing forth their life within thy arms,
 Unto thy grief, because thou then their harms
 Wert not so able to repair, untill
 Thou hadst attain'd a great Adeptist skill:
 For thou by Revelation dost show,
 What *Corus* us'd two thousand years ago.
 All which supposed, I can freely wink,
 At some mistakes whereby thine eye did blink,
 As to Religion, because thou wert
 Hone st, upright, sincere, and sound in heart:
 For if the folly of them thou hadst seen,
 As other things deny'd by thee, they'd been.
 And if in Nature thou art ought mistaken,
 Thy many truths are not to be forsaken;
 For why ye Schools, ye cannot, neither dare ye
 Deny, but that *humanum est errare*,
 Until the minds perfection in the Light,
 Which he believ'd, yet would not claim it quite:
 And so his candour is to be commended,
 In not assuming what God had not ended.
 Yet know that where one truth is you among,
 In *Helmouts* breast there lodged ten for one;
 And that not taken up by hear-say trust,
 As ye are wont, but stamped by the Iust:
 For Reason Dialectical, he saith,
 Must vail the Bonnet unto light in faith:
 Sith Reason favours of an earthly soil,
 Dies with the sense, our Parents did beguile:
 And therefore Logick may no longer center
 Within mens minds as Sciences Inventer.
 And Nat'ralists must needs go to the wall,
 As those of *Athens* in the daies of *Paul*;
 Since that four El'ments, Humors, and Complexions,
 Are proved plain to be but childish fictions:
 Which *Ethnicans* by phansie blind misled,
 Have rashly plac'd in seeds and ferments sted.
 This is some liquor pour'd out of his bottle,
 A deadly draught for those of *Aristotle*.
 Astrol'gers also will be soon undon,
 Since *Herm's* and *Venus* circle with the Sun:
 And since the Planets common Ordination,
 Was to stir up a Blas for seasons Station:
 And since the Heavens can no forms bestow,
 To th' Prince of life all creatures do them owe.
 Ye Theologians, look what will befall ye,
 Since man is not defin'd by [*Rationale*]
 But by a Spirit and Intellectual light:
 Now every one may see by his own sight;

And

And living waters out's own Cistern drink,
 Need not hew Cisterns that do leak and chink:
 Nor tug with pains to dig for earthly Wells,
 The Spring's within him, as Christ in him dwells:
 Nor run to Temples that are made with hands,
 Himself's the Temple, if he contrite stands.
 And cause a New-birth is requir'd of all,
 Since brutal coupling entred by the fall;
 And so your followers can't be reputed
 Christians by birth, nay, but must be transmuted:
 And since the mind of man may be compleated
 In this lifes time, as sin and self's defeated.
 Since Char'ty not to dwell, by many's known,
 In those that with the letter up are blown:
 For as from mud ordung ascends a stink,
 So Pride from Learning sent up like a sink.
 He did refuse to be a Canon great,
 Least (as saith * B.) he peoples sins should eat.
 What will protracting crafty Lawyers doe,
 Since Christ against them hath denounc'd a woe
 He would not b' a Professor of the Law,
 Enough for man to keep's own self in awe:
 And what will come of Atheists, since 'tis true,
 That there's a Power Eternal (who in lue
 Of fallen Angels) did mans Soul create
 (In mortal body an immortal state.)
 To live in h's hand in weal or woe, as they
 His call of Grace shall or shall not obey.
 What of curst Hypocrites who in deceit,
 Take up Profession for a Cloak and Chear;
 Better for Sodom and Gomorrah than
 For such, when Christ doth come the world to fan.
 But stop my Genius, run not out too far,
 Although thy shackles much unloosed are,
 And virals subtil, while thou tell'st the story,
 Of what concerns mans good and God his glory;
 Least Prince of th' Air like Poets Pegasus,
 Prevail to make thy wit ridiculous,
 By mounting thee too high upon his wing
 Of fleshly pride, and *Aelus* thee sling
 Down from the quiet Region of his skie,
 In the *Icarian* waters for to die,
 Or whirl thee higher in his stormy hail,
 And sting thy conscience with the Dragons tail:
 For if an inch be given (so they tell)
 It is not safe for one to take an ell.
 Wherefore retreat in time of thy accord,
 Least thou incur the anger of the Lord:
 And throw thy self along down at his feet,
 After the Author thou shalt once more greet.
 I b'lieve thou wert a Medel-master made,
 By the Creator of the Root and Blade
 Of healing virt's, the Father of lights (I sing)
 Whence every good gift doth descend and spring.
 Thou livedst well, and in the Belgick Nation,
 Wert a tall Cedar in thy Generation:
 A good memorial thou hast left behind,
 Of what in daies now coming, men shall find
 Writ in Christ's Bosom, and in Natures spread,
 As they are worthy in those books to read.
 Thou diedst in peace in *Anno* forty four,
 I doubt not but thou liv'st for evermore.
 My friend is also gone, yet I survive,
 Lord grant that to thine honour I may live:

LIIIIII

And

And as my life thou gav'st me for a prey,
 When in a gloomy and despairing day,
 I thought I should have died without the sight
 Of thy Love-tokens, and thy face so bright;
 So I intreat upon my prostrate knee,
 That I thy way and Cross may never flee:
 Than turn a-new unto Apostasie,
 Or thee dishonour, rather let me die,
 Than to depart again out of thy fear,
 Better wild horses me in pieces tear:
 If the remembrance dwell not in me rise
 Of thy great goodness, pity of my life.
 But as large mercy is to me extended;
 So what is faulty may be fully mended:
 That perfect righteousness may cloath my back;
 And I to sound thy praises will not slack,
 In life, or death, or suff'ring by the world,
 Who in transgression up and down are hurl'd;
 And Tophets pit shall surely help to fill,
 If they in time repent not of their ill.
 But as he did for's en'mies pardon cry,
 So do all Christian hearts, and so do I.
 O holy, holy, holy, holy God!
 Whose Name's exalted in th' Ascendant *Jod*;
 My self doth tremble, and my flesh doth quake;
 While I the King of Saints my Subject make:
 I dread thee Lord, I dread thy Sov'raign fame;
 I love thee so, I can't express the same;
 My Spirit's on fire, and my heart doth flame,
 With a desire to sanctifie thy Name:
 My Soul is melted, and my heart is broke,
 In feeling of the force of thy Love-stroke.
 Father I thank thee that thou didst enable
 Me to convey the dish from *Helmonts Table*:
 And if some crums or drops have fell beside,
 'Twas what a careful servant might betide:
 It being weighty, full of divers fare,
 If none should over-fall or flow 'twere rare.
 A Corydon I h'd rather some me deem,
 Than t' use dark-phrases that would not be - seem
 Rather a Tautologian be dained,
 Than to the meanest, leave words unexplained:
 Rather a home-spun Patcher wanting *Art*,
 Than th' Authors meaning willingly pervert:
 And if his tongue could speak out of the dust,
 Hee'd justifie this Translate all almost:
 For though his learned *Art* I don't comprize,
 Yet in the Root our Spirits harmonize.

The Dish lost somewhat of its crums and drops,
 As it was carried through the Printing Shops;
 Yet what the Press hath nipt off by the way,
 It here returns again by this survey.
